GOOD WORDS FOR 1876

THE STORM OF LIFE.

BY HESBA STRETTON, AUTHOR OF "JESSICA'S FIRST PRAYER," ETC.

CHAPTER I.—A FRAIL BARQUE.

were but just past their shortest, and night-fall came too soon for busy workers. The old year was not quite ended, and Christmas Day was not yet forgotten, with its good cheer and merriment. Even in the jail at Thornbury there had been a Christmas dinner, and the prisoners' dismal chapel had been decorated with green ivy and the red berries of the holly, bringing back to their minds memories of their childhood, before sin had laid its heavy hand upon them; when they too had gone carol singing through the frosty lanes, between leafless hedge-rows and glistening snow-drifts. A strange clergyman

had preached to them on Christmas morning; he had looked down on several drooping heads and faces hidden behind trembling hands, especially among the female prisoners, whose hearts were most easily touched by thoughts of old Christmas days and their innocent pleasures. He had never preached from a prison pulpit before, and his voice faltered and his heart yearned with pity over the outcasts before him; his Christmas Day was saddened. But he was a stranger; the prison chaplain, who was absent through illness, had grown used to the sight of all those hard, unhappy faces, which looked at him from the solitary pews, where each one sat alone in misery and degradation.

Christmas Day was over, but New Year's Day was yet to come. To-morrow would be the last day of the old year. Probably there was but one prisoner who took any notice of the date. There was only one whose term of punishment was ended on the last day of the year. She had placed a little box on her stool, and was standing tip-toe on the top of them, just reaching above the high window-sill with her eyes, as she gazed eagerly at the setting sun. She could see nothing save the sky, with its pale wintry blue, and the low, red bank of clouds under the sun. There was not a speck of ground visible to her, or any trace of dwelling-places and homes, of which there were thousands in the town close by. There was the sky only, and that was growing dark. The bare little cell behind her would soon be filled with the darkness, and no light would be allowed for an hour longer. She could hear a robin singing somewhere out of sight, and once a rook flew with heavy wings across the field of sky on

which she gazed through the narrow window of her cell. "To-morrow!" she murmured to herself, "to-morrow!" She would be free again, like the birds, to-morrow. Early in the morning the great gates which had closed so heavily upon her would open again and let her out, to choose her own way and follow her own path. —

She could not stand long on the high post she had climbed to, holding on by her prison bars, though she wanted to see the sun go down behind the bank of clouds. How terribly long the coming night would be! It seemed impossible for her to pass through its dreary hours patiently. Her task was finished, the last prison work she would have to do. Yet if she had a violent outbreak now, such as she had yielded to during the first year of her imprisonment, that would bring some days, perhaps some weeks more of confinement. She recalled to her mind the dark cell in which she had so often been buried, before her wild ungovernable spirit had been tamed into obedience. That dark, terrible cell, where no welcome sound broke the silence, and no ray of light stole in to divide the day from the night! If she should get in there to-night, the last night of all, what would become of her? It would drive her into madness; there would be no chance of keeping her wits; she must keep herself calm and quiet now.

But how was she to do it, with her heart beating, and every pulse in her head throbbing, till she could not keep herself quiet for a moment? After a minute or two of restless exhaustion, she climbed up again to bring her eyes once more on a level with the window-sill. The sun had just sunk behind the clouds, and the clocks in the church towers in the town below chimed half-past four o'clock. Only half-past four, and she could not in any case be set free before eight the next morning. Fifteen hours and a half! They seemed as long as so many weeks—longer than the weeks had seemed only three or four months ago. It was only of late that the days had dragged so heavily, and her patience had been more sorely tried than before. In the last three months the prospect of her release had made prison work and prison rules more irksome to her, though she had not shown any temper or impatience either to the warder or her friend the chaplain. But to-night the storm grew worse and worse. How could she fight against it till the morning came?

"Help me! help me!" she whispered through the bars of the window to which

she clung. She scarcely knew to whom she was crying. She was straining her eyes to look up into the pale sky where the evening clouds were gathering; and it seemed to her, excited and disturbed as she was, that a face looked down upon her out of the dimness—a sorrowful, pitying face, with a crown of thorns about the head. Only for one moment: her eyes lost sight of it instantly. But she crept down from the window-sill, and, crouching upon the floor beneath, covered up her face and cried softly and quietly to herself.

By-and-by her quick ear caught the sound of footsteps treading the long corridor outside, and they ceased before her door. She knew some one was peering in through the grated hole in the door, through which she herself could be watched at any hour of the day or night. It was almost dark in her cell now, but she had quickly sprung up from her crouching attitude, and was sitting on the stool, with her hands folded on her lap. She heard the key turn almost noiselessly in the lock, and her warder entered with a carefully-guarded lamp and lighted the gas, which, like everything else in the dismal place, was kept under lock and key.

"Rachel Trevor," she said in a pleasant voice, "the time feels long to you now, doesn't it? It's hard work waiting for to-morrow."

"Ay, it is," sobbed Rachel. "I feel as if I'd be sure to die before to-morrow comes. Stay with me a little bit, ma'm; do, please. Talk to me a minute or two; for I'm sore afraid of breaking out at the very last of all, or goin' stark mad. I'm trying hard to be quiet and peaceable, but I can hardly bear it."

"I'll give you something to think about that will help to keep you quiet," said the warder gravely. "Rachel, the chaplain's dead!"

"Dead!" she cried. "No, no! not dead! Don't say he's dead!"

"Yes, we've lost him," said the warder; "he was a good friend to you, ay, and all of us. He died on Christmas Eve, just as they were singing carols under his window, and all the bells ringing. It was at his old home where he was born. We didn't hear about it for a day or two. He had a letter written for him when he lay a-dying, to be given to you, Rachel, the night before you went away from here. You can read it for yourself alone; for he told him that wrote it to write it large and plain, so that you could make it out for yourself."

"It was him taught me to read, and write too," sobbed Rachel, "I've lost my only friend. He cared for me when I was worst. Oh! what shall I do? What shall I do?"

"Haven't you any friends to go to?" asked the warder.

"I haven't had a friend to ask after me since I was sent here," she answered, "not one. My husband—he was sent to Gibraltar for ten years, you know. And there's my little Rosy—she's in the workhouse at Aston; I shall go and take her out to-morrow. She's such a little beauty. I hope they've never told her where her mother's been all this while! But I haven't a friend in all the world now."

"Dear! dear! that's bad," said the warder, sighing.

She did not know what else she could say. Now the chaplain was dead, there was no one she knew of who would think of stretching out a hand to help a woman just out of jail, after a long term of imprisonment for house-breaking. The crime had been a particularly daring one, and Rachel had taken a foremost part in it. Who would think of employing such a woman, whose husband was still in penal servitude?

"Dear! dear! that's very bad!" repeated the warder.

"Ay! it is," said Rachel, absently. She was holding the chaplain's letter between her hands, and the tears were falling fast upon it. He had been her only friend; and now, at the very moment when she needed him most, she had lost him. Yet her sorrow was, that she should never see him again, and never speak to him as a free woman; she scarcely thought of the help he would have given her, in beginning a new life outside the jail. He had come so often, and so patiently, to her cell, lightening the heaviness of her long imprisonment, and bearing with her stupidity and temper, and now she could never show her love and gratitude to him! She had wanted to bring her little Rosy for him to see, as soon as she was out of jail. She had loved him, and longed to be good that he might be glad; and he would never know it. Now he was gone for ever, and she was left alone, to be good or wicked, happy or miserable, with no one to care for her.

"Well, well!" said the warder, "read your letter, and I hope it will comfort you."

CHAPTER II.—UNDER SAIL.

As soon as she was alone in the cell, Rachel opened her letter with trembling fingers. Her eyes were dim with tears, and

she could not read it readily, for it was only within the last two years, that, to please the chaplain, she had set herself to learn to read and write. But after long poring over it, and spelling over and over again many of the words, a glimmering of what the letter meant broke faintly upon her mind.

"DEAR RACHEL TREVOR,—I am dying, and you will never see me again. I have been your friend; but now you must turn to a Friend who will never be taken from you, and who will never forsake you. Remember that Christ, my Lord, came to seek and to save those that are lost. You know you are lost; He is seeking you, and He will save you. Keep in mind that He is always at your side; a Friend who will grieve and mourn over you, more than I should, if you fall again into sin. He died to set you free from sin, and to open the gates of heaven for you. My poor Rachel, can you sin, with your Saviour's eyes looking on? Can you utter wicked words, whilst He is listening? Oh! if I could only make you feel, what is true, that Jesus sees and hears all that you do and say, I should be sure you would not grieve Him.

"You cannot have an easy happy life, such as it might have been, if you had not fallen so low. You have made your life more stormy, and more difficult, than God meant it to be. But through all the storm of life, Christ will be beside you, and He will save you, if you trust Him. Die rather than give way to sin. The storm will be over by-and-by, and you will come home to God, whither I am going now. One word more; learn to say to yourself, wherever you may be, 'Thou, God, seest me! Thou, God, seest me!'

"I love you, Rachel. Christ loves you. God loves you. Be good."

Half aloud, with sobs breaking in between the words, Rachel spelt through this last letter from her friend. The hours did not drag by heavily now; she was no longer afraid of an outbreak. She knelt down, with the letter in her hands, feeling as if God would be sure to listen more willingly. But she could say nothing save, "Thou, God, seest me!"

She had never been sure of this till now. God had seen her through all her wild and wicked life, with its thousands of wicked days and sinful nights. There was hardly an hour she could look back upon, since her early childhood, which had not been blackened and disgraced by her own vice, and the

vice of her chosen companions. She had followed her own way without hindrance; and it had been a very bad way. At this moment she was a prisoner, suffering the penalty of her crimes, without a friend in the world. And God had seen it all!

It had been a terrible moment to her when she heard the jury utter the word, "Guilty," and when the judge had condemned her to her long punishment. But now it seemed a hundred times more terrible to think of appearing before a Judge whose eye had been upon her all her life long, and who needed no witnesses of any kind to tell Him every sin she had committed against His good and just laws. Her conscience was fully awakened. This letter, which had come to her from one who was dead, her only friend, spoke to her more powerfully than the chaplain's living voice had ever spoken. "Thou, God, seest me," she whispered; and that God heard her whisper she knew in her inmost heart.

They were the last words she uttered before she fell asleep, and the first when she awoke in the morning. The prison bell aroused her as usual, and she lifted herself wearily from her hard mattress to begin another day of prison-life. But that was only for an instant. The glad thought flashed, like a sudden gleam of light, through her heart, that to-day she was free, to-day she would see her little girl again. The warder brought a bundle containing her own clothes, and carried away her prison dress. How her hands shook, as she unfolded the gown she had been wearing when she was taken up for the crime she had committed. All the long years seemed to be wiped out like a dream when one awakes. The blue dress, with that little hole torn in it, which Rosy had made whilst romping, how familiar, yet how strange it was to her! She had always been fond of gay colours and smart dresses; and now she had her own clothes again, she felt quite a different woman from the dull, broken-spirited prisoner she had been only yesterday. There was no glass in which she could look at herself; she had not seen her own face all this long and dreary time, except in little fragments of broken glass in which she could hardly see the faintest image of herself. But she felt as young, now she had her blue gown on, as when she had first crossed the gloomy threshold of the county jail.

There were a few necessary forms to go through, and the governor of the jail addressed some words of friendly counsel to

her, before the prison gates were opened; but she scarcely heard what he said, for there was a singing in her ears, and her heart was beating painfully. There was a small sum of good-conduct money for her, which she had earned since the chaplain had come; and to it was added a sovereign, which had been sent to her as a legacy by her dying friend. It was enough to meet her immediate wants. She took the money mechanically, forgetting to utter any thanks. It seemed so long before she could get outside the strong, thick walls! But at length all was over. The great gate swung on its hinges to let her out; and in the chill, keen air of a December's morning she stood outside the jail, free once more.

Just at first Rachel felt giddy and faint. She had not been able to swallow a morsel of her breakfast; and the frosty air seemed to smite her back against the high walls that surrounded the jail. There was no one about to stare at her. The gloomy place stood a little way from the town, upon the high banks of a river, which was flowing sluggishly along its course, under a thin coating of ice. For miles away a level plain of fields and meadows, hedgerows and woods, glistening with snow, stretched up to the dim-coloured sky. It was going to be a hard, dry, frosty day, with a pale sunshine struggling through the gloom. Rachel's eyes were dazzled by the glare of the snow, as she gazed eagerly across the white plain in the direction where Aston lay. She knew the long way well enough. There were ten good miles to march before she could snatch up her little Rosy into her arms and hold her close, close to her breast, with the soft cheek pressing against her's, and the tiny hands clinging round her neck. There had never passed a day in the jail, even in the dark cell, that she had not thought of the time when she should see her darling once more. What was the use of lingering under the prison walls? The sooner she started on her journey, the sooner her child would be her own again.

She shrank from passing through Thornbury, where she might, by chance, come across somebody who had known her when she used to come to the weekly market, with her mistress' butter and eggs. So she went down a long flight of steps to the river-side, and followed its windings, as long as its course led towards Aston. The narrow pathway was rough, yet slippery with ice; and she had been so long unaccustomed to walking, except round and round the dismal exercise-yard,

with its smooth flags, that her feet soon grew weary. But she pressed on, though slowly, wondering how Rosy would look when she saw her mother again. Rachel did not think of any change in her. She could only recollect the rosy little face, the small, dimpled hands, and curly golden hair of her child. She had been passionately fond of her baby; and the bitterest part of her punishment had been losing her. But it was all past now; and never again would she run any risk of being parted from her little girl. She was entering upon quite a new life.

But the road was very long and very rough. She was getting nearer, moreover, to a neighbourhood where anybody might know her; and whenever she could turn out of the high-road, she chose the fields, where the uneven furrow, and the tufts of grass, frozen hard as iron, tripped up her weary feet at every step. She was hungry too, and the biting wind crept in under her thin summer jacket, chilling her to the heart. Yet her heart was glad in spite of all. She was free, and she was going to claim her child.

There was no spot where she could rest, even for a few minutes, under the frosty hedgerows; but when she was about three miles from Aston, she saw a woman unlocking her cottage-door, and she asked leave humbly to sit down by her fireside for a little while. It was a clean and cosy house-place, and Rachel looked round it with longing eyes. If she had but a home like this to take her Rosy to, how happy and how good she would be!

"Are you bound on a long journey?" asked the woman, as she stirred up the embers of a low fire.

"Only as far as Aston," answered Rachel, "but I've been on my feet all morning, and I'm not used to it of late, and it's worn me out. I've walked from Thornbury, and I don't believe I could have gone all the way without resting a bit, and thank you kindly."

"Ay, rest is sweet," said the stranger; "have you friends at Aston?"

"Only my little girl," replied Rachel, her face flushing with gladness, "but she's such a little love! Like that picture of the angel there hanging by your clock. I've not seen her for years and years."

"Not seen your own little girl for years!" repeated the woman in amazement. "Why, how comes that about?"

"Oh, I've been away," she said, "and it's a hard thing for a mother to be parted from her child all that while, isn't it?"

"It's a long while," said the woman suspiciously.

"It'll never happen so no more," said Rachel, in an eager voice, "never, never again. It were my husband's fault mostly. Men are so; they don't care for their children like we do. He never gave a thought to what would become of Rosy."

"Is she living in the House?" asked the woman.

Rachel nodded reluctantly. She could not bear to think of her little girl having been all this time in the workhouse. It had been her deepest trouble in the jail; and now she only answered the stranger's question with a silent nod. The woman spoke more coldly when she spoke again.

"I'm thinking you'd best be on the road again," she said, after a pause; "my old man may come in any minute now, and it angers him to catch strangers about the place."

"Oh! I'll go, and thank you kindly," answered Rachel, rising wearily from the warm corner of the fire-place. The woman followed her down the garden-path, and locked the little wicket after her. Rachel's heart sank for a few minutes; but every step was bringing her nearer to Aston, and before the cottage was lost to sight she had forgotten everything but that she should soon see Rosy.

CHAPTER III.—NEW YEAR'S EVE.

It was growing dusk before Rachel reached the end of her day's journey; for when she inquired in Aston for the workhouse, she found that it was nearly a mile farther on. It was only a branch from a neighbouring union, and was built on purpose for the reception of pauper children. There was no casual ward in it. Tramps who applied there for a night's shelter were bidden to march on another four miles to the larger workhouse, to which this one belonged.

At last Rachel stood beside a door in a high wall, which was pointed out to her as the entrance to the place; but she hesitated now, and trembled to ring the bell. All day long she had been alone, except for the little while when she had been resting in the cottage by the way; but the hour had come when she must not only face her fellow-creatures, but must let them know who she was and where she came from. Her long, solitary imprisonment—for the greater part of her life in jail had been solitary—had made her shy of seeing new faces and of speaking to strange people. Yet there was no escape

for her. If she was to see Rosy and claim her, she must say that she was her mother, and must produce proof of it. More than once during the day she had unfolded the chaplain's letter and spelt out the words in it, and now in the dim light she looked at it once more to give her courage. "Thou, God, seest me!" she said, as, with a shaking hand, she pulled the handle of the bell, and heard it clanging loudly somewhere out of sight.

The door was flung open quickly enough by a boy in the workhouse dress. Rachel could see over his head into a large square court, white with frozen snow, where a crowd of girls and little boys were playing together, or cowering under the shelter of a wall, shivering with the cold. Her eyes ran eagerly about the groups; but she could see no child like her Rosy. Suppose she should be ill, or perhaps dead!

This last dread struck her dumb. Dead! She had never thought of that. There were so many sicknesses which kill young children, and her child had had no mother to watch her and nurse her through them. Yes. Very probably Rosy had died in some illness, with no one to care for her, with only a pauper nurse to be hard and cruel to her, and not one to drop a single tear upon her lifeless little face. She fancied she could see her, nailed down in the rough coffin provided for pauper children, and carried off carelessly to be buried away out of sight, like something not worth thinking of.

"Come, now then, what is it you're after?" asked the boy, holding the door fast in his hand, as though to prevent her going in.

"I want to see the master," she said, in a choking voice.

"Can't," he answered, "it's New Year's Eve, and it's our treat to night. They're smartening up the school as fine as five-pence, for there's lots of grand folks coming. That's why we're all turned out, though it's so precious cold. But there'll be cake for tea, and oranges after."

"But I must see the master," urged Rachel, "there's a little girl of mine here, or ought to be, and I've walked ten miles or more from Thornbury. I must speak to the master for one minute—only one minute."

"No good trying," he answered, "he'd say nothin' save box my ears; only they've got some ladies helpin' to do the room, and he'd be afeard of showin' his teeth afore them. I'd go for a penny."

"Do you know if there's a little girl called Rosy Trevor here?" she asked tremu-

lously; "a very pretty little girl. I can't see her anywhere about."

"Oh, I don't know the little girls' names," he said, "and it's against rules to let them speak to anybody, without the master, or somebody, being by. They're afeard of 'em tellin' tales out of school, I reckon."

"Is this a bad place for little girls?" she asked in great anxiety.

"Oh, no; not so bad," he answered, "they give us enough to eat, and they don't thrash us for nothink. They never do thrash the little girls, you know; only box their ears soundly, like their mothers 'ud do at home. And we've treats twice a-year. It's our winter treat to-day. If you'll give me a penny, I'll go to the master; and what are I to tell him, suppose he'll hearken to me?"

"Tell him Rachel Trevor has walked all the way from Thornbury," she said, "to see her little girl Rosy, and take her out of the house. I'm dead tired and worn out, and I don't know wherever I can go for the night, if he won't take me in here."

"They never takes folks in here," answered the boy, shutting the door in her face, and bolting it inside. She leaned against the door-post, waiting and listening for his return. Deeper and deeper fell the shadows of the night; and the air grew keener and sharper with the frost. It was quite dark before she heard the children trooping into the house, in answer to a bell that tinkled and jangled sharply. The little ones must be almost frozen to death, she thought, as she stretched her own benumbed limbs. But what was she to do? She could not stay outside the door all night; yet she could not go away unsatisfied. She must know, at least, if her Rosy was still alive.

Her ring was answered by a woman this time, who listened patiently, and bade her follow her to the kitchen. There was a great stir and bustle going on. Fires were blazing, and huge cans of sweetened tea were being carried across the playground into the school-room beyond, with piled-up baskets of cake following them. The sudden heat, and light, and noise smote upon Rachel painfully. She sank down on the floor, with a strange, shrill, passionate cry, and rocked herself to and fro, as if to keep down the wild fears and frenzy, which threatened to be too strong for her. The women crowded round her, but her sobs hindered her from speaking to them for a minute or two.

"Is my little girl here?" she cried, at length, "oh! I'm feared she's dead; dead

"THE STORM OF LIFE."

and buried! Ask somebody if Rosy Trevor's here!"

"Give her a drop of tea to drink, poor thing," said one of the women, "why! she's all but froze! There, dear, you drink a drop, and I'll run to the master, and ask him for Rosy Trevor; that's her name, is it? I'm a'most a stranger here, or I'd tell you at wunst, poor, lost dear!"

Rachel felt dazed and light-headed; everything swam giddily before her eyes. She drank a cup of tea thirstily, but she could not swallow any food. It seemed an age before the master came in, though he had sent word by the woman that he would speak to her for a minute. At last he came into the kitchen hurriedly.

"Now then, where's the woman?" he asked, "oh! there you are! what's your business with me?"

"Please, sir," cried Rachel, falteringly, "is my little girl, Rosy Trevor, dead?"

"Dead! no," he answered, "Trevor's all right; what do you want with her?"

"I'm her mother, and I've come to take her away," she said.

"So! you are Rachel Trevor!" he exclaimed, speaking in slower tones, and looking more closely at her, "and you've just served your time out in Thornbury jail for the housebreaking at the Hall."

"Yes, sir," said Rachel, with downcast head. She had caught a quick movement among the women in the kitchen, and knew they had all turned to stare at her.

"Your husband's in jail still," said the master, in a half whisper, but in the sudden and deep silence that prevailed, his words could be heard distinctly. "I don't know that you've any right to claim your child. I daren't let you have her on my own responsibility. I must apply to the guardians, and you must come again, say in a week's time."

"Oh, sir!" cried Rachel, "only let me see her to-night!"

He hesitated for a minute; but there did not seem to be any risk in letting her merely see the child, in the presence of so many witnesses. Shrill voices singing a hymn rang across the play-ground, giving notice that tea was over. He hurried away, promising to send the girl, on condition that her mother would take herself off quietly, as soon as she had seen and spoken to her. Rachel forgot all about her, as she gazed out into the darkness, through the open door by which Rosy was to come in. She saw the school-room door open and close again; and heard a child's step coming slowly, very slowly and

lingeringly, across the yard. She tried to speak, to call "Rosy!" but her voice failed her. Why could she not call Rosy, as she used to do, when the little curly head and laughing face were hiding away from her, in the old times?

But it was not Rosy, who crept in timidly out of the darkness! It was no merry laughing little darling. This thin, long-armed girl of seven, with short clipped hair, and dull, pale face! Where was her little love, full of fun and frolic, and pretty as the roses, after which she was named? This frightened-looking child had her face half hidden by an ugly green shade over her eyes, and she crept about carefully, like one nearly blind. It could not be Rosy; they were trying to put off some other woman's girl upon her. Rachel trembled with disappointment, mingled with a vague dread.

"Who are you?" she asked, sharply.

"Trevor," answered the child, in a sulky voice, "the master said my mother was in the kitchen, and I must come to her."

"No, no; not Rosy, not my little Rosy!" cried Rachel, with a strange yearning to catch the poor, half-blind child in her arms; yet fighting against the thought that she had found her lost darling in a creature so unsightly and so sad. The little girl stood apart from her, peeping at her from under the green shade.

"Yes, I'm Rosy Trevor," she said, "is it true you're my mother; quite true?"

"If you're Rosy," she sobbed, falling on her knees before the child, "I'm your mother. Don't you know me? If you're my Rosy, come close to me, and kiss me."

"No," she answered, pushing away Rachel's hands, "if you're my mother, teacher says you're a wicked, wicked woman; and I want to go back to the treat."

She freed herself from Rachel's grasp, and ran away more quickly than she had come in, as if she were afraid of being kept against her will. But Rachel neither followed her, nor called her back. A blow had struck her to the very heart. Rosy had not died as she had feared, uncared for, and unwept; but she had lost her merry, pretty little darling; lost her more even, than if she could have gone to her little grave, and mourned bitterly over it. Rosy had been taught to hate her, to shrink from her as a wicked woman! She hardly dared to lift up her head, and face the glances of the women, who had seen and heard all that had passed; who had listened to her own child calling her wicked. It was true enough; she was

willing to own that humbly ; but it was very hard to hear it from the lips of her own little girl.

"I promised the master I'd go as soon as I'd seen Rosy," she said, rising up from her knees, and turning to the door without looking round. The woman who had spoken kindly to her before, followed her, and thrust a large piece of cake into her hand.

"There, poor creature !" she said, softly, "maybe you're a wicked woman ; but you've got a mother's heart, and God knows how

you was tempted. Eat that, as you go along, my dear."

CHAPTER IV.—TROUBLED WATERS.

WITH heart bowed down, and with slow and weary footsteps, Rachel passed out into the snowy lane. It had been dark for an hour or more, and the sky overhead was black and starless ; still, the glimmer of the snow gave her light enough to see her way. She did not dare to ask the favour of a shelter in the workhouse for the night ; and four miles

Page 5.

of lonely road lay before her, before she could find a resting-place. Yet, if her heart had been light, she could have walked along the frost-bound lanes bravely, buoyed up by the thought of soon having her child as her own again. But now her broken and saddened spirit made every step she trode a weariness and pain to her.

By the time she had crept a mile or so upon her way, a waggon overtook her, going towards the town. The waggoner wished her a good New Year as he came up to her, and with a sorrowful voice she asked him if he could not give her a lift in his waggon.

"Thee'rt sick, I reckon," he said, as the low, pained tones struck even upon his dull ear.

"Ay ! sick at heart," said Rachel, "I'd as lief lie down i' the snow, and die, as go on to yonder town. There's no good New Year for me ; never, no more."

"That's bad," he answered, "but there's no long lane without ne'er a turning. Patience ! Thee'll come to a turning by-and-by, I'll be bound. There ! Get thee up in the waggon, and lie thee down on the straw. We'll be more than an hour yet ; the snow clogs us so."

Rachel fell into a feverish sleep before many minutes had passed, and saw and felt no more till the waggoner called her at the first lamp-post in the town, to ask where she meant to go. She awoke shivering and wondering where she could be. Not in her little cell, which had been her home so long. She almost wished herself back in it.

"Can you tell me to a lodging?" she asked, after she had climbed down from the waggon, and stood desolately in the light of the lamp.

"Well," he said gruffly, "I'm slow of thinking, but I've thought may be you're the woman they told me of in Aston; a house-breaking woman, fresh out of Thornbury jail. If I'd thought, I'd have left thee to tramp thy tramp by thyself. If thee'rt an honest woman, I know a place for thee; but if thee'rt nought else save a jail-bird, there's places for such as thee, though I know nought about them. So tell the truth; which woman art thee?"

It was a hard question for Rachel. It seemed easy enough to declare herself an honest woman, and deceive the simple and kindly countryman. She was ready to tell the lie; the words were upon her lips, when the recollection of her friend's letter, which she carried for safety in the bosom of her gown, came sharply across her mind. If God saw her, how could she speak that falsehood?

"I'm that poor, bad woman," she said, almost in a whisper.

"Then thee must go thy own road," answered the waggoner, "and I must go mine. My wife's an honest woman, thank God!"

Rachel watched the wagon lumbering heavily down the street. A gleam of comfort came to her as she thought that God would be pleased, and maybe the chaplain would know what she had done; but it soon passed away in the difficulty of finding a lodging. There seemed to be no room for her in any decent place; and at last she was forced to pass the night in a low lodging-house, where a rough and riotous crew were keeping New Year's Eve. She cried herself to sleep as the bells were ringing the old year out and the new year in. Not the worst day in the jail had been so full of pain and misery as this first day of her freedom.

To claim Rosy, and to get away from this neighbourhood, where her crime was known, was the first thing to do. But where was she to go? and how was she to earn an honest living for them both? Honest she must be; that she was bent upon. No fresh crime

of her's should part her again from her child. Even Rosy's hard words to her strengthened her in her resolution. She should never be taunted again with having a wicked woman for her mother. Rosy should see how good, and industrious, and honest she would be. Before her marriage, so long as she kept herself steady and trustworthy, she had been a most valuable servant; and she was longing to prove herself steady and trustworthy again. If only she might meet with somebody who would give her a chance!

The first week of the New Year was not ended, when Rachel received her little girl from the master of the workhouse, who cautioned her to take good care to keep off the parish for the future. Rosy had been crying bitterly, and was sobbing still, when Rachel took her by the hand and walked with her down the village street. The women and children in the cottages looked out after her, with loudly spoken remarks; for the robbery at the hall had been the favourite subject of talk ever since it had been committed. Rosy hung back, and dragged heavily on her hand, hindering her from passing swiftly, as she would have done, out of sight. It was a cruel, bitter grief to her. Rachel's face grew white and miserable as she dragged Rosy's reluctant feet along towards the deserted lanes. Could it be true that God saw it all; these sneering, mocking women, who were shouting after her, and this reluctant crying child who would escape from her if she could? He knew how she wanted to be good. If He loved her, if only He saw her in her trouble, would He not help her?

She felt calmer when at last they reached the lanes, where there was no one to stare at them and revile her. She sat down on a stone by the wayside, and took Rosy on her lap. It was the first time she had held her in her arms, pressing her closer and closer to her breast, since she was a little, laughing baby, hardly old enough to call her mother. How often in prison she had dreamed of nursing her and fondling her, and wept bitter tears when she awoke to find it only a dream! Rosy shrank from her at first; but the kisses that were pressed upon her lips and cheeks were so different from the harsh and cruel treatment she had been dreading, that after a minute or two she resisted no longer. By-and-by even she returned her mother's kisses, whilst a faint smile stole over her dull face.

"Are you a very wicked woman?" she asked doubtfully. "They told me you'd beat me, and take away my new clothes."

which, both in its physical aspect and its geological structure, differs considerably from the hilly district that lies between Peel Fell and the high-grounds that roll down to the wide plains watered by the Glen and the Till. The highest point in the range is that which gives its name to the hills—namely, the Cheviot—a massive broad-topped hill, which reaches an elevation of two thousand seven hundred and sixty-seven feet above the sea, and from which a wonderful panorama can be scanned on a clear day. The top of the hill is coated with peat, fifteen to twenty feet thick, in some places. A number of deep ravines trench its slopes, the most noted of which are Hen Hole and the Bizzle. Peel Fell, at the other extremity of the range, is only one thousand nine hundred and sixty-four feet high, while the dominant points between Peel Fell and the Cheviot are still lower—ranging from one thousand five hundred feet to one thousand eight hundred feet. The general character of the hills is that of smooth rounded masses, with long flowing outlines. There are no peaks, nor serrated ridges, such as are occasionally met with in the northern Highlands; and the valleys as a rule show no precipitous crags and rocky precipices, the most conspicuous exceptions being the deep clefts mentioned as occurring in the Cheviot. The hills fall away with a long gentle slope into England, while on the Scottish side the descent is somewhat abrupt; so that upon the whole the northern or Scottish portion of the Cheviots has more of the picturesque to commend it than the corresponding districts in England. Indeed, the opposite slopes of the range show some rather striking contrasts. The long, flat-topped elevations on the English side that sweep south and south-west from Carter Fell and Harden Edge, and which are drained by the Tyne, the Rede Water, and the Coquet, are covered for the most part with peat. Sometimes, however, when the slope is too great to admit of its growth, the peat gives place to rough, scanty grass and scrubby heath, which barely suffice to hide the underlying barren sandstone rocks. One coming from the Scottish side is hardly prepared, indeed, for the dreary aspect of this region as viewed from the dominant ridge of the Cheviots. If in their physical aspect the English slopes of these hills are for the most part less attractive than the Scottish, it is true also that they offer less variety of interest to the geologist. Those who have journeyed in stage-coaching times from

England into Scotland by Carter Fell, will remember the relief they felt when, having surmounted the hill above Whitelee, and escaped from the dreary barrens of the English border, they suddenly caught a sight of the green slopes of the Scottish hills, and the well-wooded vales of the Edgerston Burn and the Jed Water. On a clear day the view from this point is a very charming one. Away to the west stretch in seemingly endless undulations the swelling hills that circle round the upper reaches of Teviotdale. To east and north-east the eye glances along the bright-green Cheviots of the Scottish border, and marks how they plunge, for the most part somewhat suddenly, into the low grounds, save here and there, where they sink in gentler slopes, or throw out a few scattered outposts—abrupt verdant hills that somehow look as if they had broken away from the main mass of the range. From the same stand-point one traces the valleys of the Rule and the Jed—sweetest of border streams—stretching north into the well-clothed vale of the Teviot. Indeed, nearly the whole of that highly-cultivated and often richly-wooded country that extends from the base of the Cheviots to the foot of the Lammermuirs, lies stretched before one. Here and there abrupt isolated hills rise up amid the undulating low grounds, to hide the country behind them. Of these the most picturesque are dark Ruberslaw, overlooking the Rule Water; Minto Crags and Penielheugh, with its ugly excrescence of a monument, both on the north side of the Teviot; and the Eildon Hills, which, as all the world knows, are near Melrose.

After he has sated himself with the rare beauty of this landscape (and still finer panoramic views are to be had from the top of Blackhall Hill, Hownam Law, the Cheviot, as also from various points on the line of the Roman Road and other paths across the hills into England), the observer will hardly fail to be struck by the great variety of outlines exhibited. Some of the hills, especially those to the west and north-west, are grouped in heavy masses, and present for the most part a soft, rounded contour, the hills being broad atop and flowing into each other with long, smooth slopes. Other elevations, such as those to the east and north-east of Carter Fell, while showing similar long gentle slopes, yet are somewhat more irregular in form and broken in outline, the hills having frequently a lumpy contour. Very noteworthy objects in the landscape also are the little isolated hills of the low grounds, such as Ruberslaw,

and the Dunian above Jedburgh. They rise, as I have said, quite suddenly out of that low gently undulating country that sinks softly into the vales of the Teviot and the Tweed. This variety arises from the geological structure of the district. The hills vary in outline partly because they are made up of different kinds of rocks, and partly owing to the mode in which these rocks have been arranged. But notwithstanding all this variety of outline, one may notice a certain sameness too. Flowing outlines are more or less conspicuous all over the landscape. Many of the hills, especially as we descend into Teviotdale, seem to have been smoothed or rounded off, as it were, so as to present their steepest faces as a rule towards the south-west. And if we take the compass-bearing of the hill-ridges of the same district, we shall find that these generally trend from south-west to north-east. So much, then, at present for the surface configuration of the Cheviot region. When we come to treat of the various rock masses, and to describe the superficial accumulations underneath which these are often concealed, we shall be in a better position to give an intelligible account of the peculiar form of the ground, and the causes to which that configuration must be ascribed.

The solid rocks which enter into the composition of the Cheviots consist mainly, (1) of hard grey and blue rocks, called *greywacké* by geologists, with which are associated blue and grey shale; (2) of various old igneous rocks; and (3) of sandstone, red and white, interbedded with which occur occasional dark shales. Now, before we can make any endeavour towards reconstructing in outline the physical geography of the Cheviot Hills, during past ages, it is necessary that we first discover the order in which the rock masses just referred to have been amassed. I shall first describe, therefore, some sections where the members of the different series are found in juxta-position, for the purpose of pointing out which is the lowest-lying, and consequently the oldest, and which occupy the uppermost and intermediate positions.

The first section to which reference may be made is that exposed in the course of the River Jed, at Allars Mill, a little above Jedburgh. This section is famous in its way as having been described and figured by Dr. Hutton, who may be said to have founded the present system of physical geology. In the bed of the stream are seen certain confused ridges of a greyish blue rock running right across the river course, that is, in a direction a little north of east and south of

west. These ridges are the exposed edges of beds of greywacké and shale, which are here standing on end. The beds are somewhat irregular, being inclined from the vertical, now in one direction and now in another, or, as a geologist would say, the "dip" changes rapidly, sometimes being up the valley and sometimes down. The same beds continue up the steep bank of the river for a yard or two, and are then capped by another set of rocks altogether, namely, by soft red sandy beds which at the bottom become *conglomeratic*, that is to say, they are charged with water-worn stones. The annexed diagram, Fig. 1, will show the general appearances

Fig. 1. Conglomerate and red sandstone, &c., resting on greywacké and shale, g.

presented: g represents the vertical greywacké and shale, and c the overlying deposits of conglomerate and red sandy beds. Now let us see what this section means. What, in the first place, is greywacké? The term itself has really no meaning, being a name given by the miners in the Harz mountains to the unproductive rocks associated with the vein-stones which they work. When we break the rock we may observe that it is a granular mixture of small particles of quartz, to which sometimes felspar and other minerals are added. The grains are bound together in a hardened matrix of argillaceous or clayey matter, blue, or grey, or green, or brown and yellow, as the case may be. At Allars Mill, and generally throughout the Cheviot district, the prevailing colour is a pale greyish blue or blueish grey; but shades of green and brown often occur. The component particles of the rock are all rounded or waterworn. Again, we notice that the ridges and bands of rock that traverse the course of the Jed at Allars Mill are merely the outcrops of successive *strata* or beds. It is clear then that greywacké and the grey shales that accompany it are *aqueous* rocks, that is to say, they consist of hardened sediment, which has undoubtedly been deposited in successive layers of variable thickness by water in motion. But since the sediments of rivers and currents

are laid down in approximately horizontal planes, it is evident that if the greywacké and shale be sedimentary deposits they have suffered considerable disturbance since the time of their formation; for, as we have seen, the beds, instead of being horizontal or only gently inclined, actually approach the vertical. The fact is that the outcrops which we see are only the truncated portions of what were once rapid undulations or folds of the strata, the tops of the folds or arches having been cut away by geological agencies, to which I shall refer by-and-by. What existed at one time as horizontal strata have been crumpled up into great folds, the folds being squeezed tightly together, and their upper portions planed away before the overlying red sandy beds were laid down. The accompanying diagram, Fig. 2, may serve to make all this clearer. Let A A

Fig. 2.

represent the present surface of the ground, and B B a depth of say fifty feet or a hundred feet from the surface. The straight continuous lines between A and B represent the greywacké beds as we now see them in section; the dotted lines above A A indicate the former extension of the strata, and the dotted lines below B B their continuation below that datum line. Thus it will be obvious that in a succession of vertical or highly inclined beds, we may have the same strata repeated many times, the same beds coming again and again to the surface. Thus the stratum at *s* is evidently the same bed as that at *x*, *y*, and *z*.

Such great foldings or redoublings of strata are most probably originated during subsidence of a portion of the earth's crust. While the ground is slowly sinking down, the strata underneath are perforce compelled to occupy less space laterally, and this they can only do by yielding amongst themselves. All folding or contortion on the large scale,

that, namely, which has affected areas of strata extending over whole countries, seems to have taken place under great pressure, in other words, to have been produced at considerable depths from the earth's surface. We can conceive, therefore, of a wide tract of land sinking down for hundreds of feet, and producing at the surface comparatively little change. But a depression of a few hundred feet at the surface implies a considerably greater depression at a depth of several thousand feet from the surface, and it is at great depths, therefore, that the most violent folding must take place. Consequently considerable contortion, and much folding, and lateral crushing and reduplication of strata may occur, and yet no trace of this be observable at the surface, save only a gentle depression. For example, in Greenland, a movement of subsidence has been going on for many years,—the land has been slowly sinking down. The rocks at the surface are of course quite undisturbed by this widely-extended movement, but the strata at great depths will no doubt be undergoing much compression and contortion. It follows from such considerations, that if we now get highly contorted strata covering wide areas at the surface, we may be sure that very considerable *denudation* has taken place. That is to say, large masses of rock have been removed by the geological agents of change, so as to expose the once deeply buried tops of the arched or curved and folded strata. We may therefore infer from a study of the phenomena in the Jed at Allars Mill; first, that the red sandy beds are younger than the greywacké and shale, seeing that they rest upon them; and, second, that a very long period of time must have elapsed between the deposition of the older and the accumulation of the younger set of strata; for it is obvious that considerable time was required for the consolidation and folding of the greywacké, and an incalculable lapse of ages was also necessary to allow of the gradual wearing away by rain, frost, and running water of the great thickness of rocks underneath which the greywacké was crumpled. And all this took place before the horizontally-bedded red sandstone and conglomerate gathered over the upturned ends of the underlying strata. The succession of rocks at Allars Mills is seen in many other places in the Cheviot district, but enough has been said to prove that of the two sets of strata the greywacké beds are the older.

There is another class of rocks, the relative

position of which we must now ascertain, for no one shall wander much or far among the Cheviots without becoming aware of the existence of other kinds of rock than greywacké and sandstone. Many of the hills east of the Oxnam and the Jed Waters, for example, are composed of igneous masses, that is to say, of rocks which have had a volcanic origin. As we shall afterwards see, the whole north-eastern section of the Cheviots is built up of such rocks. At present, however, we are only concerned with the relation which these bear to the greywacké and the red sandy beds. Now at various localities, for example, in Edgerston Burn, on the hill face south of Plenderleith, and again along the steep front of Hindhope and Blackhall hills, which are on the crest of the Cheviots, we find that

Fig. 3. Igneous rocks (*i* & *a*) resting on greywacké and shale, *g*.

the igneous rocks rest upon the greywacké and shale (see fig. 3) precisely in the same way as do the red sandy beds. They there-

fore belong to a later date than the greywacké. In other places, again, we meet with the conglomerates and red sandstones resting upon and wrapping round the igneous rocks (see fig. 4), so that it becomes quite obvious

Fig. 4. Conglomerate and red sandy beds, *c*, resting on igneous rocks, *i*.

that the latter occupy an intermediate position between the greywacké and shale on the one hand, and the conglomerate and red sandstone upon the other.

We have now cleared the way so far, preparatory to an attempt to trace the geological history of the Cheviots. The three sets of rocks, whose mutual relations we have been studying, are those of which the district is chiefly composed; but, as we shall see in the sequel, there are others, not certainly of much extent, but nevertheless having an interesting story to tell us. Nor shall we omit to notice the superficial accumulations of clay, gravel, sand, silt, alluvium, and peat; monuments as they are of certain great changes, climatic and physical, which have supervened during the ages that have passed away.

SHEPHERD'S SONG.

FOLLOW, follow, little sheep,
O'er the dreary wold;
Follow, soon ye all shall sleep,
Safe from wet and cold.

Linger not, oh! lagging feet!
Night will soon be here;
Weary shepherd fain would greet
Wife and children dear.

In his cot the fire burns bright,
Supper's ready laid;
Baby waits to say good night,
Ere he goes to bed.

Little ones run in and out,
Watch beside the gate;
"What can father be about,
That he's home so late?"

Mother makes the ashes blaze,
Baby smiles to see;
Tells them how some wanderer strays
From the flock and me.

Whilst the children warmly sleep,
On the dreary wold,
Father stays till all his sheep
Are safely in the fold.

Linger not, oh ! lagging feet !
Darksome night is near ;
Weary shepherd fain would greet
Wife and children dear.

M. BETHAM-EDWARDS.

THE MEN OF BETH-SHEMESH.

BY THE LATE BISHOP THIRLWALL, D.D.

"And the men of Beth-shemesh said: Who is able to stand before this holy Lord God? and to whom shall he go up from us?"—1 SAM. VI. 20.

WHAT a striking contrast have we here, between these words of the men of Beth-shemesh and that which is related of their conduct only a few verses before! When the ark, after a captivity of seven months, was restored by the Philistines, it was at Beth-shemesh that, under supernatural guidance, it first crossed the border of Israel. The men of Beth-shemesh were reaping their wheat-harvest; and when they lifted up their eyes, they beheld the ark, as many of them had seen it seven months before, when it was taken away from the tabernacle at Shiloh to the camp of Israel, drawn by the milch-kine into the valley. The sight filled them with transports of joy. The labours of the field were suspended for the pleasanter and more important work of welcoming the arrival of the ark with due honours. The Levites—for Beth-shemesh was one of the Levitical towns—took it down from the carriage in which it had been placed, and when they had set it on a great stone, a kind of natural altar, "the men of Beth-shemesh offered burnt-offerings and sacrificed sacrifices the same day unto the Lord."

When we remember what the ark was to every faithful Israelite, we cannot be surprised that its return from captivity should have been hailed with such tokens of joy and gratitude. We may in some degree conceive how its loss was felt, how deep was the grief with which it pressed on every bosom, if we consider that which is related of the manner in which the tidings of the national calamity were received at Shiloh. Eli, the chief priest and governor of the land, could bear to hear that "Israel was fled before the Philistines, and that there had been a great slaughter among the people." Eli—the too affectionate father—could bear to hear that both his sons had fallen in the battle. But when the messenger added that the ark of God was taken, he could bear no more: he fell to the ground, as if struck with a thunderbolt. It was for the ark his heart had been trembling all along; and when his worst forebodings were fulfilled, he could live no longer. And his daughter-in-law sank under the same blow. The joy of motherhood might have consoled her for the loss of her father-in-law and her husband. But when she heard that the ark

of God was taken, she became deaf to every word of comfort; "she answered not, neither did she regard it." Her dying pang was not that of orphanhood or widowhood. It was the Ichabod, which was perpetuated in the name of her child. It was the thought that "the glory is departed from Israel; for the ark of God is taken." So, in every one's estimation, the ark was the glory of Israel. Was this a vulgar error, a groundless fancy, a popular superstition? Not so. The more we consider what the ark was in itself, the more clearly shall we see that this estimate of its value and dignity was neither false nor at all exaggerated. The ark was indeed the glory of Israel in many points of view.

1. It was the centre of the national religion, the visible sign by which the worship of Israel was distinguished from that of the surrounding idolatrous nations. A stranger, if he had been permitted to enter the sacred precincts, might have passed through the outer court, and even into the holy place, without being sure that he was not in some heathen temple. But when he came to the holy of holies, and saw the ark, in the place which, in a heathen shrine, would have been occupied by some image of the god to whom the building was dedicated, whether a human form or some bestial and monstrous idol—like the Dagon of the Philistines, half-man, half-fish—he could no longer doubt that he was in the tabernacle of the God of Israel.

2. And if he inquired into the meaning of that which he saw, he would learn that the contents of the ark were infinitely more precious than the gold with which it was overlaid. For it contained the tables, deposited in it by divine command, from which it was called, sometimes the ark of the covenant, sometimes the ark of the testimony, inasmuch as the Ten Commandments were the fundamental law in which God testified of himself by the revelation of his will, and the terms of the covenant into which He entered with his people.

3. The stranger would also have observed a covering of pure gold on the top of the ark, and he would have been told that this was the throne of the Divine Majesty, where it was the Lord's good pleasure to be found, to receive atonement for the national breaches

of the covenant, and to commune with his servants, who were admitted to his immediate presence, of the things which concerned the common weal.

So the ark was at once a memorial of God's mercies in times past, and a pledge of his continued favour in time to come. It was a centre and a bond of national unity, which, even in the absence of any supreme earthly authority, knit the hearts of the people together by the closer alliance of a common faith and hope, and a more dutiful allegiance to a Heavenly King.

Yes, the ark was indeed the glory of Israel, its most precious treasure, its surest safeguard, the crown of all its blessings. Yes, it was with good reason that the men of Beth-shemesh beheld it with joy, and received it as a most welcome and honoured guest. Yet a very short time seems to have elapsed before their mind was entirely changed. Their language now is, "Who is able to stand before this holy Lord God?" Their most ardent desire is to see the ark moved to some other place.

How had this come to pass? What had happened in the meanwhile? It was that they had made a discovery as to the character of Him with whom they had to do. They had learnt that, as Hannah declares in her song, "The Lord is a God of knowledge, and that by Him actions are weighed;" and also that he is a God of judgment, and that by Him misdeeds are punished. Not as if they had not known this, in a general way, long before. But the conviction had recently been brought home to their minds by painful experience, and had flashed upon them with all the force of a newly-revealed truth. There is much obscurity as to the precise nature of the offence which had been committed, and of the penalty with which it had been visited. But all that concerns us at present is the effect produced upon their minds. They had suffered a calamity in which they recognised a divine punishment of their transgression. Their conscience witnessed to them that it had been deserved. They felt, as for the first time, that they were in the presence of a holy Lord God. The presence thus manifested overwhelmed them with awe. It was more than they could endure. "Who," they cry, "is able to stand before this holy Lord God?"

Surely that was the expression of a very right as well as natural feeling. It was the feeling of the Psalmist, when he exclaimed, "Enter not into judgment with thy servant,

O Lord, for in thy sight shall no man living be justified." It was the feeling of the last of the prophets, when he asked, "Who may abide the day of his coming, and who shall stand when He appeareth?" But that which strikes us as strange, is the practical conclusion to which the men of Beth-shemesh were led. As soon as they have been impressed with a sense of God's tremendous holiness, their first thought is how they may rid themselves of a presence which had become insupportable: "To whom shall He go up from us?"

No doubt, throughout this history, the sacred record exhibits a faithful picture of an age of rude, childlike simplicity, which is nowhere more apparent than in this part of the narrative. Israel was at this time halting between two opinions, and while it retained the worship of Jehovah, was still hankering after the grossest superstitions of the heathen, and bowing the knee to Baal and Ashtaroath. It was in the same spirit in which the men of Beth-shemesh desired that the ark might go up from them, in order that they might be delivered from the terrors of the divine holiness, that the elders of Israel, in the day of their distress, had said, "Let us fetch the ark out of Shiloh, that when it cometh among us it may save us out of the hand of our enemies." Astonishing blindness, we are ready to exclaim, as we look back from the noon-day light of our Christian knowledge, to those days of ignorance and error. What! was the Lord less mighty to save at Aphek, though the ark had remained at Shiloh? or was He less able to punish the sins of Beth-shemesh after it had been transferred to Kiriath-Jeharim? And yet is it so certain that, with all our better light, our religious privileges, our higher intellectual cultivation, we never fall into practical errors as gross as those which move our wonder and our pity, when we read of those who lived thousands of years ago in that infancy of the world? Are we altogether free from a like confusion and vacillation in our view of the divine character, or from a like inconsistency in our own conduct, as subjects of the divine government?

1. The men of Beth-shemesh fluctuated between two apparently opposite and irreconcilable aspects of the divine nature, and passed rapidly from the one to the other. Do we not often allow ourselves to be perplexed in like manner by the seeming difficulty of reconciling God's holiness with his love? and are we not ready to justify our uncertainty and indecision by the authority

of Scripture? For if we read that God is love, we also read that He is a consuming fire. If we are taught to think of Him and address Him as our Father, we, nevertheless, hear Him proclaiming a threat of "indignation and wrath, tribulation and anguish, against every soul of man that doeth evil." And though his wrath may be more or less fully revealed before its appointed "day," still, revealed or not, it does not the less exist, nor, if it does exist, can it be regarded otherwise than as the constant frame, so to speak, of the divine mind toward evil-doers. But then how can they at the same time be the objects of a fatherly love? And yet that they are so we have the fullest assurance in the declaration, that "God so loved the world, even while it was lying in wickedness, that He gave his Son, that the world through Him might be saved." The worst is that many, while they keep wavering between these two views, transfer that contradiction, which really exists only in their own thoughts, to the divine character, and picture God to themselves after the image of their own infirmity, as a capricious and arbitrary Lord, whose government proceeds on no fixed principles, but is swayed in the distribution of good and evil by motives like those which commonly prevail in human bosoms, of partiality or resentment. If we were not blinded to the truth by our personal interests, we should see that in the Godhead there can be no such thing as self-contradiction or inconsistency, no such thing as change or variableness of turning. What God is now He has ever been, and will ever be. What He does now He has ever been and ever will be doing, though to us it appears as a process of development and of continual progress. Whenever He is spoken of in Scripture in terms borrowed from the language of human frailty and passion, we may be sure that it is in condescension to the imperfection of our faculties. God would not be God if He was not good. And if He is good, it follows that He is purely and supremely good, as, if He is light, there can be in Him no darkness at all. His will is uniformly, unchangeably, inflexibly set on that which is good. It cannot for a moment waver, or be found tending to any other end. This persistency is God's righteousness, which is immovable and everlasting. But such a constant tendency to good implies a no less constant opposition and antagonism to evil; that is, to every will which is not conformable to his own. And this, expressed in the language of human affections, is what is

meant by God's hatred of evil, or his wrath against evil-doers. And so it appears that his hatred is indeed one with his love, and only another side or aspect of his perfect goodness, which would not be goodness if it could behold iniquity with complacency or indulgence.

2. But the fault of the people of Beth-shemesh lay not in any speculative error, nor in the want of clear and well-connected ideas; it was that they were guilty of practical inconsistency, and were not faithful to the light that was in them. They received the ark with every sign of joy; they put aside for the time all their ordinary occupations, the work of the field and the household, to do it honour, and to make the day of its arrival a solemn feast-day. What, then, was the ground of this joy? No doubt they believed that in the ark they were receiving a pledge of numberless blessings, of victory abroad, of peace and plenty at home. And we shall probably be doing them no wrong, if we suppose that they regarded its presence as an honour to themselves. It distinguished their township above all the cities of Israel. Beth-shemesh appeared to have taken the place of Shiloh. But still, they were well aware that it was not the ark itself, the work of men's hands, that was the source of these blessings, and that, indeed, it was only worthy of honour, because, through a special divine appointment, it testified to the invisible presence of a living God. And the witness which it bore to his presence was at the same time a witness to that which was most essential in his character, and most prominent in all the declarations He had made concerning himself; that is, his holiness. In this word was summed up all that He was in himself, and all that He claimed from his people: "Ye shall be holy; for I the Lord your God am holy." That was all the meaning and all the value of the ark. That was why it was called the ark of the testimony and of the covenant. That was why it contained the tables of the law. That was why it was covered with a mercy-seat. Wherever it was, there could be no excuse for any Israelite's forgetting that it betokened a special presence of a holy Lord God. And yet, when the festival was over, when the men of Beth-shemesh had returned to their ordinary pursuits, this thought seems almost immediately to have vanished from their minds. The ark, to which they had been paying such devout homage, became to them as if it had been no more than a common empty chest.

It ceased to remind them of the dread presence to which it silently witnessed. There was need of a great calamity, of an alarming visitation, to bring the truth home to them. And when it broke upon them they were as men waking from a pleasant dream to a terrible reality.

But are we, my brethren, more faithful to our better light? Do we live more nearly up to our higher privileges? Or, on the contrary, does not the example of Beth-shemesh reflect the likeness of a far grosser and more lamentable inconsistency in our own conduct? I need not tell you that as often as we come together in the house of God we there find all that the presence of the ark could give, and infinitely more. There we behold and grasp the substance, of which it could only present the shadow. The tables, which were its richest treasure, were but figures of that better covenant in which God would put his laws in the mind of his people, and write them in their hearts. And the mercy-seat did but signify that perfect and final reconciliation wherewith He would be "merciful to their unrighteousness, and would remember their sins and their iniquities no more." In the worship of the Christian sanctuary we have access with boldness to that presence which dwelt of old in the thick darkness, and are permitted to make that pure offering, which, presented by our Great High Priest, is more acceptable to the Lord than thousands of rams and ten thousands of rivers of oil. The time which we set apart for this worship should be to all of us a season of gladness, an occasion of purer and higher joy than the arrival of the ark could afford to the inhabitants of Beth-shemesh; and it is with good reason that, as often as it returns, we exhort one another "heartily to rejoice in the strength of our salvation." So far we are following their good example. But how is it with us when the season is past, and we have resumed our ordinary occupations? Is there, then, much difference between us and them? Do the services of our sanctuary appear to leave a deeper trace in our hearts and minds? Or is there less of variance than there was in their case, between the language of our solemn meetings and the common practice of our daily life? Does it not seem as if we thought that, as soon as we have left church, we had passed out of the divine presence? I do not mean that this is apparent in our looks and gestures, or that the outward demeanour which is suited to the sanctity of the place and the occasion ought to be retained every-

where else. That would be the affectation of a "sad countenance," which our Lord so severely condemns and forbids. But how many even try to retain any wholesome impression which may have been made upon them in the house of prayer? How much fewer are those who let it shape their conduct in the affairs of life—when a question arises as to some new course of action, some new connection or engagement, when they have to choose between seeking or shunning a dangerous temptation, between seizing or neglecting an opportunity of dutiful self-sacrifice? These are the things which test the sincerity and earnestness with which you have taken part in public worship. If your profiting does not appear in these things, you will have reaped little benefit, you will have incurred the risk of great loss and hurt.

And so it must be with those who come not of their free will, but from some worldly motive, as to comply with custom, to save appearances, but grudge the time which they spend in God's house, and are saying in their hearts, "When will the Sabbath be gone?" So it must be with those who really delight in the Sabbath, but only as a welcome repose after a week of toil, enabling them to return with new vigour and zest to the pursuits which engross all their interest. So it must be with those who regard their attendance simply as a duty, which demands the sacrifice of a certain portion of their time, and is accomplished as soon as this has been spent, and who are unconscious of any ulterior object. How many with a right, but not fully enlightened feeling, would shrink from making the holy season a day of toil, who do not scruple to waste it as a day of rest? How few endeavour to turn it to account as a day of progress in their spiritual life, which may and ought to be bringing them constantly nearer to God!

Here, my brethren, is a very serious thought, with which I will conclude. Unless we are moving in this direction toward the centre of our true rest, and our everlasting home, since we cannot remain stationary, we can have no prospect before us, but that of an ever-growing distance and an endless alienation from the source of all real peace and joy. If we attempt to disguise this from ourselves, we are acting in the spirit of those who said, "Who is able to stand before this holy Lord God? and to whom shall He go up from us?" As if, by banishing Him from our thoughts, we could escape from his presence, or place ourselves beyond the reach of his arm. Rather let us learn to fly, not *from*,

but to that holiness which is perfect love, as the one strong hold to which we may always resort; the one stay which will surely bear us up, when all others give way from under us; the haven where we would be, and

which, though seen but afar off, gives us strength and courage to ride upon "the waves of this troublesome world," and keeps our souls calm and steadfast, in the perfect peace of a holy comfort.

ST. MICHEL.

I.

AT night, on the barren strand of Moidrey. —I hear the dry autumn wind—dry and yet charged with salt, it comes singing over the stunted rushes and coarse herbage of the low sea marsh. One after another the lights of Ardevon are extinguished in the primitive farmhouses along the heavy road that leads to "La Grève"—that waste of sands which appear and disappear daily for leagues along the Norman coast.

The moon is high, but hidden by a long aerial rampart of clouds. By the dim light of stars I push on alone toward the sea. No other human soul is travelling thither. Is it clay, or is it sand beneath my feet? Surely the road has changed? I cannot see for the darkness, but the ground is moist and yielding to the tread. Yea, I have reached the sands. I hear no longer the wind in the rushes—another strange sound is in my ears. Is it the murmur of some distant forest, or the steady plunging of a waterfall? I peer into the darkness, I can distinguish nothing—only the smell of the salt wind comes across the "Grève." The clouds part slowly—a rift of pale light—a flash upon the horizon—wide white splendour upon sea and sand. What rises before me—black, immense, solitary? The sky shows pale against it; in another moment the light seems to creep round. It smites upon the walls and towers of a huge citadel, with ranged ramparts and granite slopes and pinnacles thrown into the air. This black mass rising on the summit of a huge rock from the midst of what I now perceive to be a waste of sand and sea, has suddenly lost its terror; as I gaze it assumes a more dim and shadowy form, a mist is rising from the dark recesses, whilst here and there a granite surface with castellated turrets and machicoulis shines out against the deeper shadow of the rock. With eager eyes fixed upon this strange apparition I walk steadily on, heedless of the flooded sands, expecting to see the castle of white mists and moonlight shadow vanish into the darkness out of which it has so suddenly emerged.

But the rushing sound of the rising tide recalls me to my senses. I am ankle deep in the sea. In another moment the moon passes behind the black clouds. The wondrous castle has vanished. The very stars seem to have gone out. I turn my face towards Moidrey, and hasten to regain its barren strand.

II.

The heat smote up from the rock. I leaned over the parapet of Beuregard—four hundred feet above the sea. The faint smell of the white and red laurel was wafted by the grateful breeze from the little gardens that lay skilfully disposed beneath me on the rugged and irregular platforms of the island. The vines were budding, and the pear and apple blossoms glowed within many an ancient granite enclosure, flecking the rock with their snowy and crimson petals. The bright vigorous green of spring lay cool upon the grey hot stone. I watched the gold and copper-coloured lizards dart in and out of the crumbled masonry. Here and there great butterflies rose like winged flowers beneath me, and floated away over the steaming sands.

The tide had turned. The sands were at their driest. The venerable rock of the Tombelaine, forlorn relic of the mainland, lay between us and the coast line bathed in mirage.

The gatherers of shellfish, scattered like black specks over the Grève, were assembling for the homeward march in little groups with their heavily-laden baskets on their backs, and hundreds of white seagulls left their feasting by the shallow tide-stream as they heard the distant roar of the water coming in.

To the north and west lay three square leagues of sand, and a fair mile between us and the mainland; yet, with the exception of a thin stream that never fails, for ever winding between sea and sea, all was dry and firm to the tread.

As I looked down upon this flat and barren wilderness, I asked myself what feat of engineering, what years of toil, what human contrivance or skill, would suffice to flood this wide grey space? And whilst I mused,

steadily advancing along the thin stream came a flat head of water—crawling and spreading as it flowed.

I looked towards the sea, and saw that the distant sands were already submerged. Still between us and the shore the road was open, and the stream was thin and shallow.

As I turned I saw another huge flat-headed watery serpent crawl from afar upon the crisp dry sand to meet its fellow from the ocean. I then noticed that the long canal-like river that debouched at Moidrey was swelling, and a full tide had begun to set down it from the sea.

No sooner had I marked this than the galloping of distant hoofs fell upon my ear. A carriage and pair had started from the mainland—the driver was shouting and urging his steeds—for between tides the Grève can be easily crossed.

Then followed under my eyes one of those hazardous adventures which ere now have ended fatally. The horses galloped hard for the ford, and the two watery serpents came on pouring their deluge of sea around them, deeper and deeper and wider grew the stream, and faster galloped the horses.

They arrive breathless on the brink and pause—but for pausing there is no time; to retreat might even now be dangerous—lashing his horses and shouting wildly, the driver dashes into the stream; the poor animals struggle bravely up to their bellies, and for a moment the carriage itself seems to sway and float, but in another instant the good steeds feel the firmer ground beneath their hoofs, they are safely over the ford, and trot gaily up to the gate of St. Michel.

And even as I look the daily miracle has taken place. The leagues of hard dry sand are now nothing but a waste of waters, and boats cross freely over from the rock to the river and the strand of Moidrey.

III.

And what is St. Michel? A sanctuary from time immemorial. Its rocky summit rising into the air—first crowned with Druidical remains, later with a Roman temple, and lastly with a Christian church—has been in turn the shrine of the legend, the romance, and the religion of at least twenty centuries.

Though not always isolated, it was always sacred. The remains of the vast forest of Quoquelunde, as late as the sixth century, still stretched from the mainland to the rocky mount. In the seventh century the remnants of it disappeared before the inroads of the rapid tide, but a wooded slope

on the north-east side of the island still recalls the ancient homes of the Druids; and the earth, in many parts, is riddled through and through with countless warrens, made by the lineal descendants, no doubt, of the old forest rabbits of the mainland.

As we look up at the wondrous pile from the sands, and note the mighty walls and towers behind which nestles, for protection, the little town, the eye measures those ancient granite masses, as solid and colossal as the rock on which they stand, and is fairly bewildered at the abrupt elevation, one above the other, of castle and monastery, until, on the summit of the whole, a vast cathedral, wonderful to behold even in its decadence, leaps into the air with flying buttress, pinnacle, and spire.

And who built it, and how was it built? We know where the granite came from; but how were the immense blocks floated over from the neighbouring Rochers de Cancales hardly visible in the remote distance? How were they got across that shallow, treacherous tide, or how, when the sea went out, were they prevented from sinking into the sands? These are light matters, as the student of St. Michel's Mount will soon learn. Was not the great Archangel watching over the destinies of his shrine? A string of miracles, a group of shining legends, light up the pages of its eventful history.

As we read far back in the past, the colours seem all fresh, like the gold and azure of the ancient missals on the yellow parchment of the monastery itself.

The good Bishop St. Paterne, of Avranches (sixth century), sent through the forest of Quoquelunde his band of pious workmen, who cleared part of the rock, and founded two churches to SS. Symphorien and Stephen, and a monastery.

St. Scubilion was the first abbot, but the Christian legend begins only after the washing away of the forest in the seventh century. Then it was that St. Michael twice visited St. Aubert (A.D. 708), bishop of Avranches, and pointed to the isolated rock as his chosen sanctuary. The holy man, mistrusting such visions, opened his Bible and meditated on St. John's words, "Beloved, believe not every spirit, but try the spirits." Again he fell asleep, and this time St. Michael pushed him roughly with one finger on the side of his head (*pulsatur austerius*), upbraiding him with his sluggish incredulity; and the bishop arose to found a church endowed with his own lands, and destined to become one of the most famous pilgrimages in Christendom.

IV.

From this time forward the sound of the great Archangel's wings, his shining apparition, and the echoes of his mysterious voice, constantly hallow the destinies of his favourite temple. On the lonely summit of the rock, the awe-struck monks pealed out the bells in the midnight storm; the black cloud of evil spirits was thus quickly dissipated: and, as the howling of the wind died away, the stars shone out through the flying silver films, on which St. Michael and all his Angels swept by.

But the guardian of high places extended his care to the travellers on the sands, and a huge cross, which has now disappeared, marked, for many years, the spot where a poor woman with her infant had been protected miraculously from the rising tide.

About many of the legends there is a great tenderness of feeling, strongly marking the Angel's love of little children, who on that pitiful rock, in that poor and squalid town at the foot of the monastery, must have often had a hard and precarious time of it. It was through a little child that the great Druidical stones were rolled down from the top of the mountain; and in the frequent conflagrations which took place amongst the crowded wooden huts, St. Michael had been known to protect children in their cradles beneath the ruins.

But the awe which the heavenly patron inspired is well marked by the singular regulation which forbade any porter or watchman to remain all night in the church, since there, at times in the vigil hours, the angelic choirs descended, and the trembling monk had often heard them singing. A poor priest of the monastery, consumed with a rash though reverent curiosity, hid himself one night in an angle of the basilica, when lo! the angel Michael, self-illuminated with awful radiance, and accompanied by the Virgin Mary and the blessed Peter, are seen walking in the angelic temple. The monk falls almost lifeless upon the pavement, muttering a wild prayer. Michael scans him severely, but the Virgin intercedes, and, advancing towards him, utters these words:—

"Colibert! why seek to behold heavenly mysteries? Rise; go forth and expiate, as best thou canst, the affront offered to angelic spirits."

The poor monk tottered out of the church in great agony of mind, but on the third day he was a corpse. "*Tertia diē vitam finivit*," says the severe old chronicler.

V.

In the twelfth and thirteenth centuries the fame of St. Michel's Mount had spread all over Christendom, and as a place of pilgrimage it ranked second only to the Holy Sepulchre at Jerusalem. So great, about this time, was the exportation of its stones as relics that the mountain itself might have disappeared by this time had the practice gone on. Shells of the bay, of which there is an unfailing supply, happily were substituted; and every pilgrim, as he left, carried his string of shells away. The shell appears on the ancient escutcheons of St. Michel; and pilgrims far inland, who had never seen the sea, eagerly adopted the famous symbol. Hence such allusions as in the well-known lines of Walter Raleigh:—

"Give me my *scallop shell* of quiet," &c.

So great was the honour paid by the Popes to the abbots of St. Michel, that one of these (Geoffroy de Servon, 1298) was even permitted to exercise high episcopal functions. Another (John Gonault, 1444) was made the Pope's Vicar-General in things spiritual and temporal. Robert de Torigny (1154—86), or Robert of the Mount, called "the friend of popes and kings," and extolled in the verses of Stephen the Bishop of Rennes, was the most illustrious of them all. After the murder of Becket, it was in the presence of De Torigny that Henry II. did penance at Avranches; and the abbot was subsequently appointed governor of the castle of Pontorson. Next in honour comes Pierre le Roy (1386—1410). He was counsellor of Charles VI. of France, came to England as ambassador, and was received with great honour by our Richard II. in 1395. He was afterwards sent twice as ambassador to Pope Benedict XIII., and afterwards to Pope Gregory XII.; and the dignity of "*Referendaire*" was conferred upon him by Pope Alexander V.

From the earliest times, kings and princes visited the mount as pilgrims. Childbert III. in 710, Charlemagne in 800, brought splendid gifts. Edward the Confessor and St. Louis came more than once. Here our Henry I. was besieged by William Rufus. Here Henry II. kept his court in 1166, and received the homage of the Bretons; and here Louis XI., in 1469, founded the order of knighthood of St. Michel.

But its sacred nature has not protected the Mount from some of the bloodiest wars on record, nor has St. Michel ever shrunk

from vindicating its position, age after age, as one of the most impregnable fortresses in the world.

Endowed by kings, bishops, and nobles, it has, out of its wealth, paid for armies and fitted out fleets; and as early as 1060 its abbot sent a powerful contingent of ships to William Duke of Normandy for his expedition of 1066.

As we tread its sands, or watch from its embattled heights the treacherous sea coming in from the north and the south, we can well imagine the exulting glee with which the defenders of the sanctuary must have watched

the discomfiture of the English in 1434. They had advanced across the Grève on the 17th of June, with twenty thousand (?) men, and with battering rams and many ponderous engines of war. They succeeded in making a breach, but their position then became more untenable than ever. The little garrison under Louis d'Estouteville numbered but one hundred and nineteen, all refugees of noble or gentle blood, and from their terrible vantage ground they assailed the besiegers along the line of perpendicular steeps and hurled them back into the swift returning tide.

The enemy set fire to their war engines and

Mont St. Michel before restoration.

baggage, and two thousand of them, struggling with their heavy arms, knee-deep in the swift current, sank into the quicksands, or were swept away by the sea. No wonder that the little garrison, as they beheld this fearful sight from the walls, and found that not one of their own men was killed or wounded, attributed their victory to the special love and protection of St. Michael. Two long cannons taken from our Henry VI. in 1427, still lie one on each side of the gateway of St. Michel—one of them is still loaded with an immense stone ball, nearly a foot in diameter.

After the defeat under D'Estouteville, above recorded, the English came to the conclusion that the place was impregnable.

From the neighbouring rock of the Tombelaine, fortified by them, or even from the site of their own fortifications on the mainland at Ardevon, the proud fortress could now be knocked to pieces in a few hours by our modern guns. May that day never come!—may no English or Prussian gun, no communist infernal machine, be ever levelled against the fair monument of antiquity now rising so steadily into new life and splendour, but a splendour which we fear Michael and all

his Angels would not interpose to save from the profane rifled cannon of the nineteenth century.

VI.

But the chief glory of the Mount must ever be that in ignorant and brutal ages it was the home of piety and letters. The Benedictines early established there a strict rule. In the chapter-house, now known as the Salle des Chevaliers, the place is still shown where the simple brothers made open confession of their faults, and received public admonition and fatherly direction from the good abbot, and the little pulpit still stands in the refectory, from whence some pious exhortation was read aloud during meals.

The famous "Injunctions" and counsels of perfection by the great abbot, Peter le Roy, are still preserved in the library at Avranches. But the Mount before its days of ruin was especially rich in MSS. There might be found St. Augustine's "Homilies on St. Paul"—ninth century MS.; some of Cicero, and some of Aristotle, translated by St. Augustine; works of Gregory the Great; a splendid lectionary, still extant, of the Mont St. Michel, all of the tenth century. Here, too, were the lives of the saints, the Golden Legend, the works of Seneca, so much coveted, and sought for in vain, by Roger Bacon. Robert de Torigny himself wrote a hundred books; the best known of his writings is a history of Henry I., now the eighth book

Plan of Restoration of Mont St. Michel, South Face.

of Guillaume de Jumièges, the continuation of Sigebert's Chronicles, and numerous expositions by himself and others of St. Paul's Epistles. So vast a number of MSS. did he collect, that the Mount was called the city of books, from the great library of De Torigny in the north tower, now no longer standing.

The cloisters at the top of the Mount were the favourite resort of scholars and learned pilgrims. Here, under the direction of the Benedictines, and later under the fraternity of St. Maur, regular schools were held, and courses of instruction delivered; whilst in the neighbouring cells the quiet recluses pored over their MSS., and multiplied copies of the most rare classical and sacred writings.

In these days of rapid printing, and almost equally rapid scribbling, it is not easy to enter

into the feeling of the patient monk as hour after hour, and day after day, with little sense of the lapse of time, he bent lovingly over his exquisite caligraphy, or fashioned with a kind of artistic inspiration those lovely and delicate borders of crimson, ultramarine, and burnished gold which make at once the wonder and despair of modern illuminators. Yet in the heart of the recluse there was often a longing for the sympathy of the outer world, a conscious reaching forward to generations yet unborn, a sweet sense that his handiwork would be blessed by future students, a desire that at such a moment his own modest name might not be wholly forgotten; nay, as I handle the stained parchment, the spirit of the old monk seems peeping over my shoulder, nodding a mute

approval when I read his lines of self-recommendation at the close of a transcript of St. Augustine :—

"Friend, whilst you read remember the scribe, and should you care to know it, Cyraldus is the name of the humble brother whose pen has transcribed this work."

The ideal of obedience, prayer, and study may not always have been reached by the inmates of St. Michel, but history bears

witness to their exceptional merits, whilst the strange functions to which they were sometimes called is quaintly summed up in the following terse rhyme written by one of them :—

"Miles in clauastro,
Monachus in prælio,
Azura in cælo."

"A soldier in the camp,
A monk in battle!
Glory in heaven!"

NATURAL HISTORY OF ATHEISM.

I.

"I had rather believe all the fables in the Legend and the Talmud, and the Alcoran, than that this universal Frame is without a MIND."—LORD BACON.

I REMEMBER well, when I was passing from boyhood into youth, some fifty years ago, shortly after the battle of Waterloo, there was a general conviction in the public mind—at least in that large section of the public which is more mightily stirred by the present than taught by the past—that after so many years' wild turmoil of guns and bayonets there was now an end for ever of that culmination of sanguinary horror called War; and I remember no less distinctly how when, a few years afterwards, by the advice of a stout old doctor of divinity in Marischal College, Aberdeen, I waded my way through that most interesting of all ancient theological treatises, "Cicero de Naturâ Deorum," and finished the perusal with the abiding belief that that culmination of all speculative absurdities called Atheism was a thing of the past, and could no more reappear on the stage of credible things than those old women suspected of holding communion with the Evil One, who, not more than two hundred years ago, used to be flung into the milldam, that, if they were not witches they might sink, and if they were witches they might float and be burnt. But I have lived long enough now to understand that both these anticipations were premature. As for war, I have long since made up my mind that it is not only a theatre of horrors, but a school of virtue; and that in a rich and various world, crowded with antagonistic tendencies and contrary interests, hostile collisions of various kinds must take place; and the only thing to be done with war, by sensible men, is not to dream it out of the world, but while we are never eager for it, to be always ready, and, when we are in the heat of the strife, to fight like men, and not like tigers. As for Atheism,

again, I have learnt equally, by the consideration of certain recent phases of thought, taken along with the general history of human speculation, that it is a disease of the speculative faculty which must be expected to reappear from time to time, when men are shaken out of the firm forms of their old beliefs, and have not yet had time to work themselves into the well-defined mould of a new one. It indicates, in fact, a chaotic state of mind analogous to that physical chaos which makes its epiphany betwixt the destruction of an old world and the creation of a new.

What is Atheism? As a theory, with regard to the nature and constitution of the universe, the word means either that the mighty something, the *τὸ πᾶν*, the *all*, was produced out of nothing, nobody knows how, and goes on producing itself into something, nobody knows how; or that it has existed for ever, and will exist for ever, as a mighty confused complex of something that acts, called *force*, and something that is acted on called *matter*; but it takes its shape from no intelligent or designing cause, merely from blind *chance*; or at least that it is a self-existent combination of forces and the results of forces, of which, in their unity, no intelligible account can be given.

Now the first observation that occurs to one on this view of the constitution of this wonderful structure of things called the world, is, that on the broad view of the ages and cycles of human speculation it is a strikingly exceptive, abnormal, and monstrous type of reasonable thought. It seems, on the first flush of the matter, to bear somewhat the same proportion to the general current of human thinking that dyspomania and other odd conditions of morbid sensi-

bility do to the normal state of the human nerves. Or, to take another simile: the general aspect of the fields and the forests and the face of the earth, except in the desert of Sahara, is green; but sometimes, wandering in the depths of the leafy dells, or through the luxuriant beds of artificial gardens, we stumble on a single plant whose leaves are red, while all its congeners are of the normal green. This peculiar hue, though it have a certain novel attraction about it, is in fact a disease, and will not be looked upon with favour by any gardener. Such exactly seems to be the case with Atheism. It is a doctrine so averse from the general sense of human sentiment, that the unsophisticated mass of mankind instinctively turn away from it, as the other foxes did from that vulpine brother who, having lost his bushy appendage in a trap, tried to convince the whole world of foxes that the bushy appendage in the posterior region was a deformity of which all high-minded members of the vulpine aristocracy should get rid as soon as possible. In common times and under normal circumstances, men are not disposed to accept Atheism, in any shape, as having any positive value. It is simply a defect in the reason, as much as the want of an eyeball in what looks like an eye, or the want of a beard in what looks like a man. Men without beards, or women with them, will justly not be taken account of in the general estimate of the sexes.

The fact is, as Socrates says in the "Memorabilia," man is naturally and differentially a religious animal, and is not thoroughly or normally himself unless when he is so. It has been so much the fashion lately to hunt out and to parade points of identity between man and the lower animals, that it may be a service to sound reason just to state the immense gap that exists betwixt the strange unfeathered biped called man and our first cousin the ape, if Dr. Darwin or Mr. Huxley will have it so. What monkey ever wrote an epic poem, or composed a tragedy or a comedy, or even a sonnet? What monkey professed his belief in any thirty-nine articles, or well-compacted Calvinistic confession, or gave in his adhesion to any Church, established or disestablished? Did any monkey ever smile or laugh (for a grin is not a laugh), or sing, or give the slightest indication of knowing even the most elementary propositions in the first six books of Euclid, such as are easily crammed into the heads of the dullest undergraduate of the term? Plainly not. And though men

in Egypt, for some symbolical reason that may not have been so foolish as we imagine, paid certain sacrosanct attentions and pious ministrations to crocodiles, there is no proof that even crocodiles or monkeys, or any other of the lower animals, ever worshipped anybody. Dogs worship men, you will say. Yes, but only in a fashion. Dogs have neither churches nor creeds; and as the god whom they worship is the man who visibly feeds them and tangibly flogs them, it is a very cheap sort of religion. Socrates was certainly right in this matter, rather than Darwin. He saw as great a gap betwixt man and the lower animals in the descending scale, as betwixt men and the gods in the ascending scale; and he recognised the peculiar differential excellence of the human species simply as this, that they could recognise the gods, and give evidence of the recognition by the reverential observances of what we call a religion. Surely this was a much more human, more normal, and more noble way of philosophizing than to take infinite pains, as some of our modern scientific men do, on the one hand, to restore our lost brotherhood with the baboon, and, on the other, to raise up an impassable wall of partition between all reasonable creatures and the Supreme Reason from whom all creatures flow. We miscalculate very much indeed if we imagine that the peculiar doctrines and favourite fancies of a few cultivators of physical science in this small corner of the world, and in this small half of a century, are likely to exercise any notable influence over the thoughts of men, after the one-sided impulse out of which they arose shall have spent its force. Not only all the unsophisticated masses of men, but all the great originators of philosophic schools and the founders of churches, have been theists. Moscs, David, and Solomon; Pythagoras and Anaxagoras; Socrates, Plato, Aristotle, and Zeno; St. Paul and St. Peter; Mahomet, St. Bernard, Thomas Aquinas, Dante, Kepler, Copernicus, Shakespeare, Luther, Spinoza, Bacon, Leibnitz, Newton, Locke, Des Cartes, Kant, Hegel. Against such an array of great witnesses of sound human reason, it is only the narrowness of local conceit, or the madness of partisanship, that could plant such names as David Hume (if David Hume did indeed believe in his own bepuzzlements), Jeremy Bentham, and John Stuart Mill. As for Confucius and Budd, the two great prophets of the far East, who certainly embraced a much wider sphere of human discipleship than any of

our English sophists of the negative school. they lie outside of our Western European culture altogether; but in so far as they seem to have taught a morality without religion, or a religion without God, we shall say a word or two about them by-and-by.

That the general consent of the most cultivated part of the human race, taken in the gross, is in favour of theism, and against atheism, seems, therefore, as a fact, plain enough. But whether there be certain races of human beings, up in the frosted North, or down in the fervid South, the tablets of whose inner nature, when nicely read, present absolutely no traces of a recognition of a superior world-controlling power, this is a question by no means easy in an exhaustive way to answer. One of the speakers in Cicero's book above-named, starts precisely this question—"Whence," says he, "do you—*i.e.*, the Stoics, who argue from the consent of the human race—prove the opinions of all nations? I verily believe that there are many peoples so lost in savagery that they have not even the slightest suspicion of the existence of gods."* Here are two contrary opinions: the one that there is a universal consent of all men and all peoples in the belief of a Supreme Being or Beings; the other, that there are nations so sunk in savagery, that they entertain not the remotest suspicion of God any more than their cattle, their sheep, or their swine; and to make these adverse notions more than opinions, to turn them into knowledge, as Plato is fond of saying, it is manifest that what we want is facts. Now the facts in this case are to be sought in remote and little travelled places, under circumstances not without danger, and, what is worse, often discouraging and disgusting to civilised men. Who is to go and live among wild men of the woods and roving Nomads of the waste for years, till he has thoroughly mastered their language, and by this process acquired the key to their notions and sentiments and convictions about whatever lies behind and above and within that wonderful evolution of beauty and grandeur and power, which we call the world? We naturally look to Christian missionaries here in the first place. They alone, with very few exceptions, seem to possess the earnestness of purpose, the single-hearted devotedness, and the intensity of moral apostleship, which could lead civilised men to make a moral experiment of this kind. But even their evidence in such a matter must be looked on with caution, and

sifted with care. An intense zeal—without which a missionary would be nothing—so far from implying an impartial judgment in all moral and religious matters, not seldom renders such a judgment impossible. We may say generally, indeed, that a zealous Christian missionary is not the man fully to appreciate the amount of genuine theistic piety that may lie hidden and half choked beneath the grotesque mummeries and disgusting practices that are all that certain low types of humanity have to show for religion. It is not at all uncommon, even among ourselves, to hear persons and parties branded as atheistical, only because the individuals who so stigmatize them have not been able, and, perhaps, are not in the least degree willing, to appreciate the sort of theism which they profess. If Spinoza has been called an atheist, though he did not deny God, but rather denied the world, and was, therefore, as Hegel says, more properly styled an *acosmist*; how much more may many savage tribes have been termed atheistical by ignorant and unthinking missionaries who failed to make the very obvious distinction between worshipping gods who are no gods, and worshipping no god at all? With this caution, therefore, let us hear what the most intelligent of the missionaries have to say; and in such a case there are few men who have a better right to be called into court than the noble apostle of South Africa, Dr. Moffat. Here is a well-known passage about the African Bushmen:—"Hard is the Bushman's lot—friendless, forsaken, an outcast from the world; greatly preferring the company of the beasts of prey to that of civilised man. His gorah* soothes some solitary hours, although its sounds are often responded to by the lion's roar or the hyena's howl. He knows no God, knows nothing of eternity, yet dreads death, and has no shrine at which to leave his care and sorrows. We can scarcely conceive of human beings descending lower in the scale of ignorance and vice, while yet there can be no question that they are children of one common parent with ourselves."† And to the same effect is the distinct testimony of Dr. Monat in reference to the Andaman islanders:—"They have no conception of a Supreme Being. They have never risen from the effects they see around

* "The gorah is an instrument something like the bow of a violin—rather more curved—along which is stretched a catgut, to which is attached a small piece of quill. The player takes the quill in his mouth, and by strong inspirations and respirations produces a few soft notes in the vibrations of the catgut."

† "Missionary Labours and Scenes in South Africa," Thirtieth thousand, p. 15.

* De Naturâ Deorum, i. 23.

them, even to the most imperfect notion of a cause. They have never ascended in thought from the works to a Creator, or even to many Creators—that is to say, Polytheism.* And one of the most eminent investigators into the primitive condition of man has the following interesting passages:—“The opinion that religion is general and universal has been entertained by many high authorities. Yet it is opposed to the evidence of numerous trustworthy observers. Sailors, traders, and philosophers, Roman Catholic priests and Protestant missionaries, in ancient and in modern times, in every part of the globe, have concurred in stating that there are races of men altogether devoid of religion. The case is the stronger because in several instances the fact has greatly surprised him who records it, and has been entirely in opposition to all his preconceived views. On the other hand, it must be confessed that in some cases travellers denied the existence of religion merely because the tenets were unlike ours. The question as to the general existence of religion among men is indeed to a great extent a matter of definition. If the mere sensation of fear, and the recognition that there are probably other beings more powerful than one's self, are sufficient alone to constitute a religion, then we must, I think, admit that religion is general to the human race. But when a child dreads the darkness, or shrinks from a lightless room, we never regard that as an evidence of religion. Moreover, if this definition be adopted, we cannot longer regard religion as peculiar to man. We must admit that the feeling of a dog or a horse towards its master is of the same character; and the baying of a dog to the moon is as much an act of worship as some ceremonies which have been so described by travellers.”†

But strong as these testimonies appear, it is extremely doubtful how far they would satisfy an impartial jury impanelled to try the point we are now discussing. Certainly if anthropological questions of this kind are to be decided on the same strictness of detailed testimony that pecuniary cases are decided in our law courts, the three testimonies here given, notwithstanding the weight justly attributable to the words of the writers, would require to be submitted to the most sifting cross-examination before they could be accepted as elements in the formation of any

conclusive verdict on the subject. And accordingly we find that another writer of equal authority, after quoting various testimonies in favour of the existence of atheistic races, nevertheless declares his opinion that no evidence sufficiently detailed and searching has been brought forward, such as might enable a cautious thinker to assert with confidence that there exists anywhere a race of human beings absolutely without religion of any kind.* And our great African explorer, Livingstone, talking of some of the most degraded tribes of the Africans with whom he came into connection, says, “There is no necessity for beginning to tell the most degraded of these people (the Bechuanas) of the existence of a God, or of the future state, the facts being universally admitted. Everything that cannot be accounted for by common causes is ascribed to the Deity—as creation, sudden death, &c. ‘How curiously God made these things!’ is a common expression, as is ‘He was not killed by disease, he was killed by God.’ And while speaking of the departed—though there is nought in the physical appearance of the dead to justify the expression—they say, ‘He has gone to the gods,’ the phrase being identical with *abii ad patres*.”†

This testimony is sufficiently strong, but of course it is strong only within the range of personal observation which it includes, and does not necessarily contradict the assertion of Moffat; for Livingstone, in the very next page, honestly states that “he had not had any intercourse with either Caffre or Bushmen in their own tongue.” On the whole, therefore, so far as our very imperfect evidence goes, we seem justified in concluding that, while some sort of religion seems to belong to man as man, one type of religion may differ from another as far as lust differs from love, opinion from knowledge, or caricature from art.‡ And if there be races of reasonable beings who have no idea of a cause, it is just the same thing as if we were to find in every Alpine valley whole races of Cretins, or anywhere in the world whole races of idiots; they are defective creatures such as no naturalist would receive into his normal description of one of Nature's types; such as roses, for instance, without fragrance, horses without hoofs, and birds without wings. Any type of things, indeed, as well

* Tylor, “Primitive Culture,” vol. i. p. 379.

† “Livingstone's Missionary Travels,” chap. viii. p. 158.

‡ An extremely interesting account of a very low type of religion, among the Ostjaks of Asiatic Russia, will be found in Alexander Castren's “Reise Erinnerungen,” Petersburg, 1853, p. 288, which we should gladly have inserted here had space permitted.

as man, may, by a combination of untoward influences, be curtailed and stunted into any sort of degradation.

So much for the facts. We return to our original assertion, and say, The great majority of human beings acknowledge God, and the practical form which this acknowledgment takes is called Religion. But this, no doubt, is a very wide and a very vague word, and requires exposition. In the main, however, its variations fall under two heads. Either it is a simple acknowledgment of an existing supreme authority in the universal order of things both physical and moral; or it contains further a philosophical theory with regard to the original creation and the continued preservation of the universe. Of these two types of popular faith the first is certainly the more important, affecting as it does directly the conduct of human life, and the position of personal subordination and responsibility, which all faith in a divine government implies; but the philosophical element is always included in the highest forms of religious belief. In this respect, indeed, religion is merely the popular form of metaphysics. Metaphysics and theology, in fact, in their ultimate issue are identical—metaphysics being formally only the more general term for the search into the ultimate ground of all Being, which search, in so far as it does not lose itself in a self-puzzling scepticism, issues necessarily in the assertion of the Eternal Reason, or *Λόγος*, which, in the well-known language of the Apostle John, in the opening words of his Gospel, is only another name for God.

It is a curious fact in the history of the human mind that the most subtle and speculative and scientific people of the ancient world—the Greeks—inherited a religion utterly destitute of this philosophical element, which is so prominent, not only in our Christian religion, but in Brahmanism and other superior forms of popular faith. There is not in the whole breadth of the Homeric poems—and Homer was virtually the Greek Bible—the slightest indication of that great philosophical proposition which stands written on the threshold of the Mosaic Scriptures, "In the beginning God created the heavens and the earth." The old Smyranean minstrel indicates, indeed, in a familiar line, that the gods of the Jovian dynasty had a father and a mother, whom he distinctly names Ocean and Tethys;* but this fragment of an early theologic speculation—for

it is nothing better—bears on the face of it that the existing gods, like the races of men, were born; and any religion in which such gods were supreme could not be said to contain a metaphysics; for every metaphysics must ask not only what is behind the show, but what is before the first. To say that old Ocean and his briny spouse were the father and mother of the gods was nothing more than going another step back in a celestial genealogy of which the origin was in the dark. When you have traced back a pensile chain a thousand links, you are no nearer to a philosophy than when you started, unless you tell us to what the first link is attached. The more current notion among the Greeks was, that the existing dynasty of gods of whom Jove was chief was preceded by two dynasties—the first that of Kronos, whom the Romans identified with Saturn, and the second that of Uranus and Gee, or Heaven and Earth. This implied, no doubt, a philosophical dualism, though in a different style from the dualism of the Good and Evil principle in the religion of the ancient Persians, but still a sort of philosophy. But whether we call this sort of theistic duality a philosophy or not, it is certain that the theory or the fancy was not a living, effective element in the Greek religion. It was a sort of infantile theology, which remained entirely outside of the popular faith and the national worship; not, as in the creed of all Christian Churches, where a dogmatic theology, or a positive theistic philosophy, constitutes the solid basis and the firm framework of the faith of the Church. Accordingly we find that when the Boeotian poet, Hesiod, who lived some fifty or a hundred years later than Homer, ventured in his capacity of theologer to trace the celestial genealogy a step or two further back, he fell plump into a mighty void, which showed how little there was of deep, thoughtful piety, and how much of superficial impression of the senses and shallow sport of fancy, in what the subtle Greeks had to content themselves with for a theology. Hear how the book of the celestial generations runs. Hexameters are apt to have rather an ungraceful hop in English, but we may try them here for a recreation:—

"In the beginning was Chaos: and afterwards came into
 being
 Earth broad-breasted, the stable upholder of starry Olympus;
 Darksome Tartarus too, within the bosom of broad Earth:
 Likewise Eros, the loveliest-born of all the Immortals,
 Thrilling the limbs of men and of gods with gentle emotion,
 Conquering counsel and wit in the charmed breast of the
 wisest.
 Eros, then, and black-stoled Night were children of Chaos;
 Night was mother of Ether, and Day was daughter of Dark-
 ness,

* "Ocean the father of gods immortal, and Tethys the mother."—II. xiv. 201.

Then when Erebus mingled with Night in fruitful embrace-
ment;
Earth then brought into being the night of the starry Welkin
Like to herself, to spread his vasty curtain around her."

We have nothing here manifestly but a succession of appearances, which no man who meant thinking could mistake for a philosophy of the universe. To call Night the mother of Day, if anything like causal connection is implied, is just as absurd as to say that emptiness is the mother of fulness. When I pour water into an empty tumbler, no doubt the tumbler was empty before it was full; in the order of my sensations the emptiness came before the fulness. That is all. In like manner, when I take my dinner, hunger goes before eating, and is in one sense the cause of my eating; but the cause of there being a dinner to eat is the culinary care of the cook. So, if I build a house, I may say, with Hesiod, In the beginning was the chaos of stones called a quarry, and from that chaos came the beautiful array of curiously co-ordinated stones which I call my house. But everybody sees that without the plan of the thoughtful architect and the hand of the skilful mason, the stones of the quarry could never heap themselves into a house. So it is with all order. To say that as a matter of individual experience in any particular case order proceeded out of disorder, explains nothing; it only states the case to be explained. How did the order come about? This simple question the theology of the Greeks seems never to have even started. Their religion consisted simply in the recognition of an established divine order of things under supreme authority, with reverential submission of the will thereto.

We have now to answer a very natural question: how far is this general consent of humanity a valid argument for theism? If an old sage had any reason for saying *οἱ πολλοὶ κακοί* (*the majority are bad*), might he not have equal or greater ground for asserting the majority are fools? Certainly a mere majority taken by itself would be a very poor argument for the truth of any proposition or for the rectitude of any course of conduct; otherwise all unlimited democracies would always be right, whereas experience has proved that they are peculiarly liable to go wrong. If the majority of persons in any village were given to drunkenness, this certainly would afford no argument in favour of the beauty of intoxication. And though men often decide very serious matters by mere majorities, is it not rather because they cannot do better than because they have any firm faith that the majorities will

be right? If suits on the issue of which many thousands of pounds depend are constantly decided by a majority of judges in the Scottish Court of Session, how often has the decision of that majority been reversed by the decision of a single judge in the English House of Lords? And naturally enough too; for one strong head will always be better than twenty weak heads; and turning the scores into hundreds would only multiply the confusion. And if, looking into the general administration of human affairs in any small town or large city, you should happen to have your eye fastened by any great improvement which has recently been made—such as, for example, the winning of land from the sea, and turning a useless, slimy beach into a beautiful, breezy, green esplanade, as has been done at Rothesay in Bute, or opening up a free prospect and a healthy ventilation—you will find that it was not the majority at all who did or desired these changes, but that some one man or large views and strong will had forced these changes, in spite of the indifference of the great majority and the violent hostility of a few. In what sense, then, shall we say that the consent of a majority supplies a test, or affords even a presumption of what is right? Plainly not in cases where any very extensive knowledge or subtle views are required; nor in cases where a man can claim no right to have an opinion at all, except after special study, and with professional training; as little in cases where the general judgment has been obscured, and cool discrimination been rendered impossible by the hot smoke and steaming mists of faction, ecclesiastical or civil. Nevertheless there is a preponderant rightness in the sentiment of the multitude, even in their judgments of important public matters, which every one feels in practice, and which even the cool Aristotle defends and illustrates at considerable length in his estimate of the value of democratic forms of government, as opposed to oligarchic. Perhaps we shall hit the mark here if we say broadly that as nature is always right, the general and normal sentiment of the majority must always be right, in so far as it is rooted in the universal and abiding instincts of humanity; and public opinion, as the opinion of the majority, will be right also in all matters which belong to the general conduct of life among all classes, and with respect to which the mind of the majority has been allowed a perfectly free, natural, and healthy exercise. And there will always be a presumption against practices, sentiments.

and opinions which run flat in the teeth of universal practice and the unvaried tradition of humanity. It affords a presumption against total abstinence, for instance, as a philosophy of life (for its utility as a special vigorous remedy against a special severe malady may well be admitted), that men of all classes in all ages have been fond of a glass of wine: in like manner it affords a presumption against the Quakers that men of all nations and in all centuries have fought great battles with their neighbours, and become great and strong by the fighting of great battles; and, again, it affords a strong presumption against the notion of dispensing with lawyers, clergymen, physicians, and all professional men—a favourite panacea with some—that in all ages and in all countries such types of the social man have grown up, and found grateful recognition from the majority. And though the majority of mankind are not philosophers, yet in all matters where nature rules them there is a wisdom in them that justly main-

tains its ground against the subtle speculations of abstract thinkers who excite attention by confounding things which are naturally distinct, and denying things which the constitution of our nature forces us imperiously to assert. If a glib creature, for instance, calling himself, or being called, a philosopher, should maintain that beauty depends on utility and fitness, you may safely let him spin as many chapters as he may choose in illustration of such a perverse paradox, when everybody knows that the ugliest possible bridge (which the railway companies frequently make) is as useful for its end, and as fit for its purpose, as the most ornamental structure ever devised. The systems of subtle thinkers, in fact, always require to be watched with particular caution: clever people are peculiarly apt to love the fancies of their own begetting, more than the facts of God's creation: though clever, they are not necessarily wise; and like Narcissus will be found sometimes glassing themselves complacently in their own real or imagined beauties.

J. S. BLACKIE.

TWO SONGS.

By THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

I.—THE BOAT OF MY LOVER.

GAELIC AIR—*F'hir a bhata*—"The Boat of my Lover."

O BOAT of my lover, go softly, go safely;
O boat of my lover, that bears him from me!
From the homes of the clachan, from the burn singing sweetly,
From the loch and the mountain, that he'll never more see.

O boat of my lover, go softly, go safely;
Thou bearest my soul with thee over the tide.
I said not a word, but my heart it was breaking,
For life is so short, and the ocean so wide.

O boat of my lover, go softly, go safely;
Though the dear voice is silent, the kind hand is gone:
But oh, love me, my lover! and I'll live till I find thee;
Till our parting is over, and our dark days are done.

II.—DEEP IN THE VALLEY.

WELSH AIR—"Waters of Elle."

DEEP in the valley, afar from every beholder,
In the May morning my true love came to me:
Silent we sate, her head upon my shoulder;
Fondly we dreamed of the days about to be:
Fondly we dreamed of the days so soon to be.

Deep in the valley, the rain falls colder and colder:
Safely she sleeps beneath the churchyard tree:
Yet still I feel her head upon my shoulder,
Yet still I dream of the days that could not be:
Yet still I weep o'er the days that will not be.

WHAT SHE CAME THROUGH.

ring.

Miss Cayley spoke sharply, for she was a little sharp by nature, and she was rendered sharper by her profession. She was a school-mistress—a little keen-eyed, intelligent-looking, not unlady-like woman, wizened and worn by half a lifetime's struggle, not to make her bread alone—though that is sometimes hard enough to make—but with the contrarieties of pupils and pupils' parents, teachers, governesses, and servants. Miss Cayley fought them all single-handed, and she bore the brunt of the battle by not a line of leanness, and not a few lines in her grey face. But she was not so worn as to remain mistress of herself and of a precarious situation.

Miss Cayley was in her drawing-room when she rang the bell. It was a pleasanter place than many such drawing-rooms. In the first place, Miss Cayley's school was situated in an old country-house, six miles from even the suburb of a large town. Second, Miss Cayley had a character of her own, and managed to impress it on her longings—on her favourite chair, her reading-table, her stand of plants, her

very knitting, and the magazine which she had been reading, and which lay open on the table before her. In the third, those essentials of a school drawing-room, which are almost as inevitable as the girl found practising on the best piano,—gifts and specimens of old pupils' work, crude performances in water colours and embroidery, mingled as they were here with old solid furniture and home comforts, only lent a certain air of youthful, hopeful aspiration to the room.

Miss Cayley was not alone, she had a guest who had till that morning been a stranger to her, and who had during their short acquaintance made anything save a favourable impression on Miss Cayley's mind.

Unlike Miss Cayley, this guest was a large handsome woman. She had impressively prominent and regular features, and a complexion which was still clear, red and white—contrasting in its clearness with the blackness of her hair, unsilvered by a single white thread. It had better be said at once that, though the lady's large person had so far outgrown the slenderness of youth, there was nothing in the unfading bloom and the unblanched locks, to suggest the idea of artificial substitutes to supply the thefts of time. On the contrary, this was a perfectly genuine woman, whose unimpaired vitality, if it needed any explanation, suggested only the German proverb that weeds do not wither.

The stranger was dressed well, in deep mourning. The depth of her crape and the dimness of her silk did not, however, prevent her having an obvious consciousness of the perfectly satisfactory style of her dress, and of the person on which the dress was fitted. There was an occasional glance at the fall of her skirt and the smoothness of her glove, with a droop of the long eyelashes, and a delicate modulation of the mouth—all probably tricks of habit, which, under the circumstances, were peculiarly exasperating to Miss Cayley. These were the only outward signs—and it required an observant eye to detect them—of under breeding, having its origin in more or less latent narrowness and meanness of nature.

There was a pause in the conversation after the mistress of the house sent the message with the servant. Miss Cayley leant back in her chair with a sense of weariness from

past fatigues and (brave woman as she was) from coming trials. She knit the already furrowed brow under her little lace cap, and looked as if she did not care to make an observation.

"Why should I speak and smooth away difficulties for a woman who I am sure is going to behave with abominable heartlessness, and who, when her brother is just dead, and when she has come to tell his death to his daughters, whom she has never seen, can sit and rejoice in her elegant clothes and make faces?" thought Miss Cayley to herself.

Very probably she did not make sufficient allowance for a formal woman of the world who was not her own mistress, and who, besides an enforced subjection, had one ruling passion, and only one, which steeled her sternly for this morning's work. Miss Cayley was still saying to herself, "I am not a sentimental woman. I know that the girls and governesses think me a flint and tyrant, but I cannot conceive how a woman, a mother, as this Mrs. Wyndham has told me she is, can meet those poor girls, for the first time, as she has shown me she means to meet them, with the news which she brings to-day. She is afraid of a scene! there will be no scene; the poor things will be too startled, scared, and shocked; and Anne has a good deal of sense and self-control for her years, while Pleasance will not take it in just at once; but they will remember this April morning to their dying day."

Miss Cayley moved restlessly, and looked for relief out of the window, to the lawn which she liked so much for the very things which would have been offences in many people's eyes—the unkempt lush grass under the great plane-trees, the daisies in the sunshine, the violets in the shade. But the lawn suggested no greater consolation to her than that such trials must be, even in the midst of God's sunshine; she could do nothing to prevent them; and she had troubles enough of her own at this time particularly.

All the while Mrs. Wyndham was nerving herself for the task which she had undertaken, by reflecting on what was to her its absolutely compulsory nature. "Wyndham would never consent to have it otherwise," she thought. "He has been disappointed as it is. I have suffered sufficiently from the consequences of poor Fred's folly; and I do not suffer alone;" and at this point of her reflections Mrs. Wyndham raised her head, and a flush of maternal pride, for the moment, kindled and softened the usual hard

coldness of even the rounded outlines and fresh tints of her handsome face. "There are my boys and girls. It would have made some difference to Tom at Oxford, and to Nelly and Rica in their coming out, if my brother had not wasted his portion, if he had lived quietly and economically, as we had the right to expect that a single man gone abroad to retrench and nurse his health would live. Instead, he has died the next thing to bankrupt, and for a legacy has left this undreamt-of affront and drag upon us;" and at the thought Mrs. Wyndham drew herself up and closed her mouth so that the natural curves of her lips were drawn tightly over her white teeth.

Though with ladylike reticence she held herself quite a different order of woman from the best and most capable schoolmistress, yet, like Miss Cayley, she was not beyond explaining herself, and appealing to the other's sense of what was right and fitting, soliciting as it were sympathy and co-operation.

"My brother could not have intended to acknowledge these girls," said Mrs. Wyndham, with determined conviction, "else why should he not have made known their existence to those of his nearest relations with whom he was on perfectly good terms?"

"I cannot tell why he should not," answered Miss Cayley with a considerable spice of abruptness and stubbornness in her politeness, "since he married their mother and gave them his name."

"Oh, my brother was like no one else in many things," said Mrs. Wyndham, quickly; "and although there was a marriage, else, of course, I should not move in the matter, I have no doubt he was wheedled into it, and certainly he was ashamed of the whole connection."

As this assertion seemed proved beyond doubt, Miss Cayley remained passive, for once in her life, and did not try to dispute it.

"My brother was at my father's place, living alone with him for some months before he died," continued Mrs. Wyndham, hammering on at her foregone conclusion. "He was my father's favourite child, to whom he would have forgiven any offence at last—do you think that any man in his senses, who owned children that he meant to bring forward, would not have seized the opportunity to confess his low marriage and the existence of children in order to ask for such a provision as my father had it in his power to make for them?" asked Mrs.

Wyndham, incredulously. "But no such appeal was made, and my father's will only left my brother his younger brother's portion, which he has since contrived to cast to the winds."

"All that I know," said Miss Cayley, feeling as if she were driven to the wall and compelled to speak, "is that the late Mr. Hatton, after writing and asking if I could take his daughters and keep them with me entirely because their mother was dead and he was going abroad, brought them to me six years ago, and left them with the instructions that they should have the best education which I had it in my power to give. I understand that he has never returned to this country, but has died abroad. However, I am happy to tell you"—and there was a suspicion of malice in the assurance—"that the girls' board has been regularly paid; and that he wrote to them and they to him, at the stated intervals which are usually observed between a father and children who have been long separated."

"I have no doubt of my brother's acting honourably," said Mrs. Wyndham with some hauteur. As she was not an irritable, but rather an obtuse woman, however, she returned to the charge. "As to the judiciousness of his arrangements, that is quite a different thing. I have already told you he was peculiar in his ideas, while he could not stand up for them before the world: witness this wretched business of a private and low marriage, with children that none of his friends ever heard of! He was one of your half-way offenders, who bear heavier punishments, and are often really greater trials to their families than the out-and-out sinners."

"I understand you," said Miss Cayley, stiffly.

"But, about these girls," said Mrs. Wyndham. "Could they be qualified to become governesses? They must earn their bread in some way, and the sooner they begin the better. My brother has left little or nothing to his account here. Money always did slip through his fingers, and he had tried speculation within the last year or two in America. A desperate resource for such a man in such a place. I don't think that there is more money than might fit out the girls and set them up respectably in their station in life; for, Miss Cayley, I hold distinctly that they are only raised by education a grade or two above what must have been their mother's station. It is said that the husband's rank becomes the wife's, and I do not quarrel with the assertion in a general way; but my

brother never acknowledged his wife openly, and there is no indication that she sought to be so acknowledged. As for his children, his conduct proved that he considered that it would be more consistent with their happiness to keep them in a comparatively humble sphere, and I shall do nothing to interfere with his intentions. The ignorance in which he kept me of his private relations, gives me no more claim upon the girls than it gives them a claim upon me."

Miss Cayley was by no means so satisfied of what the dead man's intentions might have been, but she contented herself with putting in the questions—

"May I ask if you are the nearest relation to my pupils? if they have other relations?"

"On the father's side I am the nearest and almost the sole relation," admitted Mrs. Wyndham, "of my father's family; the elder son and the younger daughter, neither of whom were on terms with my brother Frederic, though they were not aware of his worst scrape, died unmarried soon after my father—there were only poor Fred and I left." Any softening which might be implied in the statement passed away in a moment, as Mrs. Wyndham added, "And you know that I am a married woman and have a family of my own. In addition I may tell you frankly, that, although my father's landed and funded property thus unhappily all came to me, Mr. Wyndham's estate, which is in a hunting county, was burdened, my husband has expensive habits and tastes, our establishment is necessarily a liberal one, we have needed all and more than all the money we have inherited. Nothing shall tempt me to rob my own children of the advantages which are their due, in order to make an uncalled-for provision for my brother's unacknowledged children."

Miss Cayley was hot all over, but she kept silence, though she fulfilled the condition of the Psalmist, in so far as her heart's burning within her was concerned.

Yet Mrs. Wyndham had an amount of reason on her side. It would doubtless have been hard upon her, with her lawful pretensions, her despotical spendthrift husband, her doted-on children, suddenly to be called upon to dispense bounty to poor relations, low born on one side— orphan nieces—of whose very existence she had been unaware a month before. If she had only wielded her right to protest gently, and been merciful, not to say human, in the strait.

"I have no doubt that the girls could be governesses in time, as well as other girls,"

said Miss Cayley, after she had composed herself. "I think I may say that they have been well grounded. Anne retains all that she gets, and is thoughtful and steady. Pleasance is the cleverer, and promises to develop almost exceptional ability, but she requires to settle down, and grow up and out, before much can be said of her yet." And Miss Cayley smiled a little, and sighed a little. She was considering Anne's pride and delicacy, and Pleasance's thoughtlessness and fire when roused, with the difficulties of governess life, even although Miss Cayley advocated work for women, and anything was better than dependence here.

"When I spoke of the girls being governesses," said Mrs. Wyndham quietly, "I meant from this date, as nursery governesses, or *bonnes*, or something of that sort. As you say they have been six years with you, I am sure that ought to qualify them for all that need be required, above all since farther preparation is out of the question." And with this speech there was the inadvertent glance at the unexceptional lines of her jacket and gown, and the bland modulation of the mouth which had belonged to a beauty, and had already so annoyed Miss Cayley.

"It is out of the question," answered Miss Cayley, so curtly, thought her visitor, that for a schoolmistress she had a particularly bad manner. "Why, Anne is but fifteen, and Pleasance is little more than a child of thirteen. I do not approve of imposing responsibility on such juvenile teachers. I could not in conscience give them the recommendations which they should want from me, and as to keeping the girls here in that capacity, I do not require them, and their fellow-pupils are all too near them in age, for even Anne to have any authority. Besides, I have some idea in case of a—a call, which I fear from my only surviving relative, of giving up the school, that is, of selling the goodwill to my principal governess at a moment's notice." Miss Cayley's asperity was not lessened by the recollection of her own private trouble, but what really lent it the sharpest edge was the indignant consideration, "and the girls don't yet know that their father is dead."

"Ah! indeed," exclaimed Mrs. Wyndham, with no show of interest in Miss Cayley's trouble. "Very well, we shall say nothing more about that just now," she added, not so much like a woman who yielded the point, as like a woman who, in her dignity, was too callous to dispute where nothing was likely to come of it. "I find by my late brother's

papers, which have involved us in such a painful discovery, that these girls have some relation on the mother's side by the name of Balls."

"Mrs. Balls is the name of a housekeeper in an empty farm-house in Norfolk or Suffolk," said Miss Cayley. "The girls corresponded with her and went to see her once, as a cousin of their mother's."

"They had better go to her, she is the person who ought to have them," said Mrs. Wyndham.

"Here they are," said Miss Cayley, drawing a long breath, as steps sounded at the door.

CHAPTER II.—"BE QUICK, PLEASANCE, AND WE'LL WAIT FOR YOU."

THE message had to be carried to a school-room with benches, maps, globes, and books, its stereotyped order, which, with the union of bareness and cleanness would have had somewhat of a prison character, had it not been contradicted by little extravagant spurts of disorder, showing that the youthful are still more irrepressible than the criminal portion of society.

Two governesses, the one elderly and trained to tolerance and long-suffering, the other young and still divided between the ire and the severity of youth when it is conscientious, had been standing waiting for the last complement of a troop of girls, who were about to improve a fine spring half-holiday by a long country excursion.

The greater part of the girls had been standing also, in recognition of their superiors' attitude, at a respectful and convenient distance from the governesses; it had been but the laggards, usually the awkward squadron also, for whom there had been the delay.

Among the elder girls, whose various lighter woollen gowns and freshened prettier hats testified to their appreciation of the advancing season, and their gravitation to the budding period of woman's life, when neatness and individual taste begin to be a definite possession, stood Anne Hatton—a dark-haired, pale-complexioned, middle-sized, and slightly-made girl, who yet looked older than her years. Her face was decidedly pretty in a small-featured refined way, though it was deficient in the glow of youth; while it had none of that uncertainty of promise, which, while it may exist in actual defects that seriously mar the present harmony of a young girl's face and figure, has still a charm of its own in producing expectancy and unsatisfied curiosity.

Anne Hatton's promise was already in part fulfilled. The half-opened bud displayed exactly what the flower would be. This was a miniature woman, with a woman's earnestness, and scrupulous dutifulness, tenderness, and ambition in small.

We are apt to think of a miniature woman as being a baby or girlish embodiment, of vanity, affectation, and precocious worldliness; and no doubt Anne Hatton had, at fifteen, a fair growth of all the vanity, affectation, and worldliness of which she could ever be guilty, after the fashion of her sisters. But there are two lights, at least, in which to view women; and the higher womanly qualities, good and bad, ripen as soon in some instances as the lower,—the premature ripeness having the ordinary fate of what is, somehow, out of the course of nature, that of being exposed to extra hardship and suffering.

Anne Hatton had stood unable to join in the low-voiced conversation in which the elder girls were privileged to indulge in the presence of their governesses, as a court-circle may communicate in whispers round its sovereign. She had been fretting quietly because of her sister Pleasance being among the delinquents.

Anne was a pattern girl in her behaviour, but she could not rest, because Pleasance was not a pattern girl too. Anne was devoted to Pleasance, perhaps more so at this time than Pleasance was devoted to her. She was proud with an exceeding pride of Pleasance's cleverness and popularity. She prized and gloried in Pleasance's kindness and singleness of heart, but she would have had her heroine and darling immaculate. It was part of her own nature to be strictly accurate, punctual, methodical, and her unmixed school life had in her case exaggerated these valuable adjuncts to character, till they threatened to beget a rigidity of character. Withal there was blended with her womanly fervour and tenacity the girlish demureness of an unbroken school life, under a woman who was reasonable and good, and like all good women with the essence of motherliness in her, but who was still a schoolmistress, whose subordinates were naturally tenfold more schoolmistresses than herself. It hurt Anne like the commission of a wrong, to be confronted with slovenliness and disorder, and she positively writhed when Pleasance was habitually an offender under these heads.

Yet it was greatly owing to this that she was saved from the bann which, in school

communities, is apt to fall on pattern girls or boys. The conscientiousness of Pleasance's demerits, which rebounded on Anne with quite as much shame and remorse as if the demerits had been her own, modified the tendency to austerity in the elder sister, and at the same time furnished her with charity for other offenders. Thus Anne was not merely respected, which might have been supposed; she was liked, though in a different degree from Pleasance, at the Hayes, Miss Cayley's school.

"Miss Smith," said the younger governess, who blazed up at last, even to an attack on her superior and senior in command, "it is intolerable that we should be kept waiting like this. Are you to allow it any longer?"

"What can we do, Miss Eckhard?" Miss Smith had remonstrated mildly, speaking in an undertone, in answer to the protest which had been delivered aloud, and had startled the girls into silence.

"What can we do, Miss Smith?" Miss Eckhard had repeated with passionate distinctness, forgetting that she was thus exposing any weakness in the position. "Why, set out, of course, and leave those who are too late at home."

"But you forget, my dear," Miss Smith had persisted, with all the careful consideration of calm dulness, and speaking in her cautious undertone, "that they would be sure to fall into mischief, and require to have tasks set to them which we should be engaged all the evening in hearing. I do so want to write home, and to mend my *jupes*, and to practise that old-fashioned sonata of Clementi's which Miss Cayley was so pleased with."

"I should not mind for letters, or *jupes*, or sonatas," Miss Eckhard had cried, still audibly, "but I should not be put upon and treated impertinently by a set of girls."

Anne had heard it all, and felt as if she could sink into the earth on Pleasance's account. She had been not so much resentful (she was too just for that) as vexed in her soul that Pleasance should be to blame and in disgrace. Yet she instantly identified herself with Pleasance.

"Miss Smith, may I go and hurry Pleasance?" she had started forward imploringly, and having received a nod from the accommodating elder, had darted off before Miss Eckhard could interfere. She was to discharge her own obligations and bear her own sins.

As if it had been possible for an obligation which affected Pleasance not to reach to

Anne, or as if Pleasance could suffer alone while Anne was there to suffer with her!

At the same time Anne had made up her mind, as she ran up the stairs quickly, but mindfully, to scold Pleasance roundly for getting the two into bad odour by her inveterate negligence.

"What are you about, Pleasance?" Anne had cried, in so sharp a voice that it had sounded like a wonderful imitation of Miss Cayley's, as she had entered the small dormitory which Miss Cayley had permitted the two sisters to have for their own bedroom and private apartment. "Do you know that Miss Smith and Miss Eckhard, and all the rest are waiting? Do you mean to make us waste all the afternoon? Oh dear, I am distressed to think of it!"

"No, no! Never mind, Anne; it will all come right now that you are here," a contrite yet hopeful voice had come from a youthful body bent double over a chest of drawers, two of which stood open with the contents pulled about in the wildest confusion.

"It is my gloves, Anne, have gone a roving, and my veil has followed them, and Miss Eckhard says I am to wear a veil upon my hat because of my eyes, though I hate veils, and I do not understand how, if I do not see well without a veil, I am to see better with one. But there will be forfeits, and you know I cannot afford any more, else I shall lose all my best marks—not that I should mind so much, but you would, if I had not the prizes in literature and history. Do, like a kitten, look for me. Things come to you to be found. I have searched Eupatoria and Balaclava till I am out of breath, and I can see no more trace of the missing plagues than if they had been spirited away." And the searcher rose from her efforts, and sank exhausted on the top of a trunk.

"Pleasance, I wonder at you!" Anne had begun, even while she proceeded to dive promptly, as requested, into the heterogeneous mass, but not without the disgust of her orderly nature at the unmitigated disorder; "and don't call me a kitten—I won't have it," she had said by snatches, in the middle of her eager occupation. "Miss Cayley dislikes nicknames and silly pet-names, and this is so silly and inappropriate."

"Yes," Pleasance had granted reluctantly; "but kittens are so dreadfully nice. I know that you will say things cannot be at once dreadful and nice," Pleasance argued, taking to talking at her ease on her trunk; "but you are mistaken. Things are often dreadfully nice; there is no other expression strong

enough for them, since Miss Cayley frightened us all by saying that there was nothing awful save the day of judgment. I think Dean Swift called poor Stella a kitten; at least I am sure that it was he who wrote the dear little ditty—

'Oh my kitten, my kitten, Oh my kitten, my darling!'

"The more fool he, and never mind Dean Swift. What drawers! and I put them all in such excellent order for you only last week, that Miss Eckhard might look over them on Saturday."

Anne reproached Pleasance almost plaintively, so that Pleasance felt quite cut up, and mumbled disconsolately—

"I know it is a very bad return to you, Anne, but I cannot help it; they will go wrong."

"I think if you would be more serious, and leave off giving them those foolish names," sighed Anne, not wishing to discourage her sister further—indeed, already relenting at the sight and sound of Pleasance's humiliation.

"But they are so appropriate," Pleasance pled, "after what we read of the harbours during the Crimean war. You found fault with me just now for the inappropriateness of calling you a kitten—though you know you are a little like a grown-up pussy-cat, Anne, just a well-behaved, steady kind of a beast—but at least you cannot complain of my not hitting the mark in my comparison of the drawers."

The two sisters, dressed alike in grey camlet gowns and jackets, and with grey felt hats, bore little resemblance to each other. Pleasance at thirteen was as tall as Anne at fifteen, and promised in course of time to be the taller. She had already the bigger framework of a woman, out of proportion in this stage, and a little clumsy, particularly as it was angular and not rounded. Pleasance's hair was in colour that dusky brown which, when it is rumpled—its normal condition in her case—looks dusty; her complexion was muddled, though it was not coarse; her nose was a little thick, though tolerable in form; her mouth was full, with undecided lines; her eyes were a hazel grey, but had commenced to develop the blink of short sight; her low, broad forehead was partly concealed by her unruly hair and her hat. The best thing about her face was the fine round oval of the contour, and the bright, honest expression of the countenance.

"Here is the veil," Anne had ejaculated, pulling a wisp of blue gauze from a gordian-

knot of ribands and scarfs, "and I shall lend you a pair of gloves, and tell Miss Smith that I have done so, for we cannot stay any longer."

At that moment there was a brisk tap at the door, which was at once opened by the prim, sober housemaid, who announced—

"Please, Miss Hatton, Miss Cayley has sent to Miss Smith that she wishes you and Miss Pleasance in the drawing-room. Miss Smith says that you are to go straight to her, to be sent down-stairs."

Anne looked surprised, while she answered, "Very well, Elizabeth. Please, tell Miss Smith we shall come immediately."

Pleasance stood convinced that her enormities in making away with gloves and veils had attained such an eminence that she was formally summoned before Miss Cayley to answer for them, while Anne was to be exposed to fresh mortification on her account.

In the meantime Anne, with light sleight-of-hand, was putting a finishing-touch of smoothness to her own smooth cuffs, gloves, and neck-tie, and preparing to do what she could in the briefest space of time to soften Pleasance's general roughness; but while she was not startled into forgetfulness of these offices, a little delicate colour was rising and increasing in her cheek, and a light coming into her grey eyes.

"Clara Anderson told me there was a visitor with Miss Cayley," she said; "it must be somebody for us."

"But who can it be, kit—Anne, seeing that we have nobody belonging to us except papa, and he is at New Orleans?" questioned Pleasance, not fairly aroused to this new light on the position, and at the same time awakening to the fear that she was to lose the half-holiday excursion after all. As she spoke she stood helplessly, but with a few twinges of discontent to be put to rights, very much like a young colt who is called upon to have the appearance of a well-conducted and cared-for horse, standing to be rubbed down.

"It may be somebody from papa—it may be papa himself," cried Anne, getting redder and redder, and with an ever-brightening light in her eyes, while she did not desist from making darts at the borrowed gloves on Pleasance's hands to button them, and at Pleasance's feet to see if her boots were as they should be.

"No, Anne, it cannot be," gasped Pleasance, all aroused now, "he never said he was coming home just now."

Pleasance exhibited that singular sudden

failure of imagination, which the most imaginative people sometimes experience when their special faculty is all at once brought to bear on that practical life with which their fancy has not been wont to meddle.

"He may be going to surprise us, it is past our usual time of hearing from him," said Anne, running on as if she were the quick-witted sister, while the two were going down-stairs together, Pleasance stumbling and hanging back in what was to Anne an utterly unaccountable fashion.

"Stay a moment, Anne—it is so long since we have seen him, if it be papa—what are we to do or to say to him?" Pleasance besought Anne piteously, while a sudden horror of shyness met, and struggled with the lingering childish fondness for her father; and she felt as if this unexpected meeting with him was a trial which she could not encounter.

"I cannot stay," Anne threw back with rare haste for her, and altogether unable to comprehend this phase of bashful misery and reluctance on Pleasance's part. "What shall we say? that we are only too glad and thankful that he is come safe home—I hope to stay—as to be sure we are."

It had been the cherished dream of Anne's life, this return of her father; she had been little older than Pleasance when the father and children parted, and, doubtless, in the nature of things, it was a wistful idealised memory, rather than the real father whom Anne had loved, but that shadow represented her father, and to that she had steadfastly clung.

Anne had not been unhappy at school, she was sensible of the school's advantages, and anxious to profit by them; but these were to enable her to play her part better when her father came home,—that was the goal of all.

Anne felt that papa ought to return, and take her and Pleasance to keep house for him. That would be so much nicer than the isolated circumstances of the girls even with a friendly schoolmistress. In listening to the experiences of the other girls, this had jarred on and pained Anne still more than it had pained Pleasance, though it had been Pleasance who had sighed and pined the most for the variety and indulgence of home holidays. It was not more indulgences, it was more, if nearer and dearer duties, that Anne craved.

Anne had known enough to judge that her father was not a rich man, that he had not a profession or business which might make him a rich man, some day, that he was a

voluntary wanderer, somehow separated from his family, a fact which, as their mother had possessed few relations in her humble station, had left his daughters almost without friends. But he was all the more her's and Pleasance's, and as fifteen is hardly ever without an imagination of some kind, Anne had conjured up many a pleasant vision of the household that was to be.

It might be a quiet simple household, but it should be so well ordered, so becoming a true gentleman and his daughters (for Anne was as largely endowed with pride as Pleasance was destitute of it), so different from the vulgar profusion and excess of which Maria Hollis was given to boast, as existing in her father's house.

Pleasance was by no means sure that she was glad and thankful for her father's return, at this moment, though she hoped that she would be the moment the ordeal of their meeting was over. At present she was not sure that she should know him when she saw him; and withal there crossed her mind an inopportune regret for the loss of the country excursion.

Anne did not much care for country excursions, she was delicate and easily fatigued. To her, long walking parties—in April weather above all—meant, among other things, muddy roads, soiled skirts, and weariness for the rest of the day.

But this was just the sort of pleasure that Pleasance doted on, it was better than being one of the draft of pupils, promoted into drinking tea in the drawing-room with Miss Cayley, though Pleasance was, wonderful to relate, fond of Miss Cayley; it was better than a working party, better than charades or toffee-making, better even than a new book, whether prize or gift. And this excursion was to have skirted Covey Wood, and Pleasance had been so hugging herself with the wild daffodils which were to be gathered in the meadows there, and the squirrels and hedgehogs which were to be seen in the wood. It was not the real daffodils so much that Pleasance coveted, it was a dim yellow glory of Shakespeare's daffodils scenting the winds of March with beauty, and Herrick's daffodils fading away so soon, which had taken possession of the poetry-haunted girl's fancy. But it was the real squirrels and hedgehogs, for along with her intellectual bent Pleasance had the extravagant love of animals which is oftener found in school-boys than in school-girls. It was not doomed to die of inanition, Miss Cayley's being a country school, and Miss

Cayley herself being at least as broad as she was sharp in her theory and practice. Pleasance was allowed to cultivate a warm friendship with the house-dog, and with sundry cats, and caged birds; but Miss Cayley did object to a hatch of rabbits to be fed and tended, and to mice kept in a box in the tool-house, so that Pleasance, for extending her acquaintance in the animal kingdom, had to depend on such walks as this to Covey Wood.

The two girls had passed muster before Miss Smith, and been told that they would do, and might go in to Miss Cayley, but Miss Smith could not promise to wait for them.

"Be quick, Pleasance, and we'll wait," whispered some of the younger girls to whom the withdrawal of Pleasance, with her quips and cranks, and stories to lighten the road, was a grievous prospect. "There is a shower coming, and we must wait for that now, and, besides, neither Ellen Millar nor Amy Worsley are down yet."

In the prospect which ought to have been such a happy one, and was yet for the moment so alarming as it lay before her, Pleasance could not take much comfort from the friendly assurance, and Anne for the first time was unsympathetic. Anne had so often rehearsed what she was to do when her father came home, that the rehearsal remained at her finger ends, and the tip of her tongue.

Pleasance glanced out of the hall windows as she and Anne passed through to the drawing-room. A cloud was over the sky, but it was an April cloud with silvery light on its fringes, with the blue sky doubly blue and fresh, and spring-like beyond. It seemed to Pleasance as if she could almost smell the daffodils, and hear the rustling of the boughs upon which the squirrels sprung, and beneath which the hedgehogs scuttled when Anne turned the handle of the door, and the two girls were in the drawing-room.

CHAPTER III.—"YOUR FATHER HAS BEEN TAKEN FROM YOU."

ANNE looked eagerly before her. Pleasance lifted her dazzled eyes from the ground. There was no tall, prematurely grey-haired man with restless movements, and a face like Pleasance's. There was no one with Miss Cayley save a large handsome woman in deep mourning, who stared stonily at the girls, without rising for a moment, as she reflected that the elder was too pretty by half, and the younger looked too like an over-

grown child, which was exactly what Pleasance did look at that moment.

"My dears," said Miss Cayley, "here is an aunt of yours whom you have not seen."

Miss Cayley rarely called her pupils dears, and never before their friends; but, though it may be that a schoolmistress should be equal to any occasion, she was put out at this moment, and she said "dears" in a spirit of

contradiction, and blurted out the relationship with a sense of savage satisfaction.

The moment after Miss Cayley had spoken, she felt that she had done wrong, though she did not know very well what else she could have said. She had better not have spoken at all than have made this speech. To prevent herself from working farther harm which would come back upon the girls, she

Page 38.

quitted the room, and left the aunt and nieces to have their meeting in private. She halted in the hall, thinking of the communication that was to be made, and wishing to be at hand. She had said to herself there would be no scene; but Anne Hatton was delicate, and Pleasance was very young, and she was not of opinion that Mrs. Wyndham could spare the girls, even if she

would. What if Anne fainted, or Pleasance cried aloud? But a few moments passed, and there was neither sound of dull fall nor sharp cry, and Miss Cayley's mind was set at rest so far.

"As we have not seen each other before, we cannot be very familiar, can we?" asked Mrs. Wyndham languidly, rising, taking a step forward, and touching the girl's hands

with her gloved fingers. "Pray, sit down, I wish to talk to you."

Pleasance was still occupied with her half relief, half disappointment. She really believed that disappointment preponderated now at not finding her strange father, otherwise her stately, handsome aunt in the deep mourning would have made a strong impression upon her. Whether she would have appreciated the peculiarity of that aunt's manner, was another question; for there were some things in which Pleasance was as slow and far back, as she was quick and far forward in others.

But Anne felt the peculiarity at once and keenly. With more capacity for piecing together the portions of their father and mother's history with which she was acquainted than Pleasance possessed, Anne knew instinctively that there was something wrong. The acquisition of colour with which she had entered the room faded so fast as to add to Mrs. Wyndham's other vexed considerations the additional annoyance, "she is sickly too."

"I beg your pardon," said Anne, not sitting down, and with a great effort to check her agitation, "but have you brought us a message from papa?"

The question thrilled even through Mrs. Wyndham.

"Not exactly," she said, hesitating a little; "but you must have almost forgotten your father, since it seems you were quite children when he left England."

"Forgotten papa!" exclaimed Anne, as annoyed as she was indignant. "Why, Pleasance, who is two years younger than I, can remember him perfectly."

Pleasance felt a little guilty. Such a big wonderful world had begun to open upon her, since she was the little girl of seven years, whom her father had led by the hand, to whom he had given donkey rides and sugar-plums, and who had run crying to the door after him, and sobbed herself to sleep though her doll was in her arms, on the night of the day on which he had bidden them good by. But happily she was not called upon to speak and admit her sin of memory.

"And we have been constantly hearing from papa, and looking for his coming home," continued Anne, feeling that she was maintaining both his dignity and her own by asserting the strength and constancy of the relation.

"But still it cannot be the same feeling," insisted Mrs. Wyndham. "I wish you would sit down when I require you," she said, in parenthesis, and the girls, used to obedience,

sat down in their bewilderment and sense of offence. "It cannot be the same feeling to you as to girls who have been with their fathers every day of their lives to hear what I need not say is the will of God, and must be submitted to, that your poor father has been taken from you."

Pleasance gave a great start, gasp, and shiver; a moment ago she had not wished to see her father, and now she was told that she was never to see him again.

The last particle of colour ebbed in a second from Anne's face, leaving her poor lips white, but she did not faint; she recovered herself with a womanly protest of incredulous anguish, "Not dead, surely not dead, only very ill, I can go to him and nurse him."

"He died at New Orleans, six weeks ago," Mrs. Wyndham went on with her task calmly, satisfied that she had been right and was now reassured by the satisfaction—these unacknowledged, boarded-away children had not had much to do with their father, and could not mourn him acutely—and neither had shed a tear as yet. "The death was sudden; your father was saved much pain; I have brought the letter which conveyed the particulars to me, or rather to my husband; here it is," and Mrs. Wyndham drew the thin dark blue sheet in its envelope from her pocket. "You may have it, if you please; as to your having gone to nurse him—had he suffered from a long illness—at your age, what with the distance and the expense of the journey, it would have been out of the question."

"Has papa left nothing for us?" inquired Anne piteously, holding the offered letter unopened.

"I believe your father has left very little money," answered Mrs. Wyndham coldly; "he had almost spent his patrimony," while she made the silent commentary, "It is better that they should be apprised of their penniless position at once. But how race will come out! What a vulgarly calculating, and sordid inquiry from a girl of fifteen, who has just learnt that she is fatherless!"

"I did not mean that, I do not care for money," cried Anne, desperately. "But was there no letter, no word for us?"

"No, and it was not likely that there should have been," Mrs. Wyndham replied, not caring to have her disparaging conclusion removed, and not quite believing in the explanation. "Your father had no reason to apprehend his death; besides, he was never a foreseeing man. As to your not caring for money, that is an ignorant speech, apt to be

insincere, even from a girl; however, let it pass just now. You seem able to investigate matters; I do not object to that, there is nothing more desirable for you than self-reliance. Anne Hatton—I think Anne is your Christian name?—I had better speak plainly to you. I have come a long distance at great inconvenience, to see you and tell you of your father's death, and settle matters;" and as Mrs. Wyndham named the exertions and sacrifices which she had accomplished, a sense of virtue fortified her still further, and she was so entirely herself again, after the slight disturbance she had sustained, that she could cast down her eyes on the faultless style of her sleeve, and make the bland modulation of her lips, while Anne sat sick and stunned with the shock which had come upon her.

"When my poor brother, your father," went on Mrs. Wyndham, "married your mother, against whom I have not a word to say, as I never saw her or even heard of her existence till the other day, he chose to take his wife from a class much below his own, and he did not think fit to make his family acquainted with his marriage. The first information which we had of it was from the certificate of his marriage and the registers of your and your sister's births, which were discovered and forwarded to us amongst his papers. The consequence is this very awkward situation." Mrs. Wyndham uttered the last words with emphasis, and then paused.

Anne heard dully; a certain explanation of a state of affairs that she had only known partially, and which had puzzled her, reached her mind through her misery; but she could not, even when she was conscious that an aspersion was cast upon her father, raise her voice and justify him.

Mrs. Wyndham was not displeased with the effect of her plain speaking; she thought the girl was going, after all, to be submissive and easily managed.

"You must be aware that under the circumstances, you have very little claim upon me and my husband; but we shall do what we can for you and your sister—that is, in laying out your money, a few hundred pounds, to put you in a position in which you may become independent. In the meantime I think you had better leave the school at once. I understand that you have a relation of whom you do know something, named Balls. I should like you to go to her."

At the conclusion of this speech, as Anne listened, white and cold and still—as if she were frozen—as if it had been she that had been struck dead in the midst of life—some-

thing of a wild, appalled look came into her fixed eyes; yet she said nothing, her readiness in the most untoward circumstances which she had known, or could have anticipated, utterly forsook her when chaos was come and she was called on to face undreamt-of disaster.

With that silence of Anne's another marvel came to pass—Pleasance, who had never spoken in a difficulty before, spoke now for herself and Anne also. She was sitting with large tears coursing down her face, but with a quietness in her crying which might have struck Mrs. Wyndham—if she had been really observant or susceptible to other than her preconceived notions—quite as much as the circumstance of neither of the girls having cried at all on the first announcement of their father's death.

"Oh, yes, Anne," said Pleasance, "let us go to Mrs. Balls; she is always at home, and will be pleased to have us, and then we can see what we shall do."

In the midst of her dumb distress, it was to Anne, who had been accustomed to regard Pleasance—the cleverest girl of her age at school—as a baby when removed from her lessons and her books, very much what it must have been to the old Roman citizens when Brutus spoke in the emergency of the state, no longer with the voice of an inspired idiot, but of a rational man and born leader—the one who intuitively, by the right of his nature, comes to the front and takes the lead when the blow strikes.

Still Anne was silent—"sulky," conjectured Mrs. Wyndham. But silence gives consent, even if the other girl had not spoken for the two.

So Mrs. Wyndham, without more ado, sent for Miss Cayley, and announced that the girls were to leave the Hayes directly; indeed, as a fly was waiting to carry her back to the station, and as that station happened to be a railway junction, with a line which led to the eastern counties, among lines in other directions, she thought it would be safer for her to take the girls—she had not once called them her nieces—with her, and see them so far on their way to their mother's relations. When Mrs. Wyndham completed this arrangement, she felt her behaviour to be so exemplary, that virtue could ask nothing farther from her.

Miss Cayley demurred at first, as far as was in her power. She expressed her perfect willingness to keep the girls with her for some time. She let Mrs. Wyndham clearly understand that the school-terms were all paid in advance,

and that the Misses Hatton's term was not out. Under the stress of her feelings, Miss Cayley would even have extended her hospitality to Mrs. Wyndham, and begged her to stay at least over one night, till the girls had recovered from the first shock of her melancholy tidings.

But, no. When Mrs. Wyndham had made up her mind, she adhered to her decision; she had got matters in fair train, her *coup de main* had been as yet wonderfully successful, and she did not know what revolt and reassertion of old views to-morrow might bring, and she had a long way to return to Sufton Hall. The family were going up to town for the season, but in the first place she wished to take her daughters to the seaside for a week, as on account of the affliction in the family, they had lost their Easter holidays—and so she had not a moment to spare.

"Please, Miss Cayley," whispered Pleasance, "I think we had better go at once. I think it would be worse if we stayed a little longer."

Was it Pleasance who spoke? Miss Cayley was confused and excited, what with these girls' misfortunes and her own trouble. On second thoughts, she was not astonished that it was Pleasance who had found voice, though it brought the moisture to eyes which had been too busy for many a year to have leisure for idle sentimental weeping, to distinguish that the crisis in the girl's life had come in such a fashion. But young oracles were not always the blindest and most blundering; it might be easier for the girls not to meet their companions in their changed circumstances. Miss Cayley herself might be gone within another week; so she undertook to pack up the Hattons' clothes and books, and send them after the girls, and to make their farewells to the rest of the house.

As Pleasance left the drawing-room following Anne, who had let others settle for her, and who was walking tottering, Pleasance glanced again out of the hall-windows. Why did she do it? What did it matter now whether the sun shone or the rain fell? She should go on no more country excursions from the Hayes. The daffodils, squirrels, and hedgehogs seemed already removed so far away, that they might have been withered and scentless skeletons and dust these hundred years. The girls would have had to wait long indeed if they had kept their promise and waited for her. It was not they who had left her, but she who had left them for ever behind.

Pleasance searched for and got a little carriage bag, which was the sisters' property; she remembered about taking their night-dresses and put them in it for herself and Anne. She swallowed the wine which Miss Cayley brought her, and made Anne swallow her wine. She said, "Now, Anne!" and marshalled Anne down-stairs, and bade "good-bye" for the two to the wondering servants, as if she had taken care of Anne, and not Anne had taken care of her, all the years of her life. She did not break down even when Miss Cayley said, "God bless you, child," and whispered into her ear, not into Anne's, "Remember, if I can ever do anything for you, I shall be glad to do it."

CHAPTER IV.—THE STEPS OF THE DESCENT.

ANNE sat like a statue on the back-seat of the fly which was carrying her and Pleasance with Mrs. Wyndham, not to the station merely, but away from the Hayes, to another state of existence. Anne's fine little face had an old, pinched look, a look which doctors fear to see on the faces of babies a week old, as she sat beside Pleasance, who occupied the same seat, Mrs. Wyndham's dignity and ample proportions filling up the front seat. Pleasance had the tears again streaming down her face, while she strained her eyes and ears to catch the last sights and sounds of the Hayes—the lime-trees, beneath which was Miss Cayley's walk; the beeches which held the girls' swing, where she had oftener sat and read than swung; the boxwood bush, where she knew of neighbouring pairs of thrushes' and of black-birds' nests, already built and holding treasures of blue, and blue and green-speckled eggs; the very bark of Tyke! If she had been able just once unseen to clasp her arms round Tyke's neck, and press her lips to the white star on his forehead, and ask him to remember her till she came back again, only not to miss her too much, and fail to enjoy the bones and crusts which the hand of somebody else would bring him! The heart of the girl who had just learnt the loss of her father, and who had been accused of not at once shedding tears for the loss, swelled at the thought of not saying good-bye to Tyke. But Pleasance bit her lip to keep down the choking sensation in her throat; she was not going to sob before that stranger kinswoman who had conducted herself so coldly, and let them know she was to continue strange to them.

When the station was reached Mrs. Wynd-

"WHAT SHE CAME THROUGH."

ham's north-western train was nearly due, but she made inquiries as to the starting of the eastern trains, and took out and paid for the girls' tickets to the little country station which Pleasance told her they knew quite well. Then she held out her perfectly-gloved fingers and said, "Good-bye; I think you will find no difficulty, my address is on the letter which I gave to one of you. You may write to tell me what you and your mother's relations fix upon with regard to your future, and I shall answer you and let you know what Mr. Wyndham's lawyer agrees to do about your money—it is very little, remember, as well as I can tell you, not four hundred pounds (your father had let himself get nearly destitute), of course not enough for you to live upon, even for a few years, and you are not entitled to touch it till you are of age. But if your relatives think of anything for you, we shall see what can be done. Ah! that is my bell. I see the train. Once more good-bye."

There was a rattle and rush, a confused crowding to one centre of excitement on the platform, in which Mrs. Wyndham passed away, preserving her assured deliberation to the last; then with another rattle and whiz the train steamed out of the station, and Anne and Pleasance Hatton were left standing alone on the borders of a little crowd of excited arrivals and bustling officials to whom they were unknown.

"Come this way, Anne." Pleasance drew her sister away to what was still the retired promenade of their eastern platform. "Anne, dear, oh! look up and speak to me, and tell me, like yourself, what we shall do. There is nobody here but me; that strange woman, that aunt who has been so much less than kind is gone; and Anne, if papa is dead, you have still me," urged Pleasance, getting frightened at her sister's long-continued immobility.

The familiar voice, with its old all-powerful appeal, and the knowledge that the two were alone together, did something to arouse Anne.

"Oh, Pleasance, I am so cold," she said at last with a sick shudder.

The April day was past its noon, and its early brightness had sunk into a damp grey atmosphere, as if it had been November; only outside the station spring work was going on briskly and cheerily in the fields, where calves and lambs were nibbling at the sprouting grass, among which were tufts of primroses, while rooks sailed cawing across the sky, and in the trees and shrubs at the

Hayes, a continual twittering and piping of the lesser birds made faint and shrill accompaniments to the mellow songs which the blackbirds and thrushes were already singing to their mates.

It was past the season of even the most comfortless waiting-room fire, and Pleasance could think of nothing better for her sister, whom sorrow and humiliation had chilled to the marrow, than begging her to walk up and down, to cause the stagnant blood to circulate anew, till the appointed time for the arrival and departure of their train.

The motion, the open air, the companionship of Pleasance, helped still farther to thaw Anne's deadly rigidity, and to open the flood-gates of the tide which was engulfing and stifling the beating of her heart.

"Oh, Pleasance, how could papa do it?" she said, her breast heaving with short, hard sobs, referring to the unkindest cut of all.

"Do what?" asked Pleasance, so thankful to hear Anne speak again, that she was seized with one of her stupid fits, which alternated with her girlish cleverness, and hardly knew what she herself was saying, not to say what Anne meant.

"Make such a marriage as he was ashamed to own—fail to own mamma or us—leave us to bear the consequences."

"But he could not help dying," remonstrated Pleasance in a low tone; "he would have come back if he could, and made everything right."

"Oh, what a wicked wretch I am," cried Anne, her sorrow taking a new turn, "to complain of papa, and he lying, laid in a far-away grave, which we shall never, never see!"

"But you were hurrying to meet papa and to welcome him," Pleasance reminded Anne, her own voice breaking down with grief, "and I did not want to see him just then; I grudged him the small sacrifice of my walk." And the forlorn girls mingled their innocent remorse with their sorrow.

The little station for which the girls were bound was four hours' journey from the junction. It was getting dusk when the train at last approached its destination. It had carried them out of the wooded southern county through intermediate ground into a new country—level, bare, with a spring bleakness in its miles of ditch-divided, well-watered pastures, and with old towns by the slow rivers, and little churches and hamlets scattered between.

But the girls had been there before, and were aware that they had only half a mile

of quiet country road to traverse to reach the Manor, while they had no luggage to render their transportation difficult.

Even that half mile was hard upon Anne's throbbing head and trembling limbs. As for Pleasance, in the midst of her tribulation, she had a dim sense of pleasure in walking there, and in recalling the various objects that were faintly distinguishable.

"See, Anne, yonder is one of the wind-mills"—she could not help pointing out a gaunt object on the horizon—"and there must be others all round, for I counted as many as seven seen at a time when I was here before. I believe these are birds from the Broad," she added, with still more animation, as a flock of wild-fowl flew overhead, "and if it were not getting so dark," peering eagerly with her short-sighted eyes into the obscurity, "I am sure I could find the direction of the moor."

"Don't, Pleasance, don't," forbade Anne, with an accent of shrinking pain, for it seemed to her that her sister's voice sounded elated, and what childish levity it would be in Pleasance if she could find satisfaction in any outward object after the dreadful misfortune which had befallen them!

Pleasance sank into rebuked silence. She, too, was shocked at her own thoughtlessness when she remembered that after the last time she had been there she had written a full description of all the novelties of the scene to their father. His short letters had still taken notice of and encouraged their girlish confidences; and as beyond a little inspection of grammar and spelling the girls at Miss Cayley's school had been let write very much what they chose, Pleasance's letters to her father had been more of a pleasure than a task, and had proved, little as she remembered of him personally, a happy outlet for her expanding nature. The knowledge that the correspondence was closed perhaps gave Pleasance the liveliest present sense and foretaste of her loss.

At last, when Anne's footsteps had become feeble to halting, the Manor came in sight.

If it had ever been a squire's seat, as its name seemed to imply, it had fallen out of its rank so many generations back, that only its rambling extent, and a cluster of huge, hoary round-headed Spanish chestnuts and walnut trees still rising behind the house, in a country where trees were scarce, remained as vestiges of its former estate. The house stood close to the road, which was but a by-way through pasture fields leading past

the farm-house to the village of Saxford. Two low, wide gables, yellow plastered, and surmounted with olive-green thatch—the whole having a warm look in the grey April twilight, formed the front, while the building extended backwards from the one gable in a long wavy line, bulging out here and there with age, and with the superstructures of different periods in its history, till it terminated in offices, outhouses for cattle, and a straw-yard. The windows were strewn broad-cast—just below the thatch, at one side, in the middle, up and down, here and there. With regard to the windows themselves, some were mere slits, some tall and comparatively narrow, some broad and low, like the gables they pierced. Above the door was a triangular stone porch, on which lichens, mosses, and house-leeks flourished. From one window, which was only half screened, a ruddy light glowed.

To the door, as the girls' feet approached it, came a stout elderly woman of some sixty years, wearing a stuff gown, with the cuffs turned up, a clean apron, and an old-fashioned approach to a cap, which covered decently her silver-grey braids of hair, while it bordered, if it did not shade, her face, which even in years was an apple face, round in its wrinkles, retaining streaks of scarlet, and lit up with twinkling eyes.

"Lor' 'a mussy," she cried, the moment she distinguished her visitors, "it be Miss Hatton and Miss Pleasance. Mawther and wumman I were never so taken. I 'ont say you're not like flowers in May, but why han't you tow'd me you were a-coming, so that I might hev had things tidy and pretty, but now, when you d' walk up like tew sperrits in the darkening, nor'n's ready for you."

"You are here, and that is enough, Mrs. Balls," said Pleasance, grasping the old woman's hand, and trying to make up for Anne's silence. "We could not tell you, for we did not know ourselves that we were coming, and here is my sister fit to sink."

"I never! and I, like an owd fool, keeping you standing on the door-step axing you all mander on questions; but you'll not say another word till you're rested and wittled. Come into the kitchen, since the best room ain't aired. Throw off your things on the dresser, sit you down on each side of the chimley, for it d' feel damp and drizzly—they spring days go off so. Now, what 'll you 'a for supper?—a rasher, poached eggs, a half dozen real Norfolk biffins, roasted as you had them, and praised them the last time—tell me, do?"

"Any of them—anything you like, Mrs. Balls," said Pleasance, as the girls entered the low-browed kitchen, with its heavy beams hung with fitches, and its projecting chimney garlanded with onions and dried herbs.

"Anything that will give you the least trouble, Mrs. Balls," echoed Anne faintly, while she went after Pleasance, who was willingly casting aside her hat, jacket, and gloves, and followed her example with a half unconscious sigh of discomfort, as Anne glanced at the great, heavy, hacked, but well scrubbed dresser, that looked as if it must have carried many a meal of boiled pork and cold greens, roasted pork and Norfolk dumplings.

"No, it ain't a bit what I like, but what you tew like," said the hostess emphatically. "As for trouble, don't 'ee think to affront me! Ain't I Molly Balls! and ain't you, my two misses, children of my cousin Pleasance as made the great marriage, and were quite the lady, but were allers the same kind gal to me? I'll tell you what I'll do, I'll give you all the dishes I hev said, on'y the one after the other, and you'll be eating the one as I d' be cooking the other, and I'll draw a pitcher of ale and a jug of cider; then, when your warmed and filled and rested, you'll tell me why you've come athrowt word sent, and kinder stammed me."

It was with difficulty that Mrs. Balls could be restrained in her hospitable intent, and persuaded that the girls could not eat and drink, in any circumstances, like a couple of day labourers or farm lasses.

Anne and Pleasance sat each sunk and swallowed up in a great old oaken elbow chair—possible relics of the Manor when it was a true Manor-house—with the fire which cooked their supper falling full upon, and playing with, their youthful figures, their wan tear-dimmed faces, their heavy eyes, and their ruffled bare hair.

But, true to her word, though Mrs. Balls clearly perceived something was amiss, and although with the keen, seldom-restrained gossiping propensities of her class, she was dying with curiosity to get at the truth, so that she could neither eat nor drink with her guests, but felt, as she said to herself, as if her "inside were dried up," she put not another question. She contented herself after her preparations for the meal were ended, by sitting down opposite the girls, and with her elbows resting on the little round table drawn for their better accommodation before the fire, gazed her fill at them, unaware that she was doing anything to disturb them

while they ate their supper, or, as she complained, "picked like sparrers." The description was true of Anne, who only swallowed with difficulty a few morsels, but Pleasance's healthy young appetite, to her shame, was ready for the food.

Mrs. Balls was the more willing to accept Pleasance's small feats in return for her hostess cares, since, with the conclusion of the meal, she was able, according to her understanding with herself, to say—

"Now, on'y one word—you ain't runned away? I thought your school and missus were of the right down good sort; but there is never no knowing, and them schools are most traps, it seems to me."

"No, indeed, Mrs. Balls; we were sent away, we were sent here," Anne managed to say, while she could not help hanging her head even before her dead mother's humble cousin, as she, a pattern girl, had never thought to do before mortal man or woman.

"Mrs. Balls," Pleasance broke forth with her youthful engrained candour, "word has come that poor papa is dead. The news was brought by a lady who said she was papa's sister," continued Pleasance, volubly enough, not alive to any disgrace in the statement, and not noticing that Anne winced at every word. "We never saw the lady before, and I don't think she means to see any more of us, and I'm sure I don't care. I think the less we see of such relations—calling themselves relations—the better; but she arranged that we should leave Miss Cayley's this very day, and come to you."

"Dear hearts alive! bean't it a cruel shame?" exclaimed Mrs. Balls, with a flash of indignation. "You know it ain't that I ain't pleased and proud as a cropper to 'a you, and to be able to 'a you, as every poor single soul can't say to them as are her great relations;—but to be brought up like gentle-folks, on'y to be dashed down on a day's notice."

"Nobody can dash us down," interposed Anne with piteous pride; "we are just come to you, till we can look about us."

"You would be right welcome to come for good and all, Miss Hatton, if so be it were proper for you," replied Mrs. Balls, with homely earnestness that was not without dignity, "but you'll forgive me, that's of your blood, for axing if your gen'leman father, as ever behaved like a gen'leman to me—and I have none to say against him—han't left no perwision for his tew young ladies, as are more helpless than strapping country wenches with their fortune in their showder heads."

"I don't know much about it, Mrs. Balls," Pleasance hastened to say, feeling that the investigation was exquisitely painful to Anne.

"No, no! I dessay, my poor fine mawther, with all your know, what should you know about such things?" interrupted Mrs. Balls, half below her breath.

"But I think papa had very little to leave, and he could not tell that he was to die just yet, and not be able to do anything more for us. The lady who said she was his sister said something of money—a little, which we could not touch for an age, so that it does not seem much worth the thinking of—but we'll live together, and get along somehow. We are no worse than thousands of young orphan girls I have heard of. I am sure I shall be able to think of something."

"Hush, hush, Pleasance," Anne interrupted her sister, evidently infected by the spirit of adventure. "You don't know how my head aches, and surely there is time for all arrangements. But I must say to Mrs. Balls, are you sure that you will not be put about by our being here for a day or two, or a week or two?" Anne corrected herself with a sigh, "may not your master object?"

Anne spoke with the gentle consideration which was all her own, but with the distinct reserve which was quite as much a part of her in dealing with a woman like Mrs. Balls. It was not that Anne had not been taught to regard all men as brethren, and did not keep the precept in her own way; but she was without the imagination which made Pleasance at home with high and low. Anne's scrupulousness was in constant danger of being hurt, and the more she had tried the harder she would have found it, in the happiest circumstances, to fraternise with those removed from her by education and habit.

"None on he," said Mrs. Balls cheerily. "It is Lawyer Lockwood now—him as 'a succeeded the owd squire, and lawyer though he be, he lets well alone, and knows his own

place. He hev his business to mind—away over in the town o' Cheam, that is what they call a seaport, and he won't look over here once a month except when the milk is on. He d' know a good servant when he hev her, though you may larf to hear me say so. It were on'y Monday were a week that he hollered to me from his hoss's head, 'Aint you lonesome, dame?'—he allers calls me dame, like his owd uncle called me—'biding here by yourself winter and summer in this crazy owd barn. Ilan't you better 'a some company?'

"'No company is better'n bad company, Lawyer Lockwood,' I hollered back, for I clean forgot at that moment he had stepped into the owd squire's shoes, and I didn't know what fine company I 'ould have ere long. He larfed and rode on. And what thief in the wood tow'd you I could be put about with you and Miss Pleasance here, Miss Hatton? But your eyes d' be going together with sorrier and tiredness, you 'a had your troubles this day, and I must see about your bed. I pound it you 'a travelled nigh a hundred miles—as you tow'd me when you were here before."

Within less than an hour Anne and Pleasance were laid down between Mrs. Balls's clean coarse sheets, in a dimity-hung bed, in a large bare brown room.

Pleasance had fallen asleep, after a few sad thoughts of what was little more than a tender memory, with a pensive wonder whether the girls at the Hayes would be putting aside their books for prayers, and if Miss Eckhard would be sorry that she had kept her—Pleasance all the previous evening rewriting a badly-written exercise, and with some breathless expectations of the entirely unknown life in the future, which were rather inspiring than otherwise. But Anne lay wide awake ringing the changes on the dreary refrain, "Oh, papa, how could you do it? Oh, papa, poor papa, where are you now?"

PAUPER HOMES.

IT is possible to hatch birds and fish by machinery in thousands, but then the object is only to produce plenty of animals good to eat. We do not train human creatures with the same object, and it will be found that they cannot do without their nests. Year by year the number of thoughtful persons who hold this view increases, and

already there is good hope that no future huge manufactory of human machines will come into existence. With those that exist we must do the best we can, and it is difficult to limit the amount of good which may be done with them when once size and system are recognised as evils instead of being proclaimed as glories. Breaking-up and letting-

in are the two great remedies. At Norwich one form of breaking-up is on its trial, and the result is awaited with much anxiety. Letting-in is, however, still a hope, and not a fact. But when it is fully perceived that an inexorable system is only a necessary misfortune, inseparable from the assemblage of vast numbers, the object of those who administer it will no longer be to preserve it from infringement, but to infringe as much as they possibly can without giving it up altogether; and then we shall have social influences and personal affections introduced into the schools themselves, and the girls will come out with some ties already formed in the unknown world which they are entering, some faces which they have been accustomed to welcome, some friends to whom it will be easy and natural to go in trouble.

Not long ago it was mentioned to me as a triumph of modern practical science that forty operations for cataract had been performed in rapid succession in the eye-ward of a great hospital, and only the fortieth had failed. The nerve of the assistant gave way, and he dropped the patient's eyelid at the critical moment. Now this seems to me a very forcible illustration of the evil of dealing with human beings *en masse*, because it is a case in which they must necessarily be so dealt with, and in which we find the greatest number of advantages and the fewest chances of mishap that can be imagined. The skill and practice required for these delicate operations can exist only at a few centres (comparatively speaking), around which both patients and students must gather. The care and calm of a hospital ward do very much more than compensate those who are not rich enough to command a visit from the great surgeon in their own homes, for that disadvantage, as it cannot be supposed that such homes would supply favourable conditions, before, during, or after the crisis. Still, if those forty operations had been performed at different times and in different places, there would probably have been no failure at all. And there are persons so constituted that instead of considering the happy multitude who rejoiced in the light, they cannot help following the disappointed one who went back to the bitterness of his darkness. Sufferers are often curiously submissive. Perhaps he, too, had his word of admiration for the triumph of science and humanity which had passed him by, and it is quite possible that he admitted that in matters so delicate occasional failures are unavoidable, and saw no reason for blaming anybody

in the misfortune which deprived him of hope. If there must be a victim, why not he?

But the assembling together of vast multitudes of children of a low type, physical and moral, in order that they may be fitted for a low position in life, is without any such reason or explanation. It is simply a mistake. The good which is attained by gathering great numbers about a few centres is not the good which you primarily want in this case; and the inseparable evils are precisely those from which you are seeking to escape. You have a certain number of plastic years to deal with, during which you hope to merge the class and develop the individual, and you arrange your circumstances so that the class is isolated and the individual lost. Hundreds of village schools can supply all the intellectual teaching that is needed for pauper girls, while no huge pauper school can possibly provide the home element on which their hopes and their affections may feed, or the personal care and oversight under which their consciences may be developed. The evil here is not accidental or exceptional; it is not in the circumstances, but in the aim and essence of the work. And yet we have not even touched upon a greater evil; namely, the arrangement by which the most depraved and unhappy class of children in the kingdom is constantly passing through the great schools, remaining long enough to pollute the others, but not so long as to obtain any lasting benefit for themselves, even if they are capable of receiving it. Here, too, we may take a hospital illustration. In some of the larger hospitals a few fever cases are taken into the general wards, and the nurses assure you that the disease never spreads, though the wisdom of the course is questioned by many. But mark the difference. Fever patients so admitted are perhaps in the proportion of two per cent, while nearly half the inmates of a district school are "casuals." Moreover, the mischief, if any, caused by the presence of a fever patient is certainly discernible. You know whom he has infected, you trace the malady from its beginning to its close. But secrecy is the very essence of the moral poison diffused by depraved minds. It spreads invisibly, and you know nothing about it. You can neither correct nor cure. The very milk on which the children are feeding has in it the germs of a fatal disease, and you do not know what they have swallowed till they are dying.

The attempts to supply a thoroughly wholesome, natural training in lieu of the monster system, are of several kinds. There

are larger and smaller Orphanages and Homes, and there is Boarding-out proper. Of larger orphanages one of the most successful is that at Kendal, in Westmoreland, for thirty-five girls, which has been at work ten years. Eighty-four children have passed through it, of whom thirty-four are now in service, five in other known occupations, two married, and six dead. Thirty-four are at present in the Home. Only three are lost sight of. Several characteristics of this excellent little Home-school are worth notice. It has been worked from the first with the co-operation of the parochial authorities, who send there the class which, before 1865, would have been received into the union schools. The girls go to a National school about a mile from the Home: Daily exercise of the best kind, and daily intercourse with the un-pauper class—two inestimable advantages are thus secured. Every girl who at twelve years old is a fairly good scholar (one would like to know the standard) leaves school, and is employed in house-work at home till she is fourteen, when no difficulty is ever found in procuring her a respectable situation. She learns cooking, washing, cleaning, &c., not where the scale is so large and the machinery so complete that the lessons are practically useless for the future, but in a manner which has at least some resemblance to that in which she will hereafter have to apply what she has learned. The physique of these children is of course rather below the average, but they grow and improve during their school-life, their health is generally very good, and ophthalmia is unknown among them. The peculiar violence of temper which characterizes workhouse girls does not show itself under this training, and that "apathy" which Mrs. Senior and her assistants encountered everywhere, does not exist. They are as lively and as various in their ways and characters as other children. The total expense for each girl, including education, varies from £13 to £15 per annum. About half the expenses of this Home are defrayed by the parish authorities, half by private subscription; and its prosperity is mainly due to the generosity of one lady, who built the house, and contributes largely to it, and to the wisdom and goodness of another, who originally planned it.

There is another very interesting orphanage on a small scale, containing eight children, which is also working in concert with parish authorities, but is at present so young, and engaged in trying so many experiments, that

it would not be fair to name it just yet. Here variety is carefully studied both in food and dress, no two children being clothed alike. They have weekly pence, which they are allowed to save or spend at their own discretion. They attend a school in which the other children are not paupers. They have a capital matron, with a keen sense of humour, who really loves them, and is infinitely amused by their peculiarities. They have all the freedom of genuine family life. Of the happiness of these children there can be no doubt, and as they are under admirable teachers and trainers, it may confidently be expected that the "pauper element," which is so completely obliterated during their school days, will not re-appear in after-life.

Of boarding-out in England the year 1875 has nothing but good to tell. Thirty-two new committees have been formed, and sanctioned by the Local Government Board. Miss Preusser's report contains many entries pleasant to read. Emma S. is remarkably intelligent, "attends the National school, and is in the Fifth Standard." An orphan boy "has shown great ability at Diocesan school examinations, and the pride which his foster-parents take in his success is most gratifying." Children who arrive at the cottages with scrofulous or ophthalmic affections improve rapidly, and in some instances are already cured. One weakly boy gained ten pounds in weight in his first three months. The girls knit their own stockings and make their own underclothing, attend church and school, and are almost always reported to be "bright and happy." Difficulties of temper diminish, and untruthful habits are overcome. Strong affection grows up between foster-parents and children. One committee complains that the Board of Guardians, which made great difficulties about sending children, has not once caused them to be inspected, though inspection has been repeatedly solicited. In one instance, where payment was refused by a board after it had been discovered that the child belonged to another parish, the child was so happy and doing so well in her foster-home, that the Ladies' committee took her off the rates, and are maintaining her at their own expense. In another case the children are boarded in a very busy farm-house, and have plenty of useful work, in-doors and out, when not at school. The little narratives contain as much variety as other cottage biographies would contain, if fairly set down, and the little heroes and heroines have nothing of the pauper about them except

their origin, which they forget now, and perhaps may remember hereafter with a momentary pain, passing into thankfulness.

It is very desirable that statistics of the little orphanages, which are now springing up in many places, and which the present writer believes to be an excellent mode of attacking the pauper problem, should be accessible. Any information from such institutions will be gratefully received, as material for future articles. A single writer can of course only give her own opinion, but out of the free contact of opinions Truth will emerge, and I make my small contribution towards that consummation in no presumptuous or dictatorial spirit when I say that, for girls, it seems to me very desirable to multiply the numbers of these orphanages, and to keep down their size. I should be sorry to see more than thirty-five children in any; I think eight or ten quite enough. I should like to see small pauper orphanages attached to all the National schools in the kingdom. Much is now said of the desirableness of improving the character and position of the mistresses of primary schools, and of inducing gentlewomen to undertake the office. Is there any reason why a schoolmistress should not receive a little family of pauper boarders—say three or four—into her own cottage? There must be many cases in which this would be practicable, and such a scheme would certainly answer some of the most important exigencies of boarding-out, in its first conditions. You would secure a careful and respectable home, and a sufficient education. The tax on the mistress would not be heavy, as she would probably send her family to bed early enough to prevent them from disturbing the quiet of her evenings; and if it could be arranged that one of her inmates should be an elder girl, and the others several years younger, the little household would, under good management, soon work of itself, and enable her to dispense with a servant. Some ordinary schoolmistresses, who are, so to speak, wholly uneducated in moral and social questions, would probably at first cry out against the plan, which should not be pressed upon any one, but only recommended to the acceptance of those who are very anxious to do a little good work in the world. But everybody knows that this anxiety is professed and felt by great numbers of educated women at the present day, and I leave this suggestion for their consideration, merely adding that for a woman able to choose her own position, surely no better, no fuller, no more thoroughly

Christian work could be found than that of infusing her own higher and purer modes of thought into the education of her poorer sisters, and making a good and happy home for a few of the most desolate among them.

One word more about the little orphanages.

The first requisite seems to be that they should be as like homes as possible; the second, that they should be very plain, simple homes. Even a little roughness, so long as it is consistent with perfect cleanliness and order, and a few privations if they do not lower the sanitary standard, would seem desirable under the peculiar circumstances of the case. One of the most zealous of the advocates of the monster school mentions among its glories that the dining tables are warmed by hot-water pipes! Such an inversion of the natural argument tells with curious force in an opposite direction to that intended by the writer. No such expensive and luxurious arrangements are necessary where the natural number and life of a family are the conditions with which we have to deal. I think that a little orphanage should be made, as far as possible, the model and type of a perfect cottage home. The matron should take all her meals with her children, preserving order and teaching good manners by her presence, and by an occasional pleasantly spoken word to those who need it; the food should be plain, but of the most nourishing kind, because of the low physique of the pauper class; and quiet conversation at table should be promoted and encouraged, not only because it is a wholesome habit in itself, but because it tends to produce intimacy (which is a difficult matter in this relation), to open hearts, and to promote affection. It is also an eminently civilising habit. No tiresome or unnecessary restrictions should be made; everything which is likely to irritate or suppress the feelings of the half-formed creatures with whom we are dealing should be avoided with the utmost care. The freedom as well as the restraints of family life should be anxiously imitated, and always with the recollection that the family does not consist of ordinary children, who have been in our hands from the beginning, but, for the most part, of children who have inherited special tendencies towards evil, and who have learned early habits which they must now forget. There must be a certain reformatory element in the training of all such children, because we have not only to awaken and train, but probably to revive and to cure, a conscience which is, in many cases, not only dormant, but diseased. The

child has probably no clear sense of the difference between right and wrong ; do not confuse the first lessons on this, the most important subject which you have to teach, by giving it more than the simplest elements to consider. Make as few rules as possible, in order that you may have as few offences as possible, and see that these are real offences, and not of your making. Do not run the risk of teaching practically that a word spoken out of season is a greater sin than a wicked thought or a secret lie. Great leniency and tenderness towards every new-comer, much pleasant and friendly conference between matron and children about "showing the new girl our ways," an atmosphere of cheerfulness and brightness, as much mirth and liberty as are consistent with obedience—these are conditions which the best orphanages seek at all times to maintain, but which are perhaps not quite so generally understood as one would desire.

Orphanages and boarding-out are not, however, the only remedies for pauperism which we have to consider. Several societies have been formed with the object of supplying the pauper girl with a home and a help after her education-time is finished and her service-time begun. This excellent work is prospering as well as it can be expected to prosper under the enormous difficulties with which it has to contend. Where a girl leaves a cottage home or an orphanage these difficulties vanish because she has friends already. But the girl who leaves a pauper school knows nothing outside the wall of her seclusion, and she shrinks from the strangers who offer her protection, as a wild animal shrinks from the hand that would caress it. Birds and beasts may be caught and tamed, but the human animal runs away and feeds elsewhere. Not disheartened by the failures which are at present inevitable, helpers of the poor per-

severe in their labours, and much ground has been made ready for future occupation, some is already occupied. In one district only, a hundred poor servant-girls have been persuaded to become depositors in a penny-bank. This may seem a trifle to some, but it will not seem a trifle to those who remember that want of thrift is the great fault of the English poor, and one of the main sources of English pauperism. Still less does it seem a trifle when we consider it as a step towards obtaining influence over this inaccessible and unfortunate class. It is hoped that servants' homes and servants' friendly societies will continue and increase in numbers and persevere in work, in the face of all discouragements. The day will come when modifications will be attempted within the monster schools, when it will be acknowledged that a good influence from the world outside is greatly to be desired for the pauper girl before she enters it, and when consequently some means of introducing this influence without breaking down the system will be devised. The admission of lady-visitors to the infirmary and the play-ground, and an occasional "afternoon out," under their guidance, for small detachments of girls, would seem to furnish such a means, and when once this, or some similar plan, is adopted, all that authorities can do for the welfare of pauper girls will be accomplished. If, when this time arrives, there are already homes in existence, and societies of visiting and superintending ladies experienced in their work, we may hope for fewer mistakes than must needs occur if the homes and the societies had not been feeling their way, while as yet few are ready to take advantage of them. Where human beings are the material, that work is generally the most hopeful which is the most gradual and tentative. Failures are the bricks which build success.

M. D. SMEDLEY.

SOUTH AFRICA.

I.—MOUNTAIN—MEADOW—PLATEAU.

FAR up in the mountains of South Africa, where the peaks of the Drakensberg and the ridges of the Malutis attain their loftiest level, there lies a region but little known even to the people who dwell in its vicinity.

It is a land of jagged peaks and scarped precipices, of torrents and rocks, of secluded valleys, and great wind-swept hills. Snow rests for many months in the year upon its rugged hill-tops ; grass grows rank and green in its

many valleys. A thousand crystal streams flash over rocky ledge, and ripple through pebble-paved channels, and all the year round there is a sense of freshness in the air ; for the breeze that sweeps the land comes over peaks set ten thousand feet above the sea-line.

This in Africa—that land of heat and sun, of swamps and forest? Yes, even in Africa lies the region just pictured ; this Switzerland of South Africa, mountain Basutoland.

The clouds which the Indian Ocean sends to South Africa linger over this region of mountain peak, and shed their showers upon it through the months of summer; but in winter the skies are clear, the sun shines over the land, and the clouds which occasionally gather upon the peaks float away, leaving them clothed in dazzling snow, and seamed with ice-cruled cataracts.

Many rivers have their sources in this mountain region, and east, west, north, and south streams flow forth from it into a lower set land. Streams of small size and of large, streams which soon swell into mighty rivers, and become yellow and muddy as they roll towards far-separated oceans, forgetting the pure traditions of their birth among the snow-hills, in the turmoil of maturer life.

Looked at from its many sides, Basutoland presents always to the traveller a sight filled with a sense of freshness and of pleasure. From whatever point he regards it, he must ever look up to it, east or west, north or south, it first rises before him in the outline of a stupendous mountain, whose summits yield to the eye, long wearied of the leaden level of interminable plain, that cool draught which is fresh as water to a thirsty wanderer in a desert land.

But if from all sides it is grateful to the eye, from the east side it is something more; spread beneath it to the east lies a fair and fruitful land, a land whose highest level is fully four thousand feet lower down, and whose plains and hills lie outlaid at its feet, like a vast sea beneath a lofty shore.

This land of lower level is Natal: where Natal ends on the west, Basutoland begins on the east, and begins in a line so abrupt, so rugged, so scarped into precipice, and turret, and pinnacle, that it would seem as though nature had upraised a mighty wall of rock to mark for ever her line of separation between the mountain called Basutoland, and the meadow called Natal.

There are not many sights in South Africa which linger longer in the traveller's mind than that which can be seen almost every morning from the eastern ridge of Basutoland—the Drakensberg.

It is sunrise over Natal, up from the haze which hangs over the Indian sea—the haze which has turned to varying green, and gold, and crimson, as he drew nearer to the surface—comes the great blood-red sun, flashing on the rent pinnacles of the mountain wall while yet the region far below is wrapped in purple mist. No towns, no hamlets, no homesteads stud the vast plain beneath; but

scores of rivers wind through great grass-covered valleys, and from their unseen beds, long rifts of snow-white vapour float upward towards the growing light, and wreath themselves along the feet of hills and cling to kloof, and catch upon their upmost billows the light in which they are so soon to die. And as the light grows stronger, and the flying remnants of night prisoned at the base of the great cliffs, are killed by the shafts which the day flings into "krance" and cavern, there lies spread before the eye a vast succession of hill and valley, table-topped mountain, gleaming river—all green with grass—dew-freshened, and silent. This is Natal.

Far away, beyond all, a vague blank upon the horizon, the unseen sea is felt by the sight, where, at the furthest verge of vision, the Indian Ocean sleeps in space.

But there is another sight which the traveller sees just before night-fall, when from the meadow, called Natal, he looks up to the lofty ridge of Basutoland. The day has done its work; the sun has gone down behind the great western barrier; turret, dome, and rent mountain pinnacle, are clear cut in snow and purple against the green and saffron curtain of the sunset; the wall of rock is dark at its base, indistinct in its centre, sharp and lustrous along its serrated summit; the night gathers at its feet; the day lingers around its head; there is a shade of untold beauty in the sky, a green, such as one sometimes sees in Sevrès, and which I have never seen in sunset, save in Natal. The night deepens, and the light dies; but long after nightfall, that glorious light still lives in the western sky, and the unnumbered peaks, and jagged spires, and pinnacled turrets of the Drakensberg stand in lofty loneliness as though guarding the slow retreat of day into some far-off world.

This great range of the Drakensberg, called by the natives Kathalama, runs nearly north and south along the west frontier of Natal; but near the 29th parallel of south latitude, its direction changes suddenly from north to west, and culminates in a vast mountain mass, known as the Mont Aux Sources, from which many subsidiary ranges, and innumerable streams descend into the surrounding countries. If one can imagine a large letter A laid with its apex to the north, the right-hand arm would form the Drakensberg, the apex flattened out would be the Mont Aux Sources, and the left arm would be the Maluti range. Between the arms of the range are several minor ranges and clusters of mountain, a great sea of peaks; and from

the Mont Aux Sources, flowing from a labyrinth of cliff and cataract, springs the Orange river and its many tributaries.

Three other large rivers rise in this impenetrable fastness, the Wilge, or south fork of the Vaal, the Caledon, or north fork of the Orange, and the Tugela, the principal river of Natal. These many rivers flow from the Mont Aux Sources, south, east, north, and west; the Orange, as we have said, springing from between the arms of the letter A, the Drakensberg and the Malutis; the Caledon having its source outside the Maluti range, and between it and the lower range of the Rhode Berg; the Wilge river rising on the north face of the Mont Aux Sources, and flowing down into the Orange Free State to join the famous diamond Vaal; and the Tugela, which, also waking from the same bed, leaps suddenly from its cradle on the summit of the Mont Aux Sources down the perpendicular verge of the Drakensberg, as though, overjoyed to turn its steps to the fair region of Natal, it cared little for the three thousand feet of ledge that lay beneath it and that fair, green meadow. All these rivers carry to the Atlantic or Indian seas the tribute which the mountain monarchs send to the ocean from which they once rose.

So far for the rivers and the mountains of the land. Now for the people who have made their dwellings in this lofty region.

Many years ago, when the present century was in its cradle, a young Zulu warrior came riding from the south along the base of the Drakensberg. He held a northern course. He was accompanied, or rather carried, by an animal never before seen in the land; at times he appeared to the astonished eyes of the beholders as a portion of this animal, at other times he was separated from it.

The young Zulu was a long-banished exile returning to his home on the Tugela from a far southern land, the strange animal he bestrode was a horse, the first of its kind ever seen in these great wastes of South Africa; but he brought with him from the white man's home other and far greater secrets than the strange animal that carried him—he brought the idea of unity where there had been disunion, of discipline and combination where all had been petty tribal war and internecine confusion, of the strength which lies in organized numbers against the weakness of the individual. He had seen the regular soldiers of the white man, had caught in a vague way the outline of their organization, and now, as he sought, after a lapse of years, his Umtetwa people, it was

with the hope of moulding the scattered power of his tribe after the manner of the white soldiery in the infant colony to the south, and he succeeded.

His people received him as their chief. named him Dingiswayo, or "The Wanderer," and listened to his counsel and his plans.

Soon the youth of the Umtetwa were formed into bodies, fighting under distinct chiefs, and subject to the will of one man, Dingiswayo. This army of the Umtetwa was not a mere plaything in the hands of its chief, and ere a year had passed, the neighbouring tribes had felt the power of the new organization; small tribes became incorporated with or subject to the Umtetwa, and many restless spirits among the young men of the country beyond the Tugela joined the army of Dingiswayo, to push their fortunes in the new field which he had opened to them.

Among the adventurous spirits thus drawn to the service of the Wanderer, there was one of no ordinary genius. Chaka, the son of Senzangakona, chief of a small tributary tribe called Zulus, entered as a common soldier into one of the regiments of Dingiswayo. His bravery soon pointed him out for leadership; he learnt the lesson of organization and discipline even to greater effect than had his master; and when his time of chieftainship had come, a new power had dawned among the scattered tribes of South-Eastern Africa.

Some time about 1814, Chaka began his career of conquest. Everything went down before him. He changed the mode of fighting in the field—of movement in the campaign. To throw the assagai was forbidden: a shorter-handed weapon was instituted, and it was to be struck into the enemy, not cast at him from a distance. "Wait until you see the whites of the enemy's eyes, and then strike hard," was the order of the Zulu chief. His spirit was caught by his soldiers, and they closed with their enemies only to conquer.

An immense territory soon owned the dominion of the chief of the Zulus, but he conquered only to desolate and to kill. From the far Limpopo to the southern St. John, from the Indian Ocean to where men now dig diamonds by the swift-running Vaal—all that portion of Africa lay prostrate at Chaka's feet. The lower countries were a vast waste; famine, pestilence, and death had swept the land; and only in remote glen or wooded kloof, or impenetrable fastness, could be found a remnant of the desolated tribes.

It was in the year 1828 that the conqueror's career came to a close. He was assassinated by some of his own people at his kraal south of the lower Tugela. Seeing his end inevitable, he cried out to his murderers, "Ye think when I am gone that ye shall rule this land; but behind ye I see a white man coming from the south, and he and his shall be your masters."

As he spoke they struck him with their assagais, and the greatest conqueror of Zululand was no more. The scattered tribes that had been unable to oppose the Zulu chief had withdrawn into remote countries. One powerful band, attacked in the open country, had retreated along the Vaal, and by the fastnesses of the Drakensberg, into what is now called Basutoland. They were without cohesion. A dozen chiefs claimed their obedience, and it was only the rugged land and the natural defences of their new home which enabled them to preserve even a shadow of their power.

About the time of Chaka's death there arose, in this Basuto nation, a man differing in every respect from the Zulu conqueror. He was a shrewd observer, apt in council, held peculiar views about the white man's dominion, and had more faith in the power of the tongue than in that of the assagai; yet he was a brave and skilful soldier. The name of this man was Moshesh. From a petty chief he soon became a powerful leader, and ten years after the death of Chaka he was the acknowledged paramount of all Basutoland, and had moulded together into one nation all the tribes which dwelt around the Mont aux Sources, and along the upper waters of the Caledon.

At the period we speak of, this region of Basutoland, the great level now called the Orange Free State, and the meadow of Natal were all unknown to the white man. A few travellers or hunters had penetrated north of the Orange River, but the great mountain fastness had resisted all attempts to pierce its mysteries; and nothing of Natal, save its half-tropic shore-line, was known to the outside world. A vast unmeasured solitude was this land beyond all the Orange River. From the rising of the sun until its going down, the traveller beheld an endless plain. At times a flat-topped hill rose abruptly from the level; loose rocks of sand or trap cumbered the base; the sides were scarped, or steep and overhanging near the summit; and upon the top a perfectly level table surface was cut clearly against the sky line. Perchance

the hillside held a straggling growth of bush. For the rest—hill and level, plain and precipice—were clothed in a short green grass in summer, a dry brick-coloured clay in winter, but at all times it was a land of life.

Across the endless plain, upon the table-topped hill, in the dry dust-coloured valley, there moved and grazed and galloped innumerable herds of wild animals. Springbok and blessingbok, wilderbeeste and hartebeeste, eland and quagga, roamed in countless numbers, and the traveller saw when the sun shone over the land the light reflected upon the glistening sides or striped foreheads of tens of thousands of graceful antelopes, careering in circles round the track, or stopping in their prancing gallop to gaze in wonder at the stranger's presence.

But at length the great wastes north of Orange River began to know a change.

About forty years ago there came in long succession from the south a vast troop of waggons; men rode on horseback by the waggons; twenty coupled oxen drew each ponderous load; there were fully nine hundred waggons, and across the dusty plains crept the monstrous cavalcade.

It passed slowly on. Some tarried here, some there, others wandered on further into the wilds.

There is a tall mountain which stands out by itself in this great plain. It is rugged and lofty, and can be seen from a great distance; fifty miles away it still seems near at hand. It is called Tha-banchu, or the Hill of Night. Near this dark hill many of the new-comers halted. They were white men, who had long dwelt in the regions to the south, and they now sought this northern waste, not because their own lands were becoming over peopled, or because fresh arrivals pressed them from without; but from a restless longing to escape from law and civilised restraint, and to establish themselves in a kind of patriarchal freedom in the remote interior. They had but a faint idea of the geography of the earth, and not a few among them looked upon this migration as a counterpart to the exodus of the Israelites of old, and had some dim expectation of finding a promised land beyond the deserts of the treeless Karoo.

Some halted within sight of the Hill of Night, others pressed on to the north and east. Moshesh held many parleys with them as their slow lumbering waggons jolted along the plains of what is to-day the Orange Free State; but he did nothing to oppose their progress, and they passed along his rugged

frontier to where the ridge of the Drakensberg breaks down from the Mont Aux Sources, and a gradual decline leads into the pastures of Natal.

They reached the ridge, and looked down upon the fair land below. It was a sight which woke even in the dull nature of the Dutch onlooker a sense of enthusiasm. Here was their promised land, here was their possession. Slowly the long cavalcade wound down the steep descent, and took possession of Natal.

Moshesh had built his kraal at the base, and upon the summit of one of these innumerable flat-topped hills called Table Mountains of Basutoland; the hill was named Thaba Bossiou, or the dark mountain. It stood some six miles from the Caledon river. Twenty miles to the east, the great range of the Malutis rose in dark blue masses, around them lay a perfect network of table mountains, deep winding valleys, abrupt sandstone precipices, and every variety of intermixed hill and kloof, vale and ridge.

Moshesh's name had widened out over a broad area of fame; many tribes of Griquas, Amonquanis, and Zulus had tried the strength of the Basuto nation, and felt the power of the crafty chief who dwelt in Thaba Bossiou. Once, a large horde of Griquas (Dutch half-breeds), attacked the mountain kraal under a certain Hendrick Hendricks, and of his doughty followers not one escaped. Again, Palarita led the Amathlubi tribe into Basutoland, and left his bones and theirs to whiten the hills of the Caledon.

But Moshesh was crafty in his victories. He kept to his mountain fastnesses; repelled all attacks upon his territory, and took counsel from a few foreign missionaries who had sought his country.

Time went on. The Dutch were not to have quiet possession of Natal. Chaka was long dead; but a tyrant almost as cruel, though with but half his cleverness, reigned in his stead.

At the base of the Drakensberg, amidst the kloofs and glens of the upper Tugela and its tributaries, there dwelt a chief named Sikkunellya. This chief had made a foray into Zulu-land, and carried off cattle from the people of Dingaan, the murderer and successor of Chaka. The Dutch restored the captured cattle to the Zulu chief, and asked in return for a cession of Natal. The request was acceded to. It is easy to give away that which is not ours, and all Natal was given by the tyrant's murderer to the

new-comers—all Natal from the Tugela to the Umzimkulu, from the Drakensberg to the Indian sea.

At the king's kraal by Umkinglové this cession was made. Dingaan placed his sign manual to the document, and the Dutch leaders Maritz and Retief affixed their signatures in due form. It may be presumed that this latter operation was one of no little difficulty to the Dutch commanders; for to these modern Israelites a pen was a stranger weapon than a gun; but somehow or other the names were affixed and the Dutch commanders prepared to withdraw.

At evening there arose a great uproar in the camp; there was a cry of treason through the Dutch Laager; thousands of naked Zulus crowded among the waggons; there were random shots and fierce shouts, and much stabbing and glint of assagais, and when daylight dawned again, Retief and his comrades all lay weltering in their blood.

It would be long to tell of the scenes that followed; how the Zulus swept down into Natal upon the scattered Laagers of the Dutch by the swift-running Tugela, and the Bushman Rivers; how these brave savages rushed the Laager by the Bushman river drift, and carried such destruction through the camps, that to-day an immense tract of country bears the name of "Weenan," or the place of weeping; and then, how the Dutchmen rallied and bore back the savage tribe, and in a great battle by the Blood river, destroyed the king's kraal, and broke for ever the power of the Zulu tribe.

But while all this wild work went on in the lower country, along the base of the Drakensberg, up aloft in Basutoland the crafty chief Moshesh held quiet possession of his glens and table-topped ridges. Five years earlier, a small group of white men from a distant country had come to Basutoland. They came to teach, not to fight; they were French missionaries. Moshesh received them with favour. He gave them land in many parts of the country. Hard by his own stronghold of Thaba Bossiou, they built a mission station of great beauty: it was in a valley between two steep rugged table hills; a stream ran below it; great cliffs of basaltic rock stood like sentinels around it, and in spring, the scent of almond blossoms filled the air, and the thatched eaves were white with jessamine flowers.

But Moshesh, though he encouraged the missionaries, and counselled his people to attend their teaching, did not himself adopt their faith. "He was too old to change;

the young people might learn ; but for him it would not do." So has it been in these times of ours all the world over, the days have passed when savage kings and chiefs adopt the cross at the teaching of the missionary, and with Xavier, that power which penetrated the hearts of peoples, and changed kings and nations, seems to have vanished from the earth.

But though Moshesh took small heed of

the teachings of the Frenchmen in spiritual matters, in temporal ones he gave full attention to them. Beware of war ; resist when attacked ; make friends with the white man ;—these were the chief tenets of the worldly creed they taught him, and under such teaching Moshesh grew in power, and Basutoland became rich and prosperous.

But a great danger soon began to menace Basutoland. The wave of the white man's

Moshesh.

domination was beginning to surge against the mountain fastness of the Mont aux Sources. South Africa had not a white population equal to a third-rate English town ; nevertheless, an area as large as Germany was found too small to hold these fifty thousand white men, and the thin but restless stream was already beating against the remote regions of the Malutis, and flowing away to the mighty wilderness where the

Vaal washed from its gravelly shores in summer floods the yet-unknown shining stones called diamonds.

To build empires out of her colonies ; to make Greater Britains in the vast wastes of America, in the great uplands of South Africa, or in the island continents of the southern hemisphere, seems a dream that for ages never dawned upon the British mind. Why should it? Our statesmen were not intent on building

empire anywhere—even at home. To make it “last our time” was policy sufficiently far-seeing for the wisest among them; and as for the wastes, well, there were buffaloes there, and wildebeestes, and kangaroos, and there they might stay until the day of judgment.

It was a fanciful picture that of the New-Zealander, and the broken bridge, the crumbling dome, the silent city; but for all that there is not to-day a wanderer who has ever roamed through the new lands of the earth who has not seen full many times repeated the drearier spectacle of possession—born to us in earlier times out of the throes of fight and fierce contention over sea and land—abandoned into other hands, or let crumble from us in a heedless apathy more irritating than defeat.

But to Basutoland.

The Dutch Boers who had crossed the Orange River proceeded to establish themselves as an independent community among the wildebeestes and the blessboks; there were no Englishmen in that part of the world, and the establishment of a Dutch republic met with no opposition at our hands. Those of the Dutch, however, who crossed the Berg, and went down into Natal, met with different treatment.

Far away by the Indian Sea, at the port of Natal, a small English settlement had taken root. After defeating the Zulu king and destroying his kraal in the upper country, the Dutch adventurers had drawn nearer to the sea—to Araby or Jerusalem or the Jordan, as they fondly imagined. All at once they found themselves face to face with the English settlement. “Curse these Englishmen!” doubtless cried the Boers; “here they are safely settled in Jerusalem before us.” Still, there was peace between the rival settlers for a time, and, in the face of the common enemy, war would have been dangerous.

But after the victory over the Zulus things changed. The Dutch attacked the English settlement, and for a time had matters their own way. Beaten by superior numbers, the English commander shut himself up in a hastily-built fort, composed verses to the Southern Cross, and bid defiance to the Boers. Months passed away; help came to the British camp from Cape Colony; the Dutch were beaten back; they moved into the upper country again, and more than half their number recrossed the Berg to seek for Araby in other lands. Natal was English; but by a fatal error the line of British boundary stopped at the Drakensberg; no

claim was made to the great plains north of the Orange River—no claim, at least, for six years after.

In 1847 a man was appointed to the governorship of Cape Colony who, whatever might be his other qualities, knew the true policy of England in the wilds. There were to be no boundaries to English possession in South Africa, save such as ocean set. Boers might migrate here or there; but whenever the time should come that English civilisation reached the confines of the country in which they had settled, then, too, had come the time for the establishment of British dominion in that land; whether Boer, or Basuto, or Bosjisman reigned or roamed in it. South Africa was British by every right of conquest and privilege of possession. The Dutch, dissatisfied with our abolition of slavery, might “trek” where they pleased; but they must still remain British subjects, by the self-same law which made the Mormons citizens of the United States, after they had placed sixteen hundred miles of wilderness between them and the last outpost of Yankeedom.

In 1847, there arrived at the Cape of Good Hope a new Governor; he had been a dashing leader of dashing men. British power, as represented by a few squadrons of British cavalry, was in his eyes irresistible. Dutch Boers setting up a republic of their own beyond the Orange River—the thing was absurd to the last degree. “Forward the Cape Corps. March away the Rifle Brigade. We’ll soon see who is to be the ruler in South Africa.”

So across the wilds of the Karoo, and up to the banks of the Orange River, went a small force of regular troops. Some little distance north of the river, a “Commando” of Boers had taken its post amidst rocks and stone-covered hills nigh a place called Boomplatz.

The victor of Aliwal, brave to rashness, rides forward in advance of the little army. Shots ring out from the rocks, a few of the staff fall, an escort of Cape-mounted men run away; but the brave old chief reins in his charger where he is, and cursing the run-aways, calls out to the Rifles to advance. They come up at the double, spread out into the hills, and move straight up against the rocks. Suddenly the puffs of smoke cease. “This is not a proper way to fight,” say the Boers; “we came prepared to lie here quietly for a few hours among the rocks, and here these fellows come running up to us as if they were our friends.”

So in order to escape being shaken by the

hand, or perhaps by the throat, the Dutchmen scramble into their saddles in yonder hollow, midst the hills, and gallop away to northern wilds, their brave leader, one Prætorius by name, never drawing rein until sixty miles lay between him and the Boomplatz.

The Orange Republic was no more. Moshesh heard with joy, up in his mountain, the tidings of Boomplatz, and he marched out from the hills, with his army, to greet the English Governor, and to show his respect for the Queen's authority.

They met at Winburg. It was a novel sight. The Basuto army numbered above five thousand men, mostly mounted on shaggy or wiry ponies. Sir Harry Smith was in high spirits. "Moshesh was his friend and brother," he said. "The Basutos and the English would ever be friends."

The English general called out in his deep voice, whether there was any trooper in the ranks who could perform the sword-exercise in front of the line, for the edification of the Basutos. A trooper rode out and began to cut and thrust about his horse's ears. Sir Harry waved him back with a gesture of disdain. Another essayed the feat; again the old general cried out, "that was not the sword-exercise."

At last, an Irish soldier rode to the front, he cut and thrust, and whirled and slashed, and jerked about in his saddle in such a frantic manner, that the Basutos roared with delight, and Sir Harry Smith declared his satisfaction. Then came some cavalry manoeuvres, and finally the review was over.

It was now Moshesh's turn. He attempted a charge; but a great part of his cavalry was suddenly transformed into infantry by the simple process of being sent flying over its horse's head. The horse was still a newcomer in Basutoland, and the monkey-like seat which now cannot be shaken, had not then been attained.

A war dance wound up the day. The whole Basuto army danced like demons, Moshesh capering at their head. At one period the excitement became so intense that it is said the old general caught the infection, and, seizing Moshesh in his arms, danced round and round with him.

Moshesh went back to his mountains. The English Governor pursued his way to the Drakensberg. On the ridge overlooking Natal he met the Boers in council. They were flying with their flocks and herds from Natal, to escape from the British Government once more: Araby and the Promised Land were to be sought somewhere else.

It would have been better for Natal if the English Governor had allowed the Boers to seek fresh fields and pastures new.

To make the earth a waste and to call it a farm is the first rule of Dutch agricultural practice in South Africa. Six thousand acres are still known as "a small farm"—no fence, no tree, no shrub, no sign of agriculture breaks the terrible monotony of an up-country Dutch holding: far as eye can reach there is but a wilderness unmarked by man.

In the council on the top of the Drakensberg, Sir Harry Smith offered to the flying Dutchmen the most liberal grants of land in Natal. In many cases these grants were accepted, the Boers resumed their former places; the system of vast farms became perpetuated in a country whose conditions of soil and climate were in perfect keeping with a system of small agricultural holdings, and the opportunity was for ever lost of planting on the African continent the germs of the only European settlement which can ever ripen into a prosperous civilisation.

Time went on. A new governor was sent to the Cape; war, fierce war, had broken out among the Kaffir tribes of the Kei river. Moshesh kept to his mountains; but ever and anon the Boers, who had settled in the plains, cut off some slice of Basuto territory, run the swerving lines of farms further towards the Caledon, and set up beacons nearer to the Blue Malutis.

Then there came raids upon cattle, horses disappeared from the farms: the Basuto said it was but fair retaliation; the Boers called it unprovoked robbery.

Following the affair of Boomplatz came the establishment of British government north of the Orange River. An English resident dwelt at Bloemfontein, a small garrison occupied the fort. The resident took the views of the farmers, got together some tribes of Barralong and Bechuans, and moved against Moshesh. The Bechuans and Barralong made a poor fight: Moshesh was the victor, but he knew better than to push his advantage against the British.

Towards the middle of 1852 the war on the Kei was over, and the English Governor, Sir George Cathcart, bethought him of a new move. He ordered the assembly of a Field Force on the Orange River in the month of November of that year, and, crossing the river early in December, moved along the right bank of the Caledon. He had with him the finest force ever seen in South Africa—a regiment of lancers, a battery of artillery, and four regiments of light infantry.

About mid-December the little army reached Plattberg, on the Caledon; a few miles across the river lay the mountain fastnesses of Thaba Bossiou, and from the ridge of Plattberg could be seen the hills and rocks of Basutoland stretching from the river side to the Malutis.

On the 19th of December Moshesh came to the English camp in considerable alarm. The interview between him and the British commander was a curious one. Cathcart demanded ten thousand head of cattle, and a large number of horses as a fine for the misdeeds of the Basutos. Moshesh expostulated, declared the number was out of all reason, begged for time, spoke parable after parable, dealt in metaphor by the hour; but all to little purpose. "Peace is like the rain that makes the grass grow," he said, "war is the hot wind that burns it up."

At last, finding neither metaphor nor entreaty of any avail to prevent the lessening of the fine imposed upon him, he asked the General what would happen if the whole number were not forthcoming on the third day. "In that case I will go and take them," was the reply. "War is bad," answered Moshesh; "but even a beaten dog will bite." Then he went back to his mountain.

The 20th of December came. At day-break the army moved from its camp at Plattburg, crossed the flooded Caledon on pontoons, and held its way towards Thaba Bossiou. It was a dull overcast morning: now and again the vapour broke into rifts, and between them could be seen the steep sides of cliffs hanging abruptly over winding valleys, and at times perched on some craggy point, a Basuto scout was visible keenly watching from his shaggy pony the moving column beneath; all else was quiet.

From the centre of the valley through which the column marched a large hill rose abruptly before the troops, and stood like a great island in a stream, the valley separating at its base and throwing out arms on either side. The hill that rose between these branching valleys was high and table-topped; its sides, scarped into perpendicular "krances" near the summit, sloped down at a steep angle near the base, where lay piled together a *debris* of crag and boulder, long since ruined and shattered from the rock-frontlet above.

The hill was called the Berea. At the spot where the gorge or valley divided into branches, Cathcart divided his little army too. The Lancers followed the valley to the left; the Infantry took the hill of the

Berea in front; the Artillery, the general and his staff, and half a battalion of foot kept along the valley to the right.

It was a strange disposal of the little army. The valleys along which the wings moved, diverged further and further apart—mist, fog, crag, and precipice intercepted the view; nothing could be seen of the table-topped hill save its scarped sides and rugged "krances;" troops in the valley could render no assistance to troops on the hill; nor was it possible to communicate from one valley to another except by a long circle round the base of the Berea. It is difficult to climb these table mountains, but it is ten times more difficult to come down them again; for the rugged path which zig-zags through the cliffs can be traced from beneath, but is altogether lost from above.

On the summit of the Berea hill Moshesh had collected together a vast number of cattle and horses, these the cavalry had orders to capture. Through a rough and broken incline which wound through rocks and shingle, the Lancers reached the top of the Berea. On all sides there spread around them a level expanse of sward, upon which Basutos galloped to and fro endeavouring to urge to greater haste huge droves of cattle. The Lancers rode in among the cattle; the Basutos fled into the fog. For a time all went well; but the work of cattle driving was not a military manœuvre much in practice among the cavalry, and the troopers riding to and fro soon became detached into broken parties of a few men lost in a maze or terrified animals.

All at once through the fog there came a dense mass of Basutos riding down upon the scattered troopers. The cattle broke in every direction—in vain the Lancers tried to rally; from rock and crevice, from the sharp edge of the precipice where the flat-topped hill dipped all at once out of sight, the shaggy ponies and their naked riders came sweeping through the wreaths of mist—the right, the left, the north, and the south had all become to the English soldier a hopeless puzzle; some fought singly against many foes; others, endeavouring to reach the main body, became only further separated from it; others, pent between their enemies and the wall-like precipice edge, boldly charged into the Basutos. In a few moments a score of the finest cavalry in the world had been killed, their horses taken, their gay trappings torn off, and then was there seen the singular sight of these monkey-like negroes, arrayed in scarlet coat and leather over-all, flourish-

ing bright-pennoned lances aloft as they galloped hither and thither over the table-land of the Berea hill.

While this wretched scene was being enacted on the left, the centre column of infantry pushed its way up the precipice and gained a footing on the summit. A mounted staff-officer was with them. Riding some distance in advance of the front of the column, he thought he discerned in the fog the helmets and pennons of the Lancers. Galloping up to them, he suddenly found himself surrounded by Basutos dressed in cavalry uniform. Faunée is said to have surrendered his sword, and asked for a few minutes' grace before his death. Some hesitation appears to have been felt by the Basutos at the final moment. There were those among the savages who would have spared the life of the prisoner; but while some clamoured for his life and others sought to preserve it, news came that the white soldiers had killed Basuto women at the base of the Berea hill, and these tidings decided the captive's fate. He was killed on the spot.

The day wore to a close. Cathcart spent many an anxious moment. Dark clouds of Basuto horsemen hovered around the English army. At length the infantry descended from the hill; the clouds of horsemen seemed to increase. For a moment, it is said, the English general deemed himself lost. "Let us die like English soldiers," he exclaimed to some of his staff.

"Die!" exclaimed the fiery-spirited Eyre, who had just arrived, maddened by the result of the day. "Give me leave, sir, and I will soon answer for this black rabble."

But night was already closing; and as the daylight darkened over Thaba Bossiou, the Basutos drew off into the mountains.

Next morning Cathcart withdrew his forces to his original camp on the Caledon. The troops were wild to avenge the disasters of the Berea. Such an army foiled by such a foe! They must advance again and storm Thaba Bossiou. But ere the morning wore away, messengers came from Moshesh. That crafty chief knew well what would be the result of his transient victory. His soldiers might deck themselves with the Lancer trophies, but the triumph would be short-lived if he did not at once make peace; so, with many protestations of submission, the old chief offered cattle and horses to the General he had beaten but the previous day, and besought the clemency and forbearance of the vanquished.

It was a sagacious move. Moshesh blazoned forth his triumph far and near to Kaffir, Zulu, and Bechuana; for many a day the Lancers' pennons flew gaily above some Basuto kraal, tokens of Basuto victory, over the white man. But by his crafty submission Moshesh saved his kingdom from destruction, and if to-day there is a native state called Basutoland in South Africa, it is because the old chief knew how to build a bridge for a baffled foe, and to pay him handsomely for crossing it.

This battle on the Berea hill was fought in December, 1852. Ere a second December had passed, the old English general had fallen on a far-off Crimean field, and the hill named "Cathcart's," in memory of him, was furrowed deep with the graves of England's bravest sons who had died "like English soldiers."

W. F. BUTLER.

THE MOUNTAIN WALK.

By PRINCIPAL SHAIRP, LL.D.

PART I.

FROM beaten paths and common tasks re-
prieved,

My face I set towards the lonely grounds
Where Moidart and Lochaber, northward heaved,
Meet with rough Knoydart bounds. :

And with me went an aged man on whom
Still lightly hung his threescore years and ten,
Intent to see once more before the tomb
His long-unpeopled glen.

O'er 'Faeth,' 'Maam,' 'Gual,' each shape of moun-
tain-pass,

From morn to eve, an autumn day we clomb
A lone waste wilderness where no man was,
Nor any human home,

And looked o'er mountain backs, misty or bared,
Ridged multitudinous to the northern bourn,
Where, high o'er all, the great scours watch and
guard
Loch Nevish and Lochourn,

Saw far to west through yawning gaps upleap
 Dark Moidart mountains with their clov'n defiles,
 And here and there let in the great blue deep,
 With the far outer Isles.

While close beneath our feet clear streams were
 flowing
 Down dark glens walled steep sombre hills
 between,
 But lit with streaks of grassy margin glowing
 Bright with resplendent sheen.

And by the stream's grass-mounds and grey-mossed
 heaps
 Lay, once the homes where thriving men had been,
 And far up corries, where the white burn leaps,
 Where pleasant airidhs * green.

But no smoke rose from any old abode;
 From the green summer shealings came no song,
 No face of man looked on us where we trode,
 From dawn to gloamin long.

Only high up hoarse-barking raven's croak
 Knelled on the iron crags, or glead's wild screams,
 And down the awful precipices broke
 The everlasting streams;

The while the old man told how times remote
 Had named the balloch from some famous man,
 Slain in old battle when the Camerons smote
 Their foes of Chattan clan;

Or on 'the squally shoulder' he would pause,
 And, pointing to grey stones, would whisper,
 'Here
 The mourners builded Evan's cairn, because
 They rested with his bier

'On the long journey from his native glen,
 Down to his last home by the sea-loch side;'
 And, 'There by night and weariness o'erta'en,
 Long since a shepherd died.'

And then more lightly, 'O'er these very knowes
 I ran the browse upon my wedding-day
 With other lads to win my young bride's house,
 Now fifty years away.'

Late in the afternoon my steps he stayed
 On a high mountain pass, and bade me look,
 Where the burn, plunging from the height, had made
 One small and sheltered nook;

'Beneath that bank we rested us at eve,
 The first day's weary journey ended, when
 Full sixty years since we were forced to leave
 For ever our dear glen.

* Shealing-pastures.

'A day it was of lamentation sore,
 As we set face against the steep ascent,
 Slowly the lowing cattle moved before,
 Behind we weeping went.

'And well we might; the old folk from that
 day
 Found never home like that they had resigned;
 And we—thenceforth our happy childhood lay
 In that far glen behind.'

And so with talk like this the day wore on,
 No rock unnamed, no cairn without its tale,
 Till, from the western scours the last gleams gone,
 To the deep-shadowed vale

Down through Leačna-vaata slow we passed,
 'The hollow of the wolf,' so named of old,
 Since hunters there o'ertook and slew the last
 Grim spoiler of the fold.

There where Loch Aragat hath his utmost bound,
 And from the western glens the waters meet,
 Beneath the kindly shepherd's roof we found
 Welcome, and warm retreat.

PART II.

All night enfolded in the lap of Bens,
 Around our sleep the loud and lulling sound
 Of many waters meeting from the glens
 Made lullaby profound.

Next day the westering morn our guide we make,
 Where a strong stream in jambs of granite pent,
 From pool to pool, down-plunging to the lake,
 Hath grooved itself a vent.

That strait throat passed, back falls the mountain's
 bound,
 Before us there out-spread in silence, lay,
 With loop on loop of river interwound,
 Long, green Glen Dessaray.

A long, flat, meadowy strath of natural grass,
 Where calm, from side to side, the river flows,
 After the turmoil of yon splintered pass,
 Loitering in slow repose.

Each side steep mountain-flanks wall the green
 flat,
 To west the long glen closes, grimly barred
 By the stern-precipiced shelves of Scour-na-naat
 And by dark Maam-clach-ard.

There as we stood on the mute glen to gaze
 The old man pointed to the hillocks green,
 Where, either side the strath, in former days,
 The Clansmen's homes had been;

Homes that had reared the Camerons, who in
old
Centuries of ceaseless battle, true and leal,
Against Clan Chattan had been brave to hold
His country for Lochail;

Who, in the latest rising of the clans,
For King and Chieft, devoted hearts and pure,
Had led the crashing charge at Prtston-pans,
Died on Culloden moor.

For all those homesteads only here and there
A gaunt, grey, weathered gable—for the hum
Of many human voices, on the air
Blank, awful silence dumb.

Only the hill-burns down the corries broke,
Only one horn harsh-screaming from the fen,
And but one shepherd's solitary smoke,
Far in the upper glen.

Then, one by one, the old man, sad in heart,
Pointed the stances, where in childhood time
From four blithe farm-towns, each a mile apart,
He had seen the blue smoke climb.

Two on the north side, dry on ferny knowes,
The noonday sun had welcomed with frank
look,
The southern two, withdrawn 'neath high-hill
brows,
Each cower'd in bielded nook.

Then closer drawing 'neath rank weeds he showed
The larachs * of the homes, wall, hearth and
floor,
Where in each town large brotherhoods abode,
Twelve families and more.

And as he traced each home, the names he
told
Of men and women who there once had been,
How lived and died they in wild days of old,
What weirdly sights had seen.

And last he led me to his own farm-town,
Even to his father's home—there lay the hearth
Grey-lichened, walls around it crumbled down,
Till all but blent with earth.

'There yawned the window to the crag behind,
Through which my grandsire gallant burst away;
When two red-coats, who had him in the wind,
After Culloden day,

The threshold crossed to seize him; fleet of foot,
He took the crag—they fired and missed their
aim,
Then, throwing down their guns, in hot pursuit,
Fast on his track they came.

He slackened his speed, and let the foremost near,
Then heaved a slag of rock, and laid him low;
The chase was over—he left free from fear,
Forth to the hills to go.

And then, with lowered voice and deepened feel-
ing,
Pointing one spot upon the floor, he said,
'Here on these very stones we bairns were kneel-
ing,
And there my father prayed,

'One stormy Sabbath-night, when wild winds
hurried
A loosened snow-heap from the crag, and o'er
The rigging rolled it clean, and deeply buried
The house, and blocked the door

'With a great boulder.' These and many more
Tales through the glen beguiled us west away
O'er Maam-clach-ard to dark Loch Nevish's shore
Down with declining day,

There, 'neath a roof, where people of the old kind
Still keep the ancient faith, through the deep
calm,
All night we heard the cataracts behind
Down-thundering from the Maam;

The while they told how oft when no wind stirred,
Unearthly sounds the mountain stillness rent
At midnight, by belated travellers heard,
As through the Maam they went;

And apparitions when the spirit fled,
Crossing the gaze of melancholy seers,
And trystings where the living met the dead
By lonely mountain meres;

All the weird, visionary lore that lives
Still by the dim lochs of the western sea,
And to that region and its people gives
Strange eerie glamourie.

Next morn we clomb the Maam with eastward
foot,
And walked the higher ranges of the glen,
Looked on green summer shealings, long left
mute
By old Glen-Desseray men.

* Foundations.

One last look back—there lay the glen inlaid
 Deep in its walling hills—a meadowy strath,
 Through which in loop on loop the river strayed,
 A slowly-winding path.

And all the west, jagg'd precipices riven
 With gorge and gully and ravine black-gloomed,
 Closed in—above them in the twilight heaven
 The great peaks ghostly loomed.

All these days, as we wandered, morn to eve,
 The old man, piece by piece, the tale unrolled,
 How once the Cameron clansmen wont to live
 Within these glens of old.

Things too his grandsire and his sire had seen,
 After Culloden, till the ruthless time
 That swept the glens of all their people clean,
 Things mute, in prose or rhyme.

J. C. SHAIRP.

GOTHIC ARCHITECTURE.

THE influence of the Gothic style has been so marked on our English architecture generally that it may not be out of place to devote a few pages of GOOD WORDS to an explanation of its development. This will turn out to be the shortest way of explaining its principles, and enabling us to judge how far it is suited for modern domestic requirements.

Although England and France developed each their own forms of Gothic architecture,—similar advances being made independently in both countries about the same time, as is the case at present in astronomy and other sciences,—the style was imported into England already somewhat advanced. Its first appearance was in France, and there, from the more logical character of the people, less tolerant of compromise than we are, its development can best be traced. It sprang from an imitation of the buildings which the Romans during several centuries of occupation, with their faculty of giving their conquered provinces not only their language but their manners, had left everywhere throughout Gaul, in their own round-arched style, palaces, baths, aqueducts, bridges, basilicas, and villas or country houses like villages, consisting of straggling agglomerations of buildings one story high connected by covered colonnades for country residence and the cultivation of the soil. After a century or two of pillaging excursions the German barbarians settled in the land. About the middle of the sixth century the Franks had occupied the whole country except part of Languedoc held by the Visigoths, the east held by the Burgundians, and Brittany, which was not conquered. By these conquests they lost the social organization they had brought with them. Ceasing to be a conquering army under a single head, the habit which Cæsar and Tacitus had observed in their

ancestors arose again among them, each tribe dwelling apart, isolated from its neighbours by tracts of waste land. Military chiefs became landed proprietors,—heads of little independent sovereignties uncontrolled by the central power. Their companions in arms, almost their equals before, were now their dependents. With their love of plunder and fighting, when there were no more villages and towns to pillage, they took to fighting among themselves, and it was some centuries before even the rude national unity of feudalism became a fact as well as an idea.

In this anarchy the monasteries were the only refuge of civilisation, preserving some traditions of Roman art and order, organizing needful trades into guilds, a system afterwards adopted in the towns when, in the beginning of the tenth century, they began to recover their freedom.

When with rising civilisation churches or monasteries and towns began to be built, architecture had to begin at the beginning again. Roman buildings remained everywhere, but no one knew how they had been constructed. These in their new buildings the people copied as well as they could, making up for miserable construction by lining them inside with marble and gaudy painting.

When they began to build churches they attempted a reproduction of the old basilicas, or halls for the administration of justice (as had been already done in Italy), the form of which churches still retain, a large central nave or vessel, with an aisle or passage along each side, half the width and height of the nave, opening into it through a range of pillars supporting round arches, above which was a range of windows called a clerestory, lighting the central nave. At first, as they were unable from poverty and want of skill

to reproduce the Roman vaulting, the roofs were wooden. But churches in those days, like theatres now, were always being burnt, and attempts were made to make the roofs as well as walls of incombustible material. In the south of France this was attempted—without the use of wood—by a plain waggon vault, as it is called, from being like the cover of a long waggon stretched on half hoops. This vault they covered with solid masonry in the ordinary form of a roof (Fig. 1). But for this a round arch was very unsuitable; a

Fig. 1.

Fig. 2.

pointed one saved weight on the apex and had less thrust (Fig. 2). And, wherever they got the idea, whether out of their own heads, which is not impossible, or through Venice from the East, where the pointed arch seems to have been used continually since the time of the Pyramids and Nineveh, it was for vaulting almost immediately adopted. But the arches opening between nave and aisles and those of the windows were still round.

In another way the pointed arch was found advantageous in construction. Attempts, again from a desire for fireproof construction, were made to build domes. Gothic had once a chance of becoming a domical style of architecture. If a square is supported on four arches, and carries a dome (Fig. 3, plan), the bottom of the dome being quite inside the angle pillars, must be supported from them by four spherical triangles (*a a* Figs. 3, 4, and 5) whose points rest each

Fig. 4.

Fig. 3, plan.

Fig. 5.

on one of the pillars, and whose bases, turned uppermost, form together the lowest ring of the dome. These triangles resting on their points, their tops a quarter of a circle, their sides each half of one of the supporting arches, are called pendentives, from their hanging as it were in the air. Now if the arches whose curves their

sides follow are pointed (Fig. 5), the pendentive will be longer than if the arches were round, and, the projection being the same, will not slope so steeply forward; while, if the arches are round, the top part of these pendentives must project actually level, and thin away to nothing. Consequently a dome is more easily placed on pointed arches than on round.

Neither of these styles of Gothic was ever developed. In them the windows and openings always remained round. The domical style with the means at the command of the builders was suited only for small churches, and could not serve the needs of the great towns of the north. The style with waggon vaults was suited only for the south, for churches so constructed were difficult to light. To form an abutment for the massive central vault the lower side aisles had to be carried up to its springing, thus abolishing the clerestory and preventing any light getting into the central nave except from the side aisles, leaving the central vaults dark caverns (Fig. 6). Then the roofs

Fig. 6.

all stone did not do. Water got through their upper surface, as will happen, and filtered through the solid roof in devious courses. The place where it appeared on the inside was no indication of the position of the leak outside; so that it was found necessary, especially when the vaulting became more intricate in form, to make it merely an inner ceiling, protected outside by a simple wooden-framed roof.

Gothic, as we know it, developed in the north of France, in what was called the Royal Domain, comprising Paris, Rheims, Amiens, &c.* At first, their churches being

* Viollet-le-Duc, *Dictionnaire de l'Architecture Française du XI^e au XVI^e siècle*, Paris, 1854, which gives an admirable account of the history and meaning of Gothic architecture.

large, the builders confined their fireproof constructions to the side-aisles, for they were unable to vault over the wider central portion; nor could they afford to lose the range of windows, or clerestory, as it is called, which lighted this central part, by raising the side-aisles so as to make them abutments to a waggon vault. For this difficulty they found in Roman work a solution which enabled them to vault the central nave and yet preserve the clerestory. By dividing the continuous waggon vault of the nave into square compartments, and running another vault across each compartment, so that the two vaults intersected, as the Romans had done, they concentrated the thrust on the four angles of the compartment, where it was abutted, at first ineffectually by tall buttresses, but with larger experience completely, being carried down to the ground by half an arch above the aisle roofs, to which is given the name of flying buttress. At the same time an arched space was left clear in each compartment of the nave above the aisle roof in which windows could be opened. These improvements are shown in Fig. 7.

Fig. 7.

This form of vaulting is called groining, in contradistinction to the continuous waggon vault, as the masses of the vault are divided and joined at a point like the limbs to the trunk in the human groin.

This system of vaulting it was easy to apply either to the nave, leaving the aisles with wooden roofs, or to the aisles only with wooden roofed nave; but to vault both at the same time, using only the Roman round arch, was a problem of some difficulty. For, if the width of the nave was taken as the size of the square of vaulting, the vaults of the narrower aisles, springing from the piers of the wider nave, become oblong in plan, the arches across the aisles only half the size of those

into the nave (Fig. 7), and the vaults rising from these lower arches to the higher ones having an awkward domical appearance.

If, again, the aisle vaults, as well as those of the nave, were made square in plan, each square of the nave corresponding with two squares of the aisles on each side (Fig. 8),

Fig. 8. 1 plan.

the thrust of the nave vault was brought on every second pier only.

Again, if only semicircular arches are used, those across the diagonals of the square of vaulting, being larger and higher than those of the sides of the square, the windows under these cannot be as high as the centre of the vault. Light is thus lost, and a mass of dead wall is needed over the clerestory windows to form a level bearing for the beams of the roof over the central vault. In other positions, also, the round arch was found awkward. Where the piers were close together, as round the apse of a church, the arches resting on them, in order that their crowns might be on the same line as those of the wider arches down the sides of the church, had to be "stilted," as it is called; that is, perched on the top of straight piers, down which their mouldings were continued to the line of the capitals.

By the use of the pointed arch, all those difficulties were got over. By means of it arches of different spans could be made all the same height. By breaking the round arch into two parts, attached by a point at the top, the arch could be widened or narrowed like a pair of compasses, and by adding to the length of the legs in the longer stretches, could be kept the same height as in the narrower stretches.

In this way the determination to render churches fireproof by means of vaulting produced the pointed style of architecture which we call Gothic. In consequence of being so constructed, our old cathedrals have been preserved to us. Canterbury and Chartres, in our own time, Rheims in the sixteenth century, have had their wooden roofs which covered the vaulting destroyed by fire, without injuring the buildings under them.

For some time after the discovery of the pointed arch the width of the nave con-

tinued to be taken as the size of the square of vaulting, the aisles also being vaulted in square compartments, two to each square of the nave on each side. The defect of the thrust of the nave vault coming on each second pier only was partially obviated by springing a subsidiary rib from the intermediate pier, thus dividing the vault into six parts, instead of four, whence this method is called *sexpartite vaulting* (Fig. 8). Taking the width of the aisles as the size of the square of vaulting, which the use of the pointed arch rendered possible, obviated all difficulties (Fig. 9). The central nave vault

Fig. 9.

became thereby oblong, its length the width of the nave, its breadth the width of the aisles, and the arches across the nave twice the span of those against the clerestory walls, which, springing from the same piers as the nave arcade, were of the same span. (Fig. 10.)

Fig. 10.

The clerestory windows were raised to the full height of the apex of the central vault, sometimes even higher, and the thrust of the vault was equal on each pier. Thus by the use of the pointed arch were completely solved the problems of making both nave and aisles fireproof by vaulting, of bringing the thrust of the vault equally on every pier, and of making the vaults as high at the side walls as in the centre, thus giving height for windows.

Even after the vaults became pointed the windows under them continued round-headed. (Fig. 11.) But a round arch under a pointed

Fig. 11.

one leaves a space something like an arrow-head in shape between them, which it was soon seen could be made available as window. The shapes of the windows were therefore made the same as that of the vaults, and the same form was, from the principles of harmony, carried out everywhere throughout the building.

A new impulse had been given to the art of vaulting by the invention of vaulting ribs. In the Roman groining the angle of the groin consists merely of a line formed by the intersection of the two vaults (see Figs. 7 and 11). The Gothic builders, even while still using the round-arched style, made the angles of the groin strong arch ribs, which form the skeleton of the vaulting, filling in the spaces between these ribs with light flat arching, or even where the distance between the ribs was short, with long stones resting from one rib to another.

These ribs were made to spring each from a separate slender column, one of a cluster. As the style developed the columns and the vaulting ribs coalesced, the capitals dividing them became absorbed, the ribs in late Gothic rising without break from the base of the building to the crown of the arch. The feeling of ascent and growth thus given, with the branching groining ribs meeting overhead, gave rise to the popular theory that Gothic architecture sprang from an imitation of a forest with its spreading branches. The history of the style proves the theory erroneous; yet it is true that it has in it something of the spirit and growth of forest life, as Greek architecture has sympathy with the higher forms of animal life.

The development of the style was doubtless influenced not only by the mechanical

requirements of which we have traced the development, but by the sense of beauty in the mind of its inventors, and by the environment in which they found themselves placed. If, in the problem which they had to solve, they had been guided purely by mathematical principles, they would have found a more perfect solution, not in the pointed but in the elliptical arch. By means of it arches of different spans could have been made to intersect with perfect mathematical accuracy without recourse to the expedient which, in the light of mathematics, is a clumsier one, of vaulting ribs. But in the light of art the result would have been far less beautiful, and even if they had possessed mathematical knowledge sufficient for working out their problem by the use of the elliptical arch, their instinct as artists would have prevented them from adopting it. Besides this, opportunity had made them acquainted with the pointed arch. The Crusades had carried them to the East, which was its birthplace, and where they would see it still in use.

At first the windows were small, leaving large surfaces of wall to be decorated with colour and painting, and the decoration was carried out over the windows also by the use of stained glass. This latter mode of decoration, once introduced, was felt to be so brilliant and charming, that henceforth it ruled the development of the style. The object of every change was to reduce the surface of masonry, and give more space for stained glass. The small windows were put closer together, and the masonry between them reduced to single upright bars of stone, called mullions, narrow on the face, but deep across the plane of the window, so as to give as much opening as possible for glass, at the same time retaining strength. Openings shaped like flowers of three or four, or more leaves, were placed above them; the corners left between were pierced; the stone between these openings was reduced to bars bending round the foliated forms (to which the name of tracery is given); and thus at last one great window was formed, which filled the whole space under the vault (Fig. 10).

These mullioned and traceried windows are one of the most charming features of Gothic architecture, so beautiful in themselves that, like Greek porticos, they have been used even when the causes which led to their adoption do not exist. In large windows, however—especially when these are used in the same building along with smaller ones—a division of their surface by some

such means must always remain one of the simplest and most admirable means of producing architectural effect. Windows of all sizes can thus be brought into harmony with each other, an immense advantage in domestic architecture. The architecture of the walls is, as it were, carried over the windows by bars of stone, giving them greater strength, and solidity, and interest, than if they remained mere great holes in the wall.

The form of these stone bars will naturally partake of the constructive lines of the architecture. Under vaultings they will be curved, but when the architectural construction is altogether in perpendicular and horizontal straight lines, as in our ordinary domestic architecture, the straight form which bars of stone naturally take will be simpler and more suitable.

Gothic architecture had a magnificent opportunity of development in the construction of the great cathedrals, which, in France, were all built at the end of the twelfth and beginning of the thirteenth centuries.

These were civil as well as ecclesiastical buildings; in fact, the distinction between the two provinces was a thing unknown at the time, and is wholly a modern idea, which we never probably would have had, except for the differences in religious belief which arose among us at the Reformation. The State is merely the community acting in combination for those purposes in which combined action is more convenient than individual. With us these are now almost confined to justice, police, war, and possibly education. But when religious belief was uniform, as in the Middle Ages, State action included religion. The bishops and abbots were feudal barons, with civil jurisdiction; and, on the other hand, all State action had some religious character and sanction. The cathedrals were the great meeting-places of the city, used for secular purposes, such as the administration of justice, and even for histrionic performances* (which, again, were religious in character), as well as for mass.

They sprung up just after the towns, along with the right to have walls, had attained freedom and privileges, in fact, as monuments of these and as rivals to the great castles of the lay, and the monasteries of the religious barons. The bishops and secular clergy went heartily with the movement, thereby asserting for themselves the power and importance which had been largely absorbed by the monasteries. All the important towns seemed seized with a mania to rebuild their cathedrals.

* Viollet-le-Duc. *Dictionnaire de l'Architecture*.

dral with a magnificence unknown before. The new architecture, taking nothing for granted, governed only by logical necessities of construction, is an expression of the rationalism of which Abelard sowed the seed in modern thought, though devoted, like him, to the service of the Church. Their architects were laymen, for the most part, as in several instances we know from their names, and the representations which occur of some in the lay dress. In fact, the regular clergy—those living under a rule, or monks, who had hitherto been the sole depositaries of art and culture—disliked the movement; naturally so, for it meant that their use, and consequently their importance, was gone; and they continued to practise still, after pointed architecture was invented, their own old round-arched style.

This is the reason why the architecture of the French cathedrals is in almost every instance pointed, while in England it is generally round-arched. In France the cathedrals were rebuilt in the new style. In England, in accordance with our spirit of compromise, our cathedrals were generally monasteries or minsters as well.

The main characteristics of Gothic are its system of pointed vaulting and traceried windows, filled with stained glass. The former, in the course of development, led to other peculiar features, such as the clusters of slender columns, each carrying a vaulting rib, by which the lines of the ceiling were carried down to the floor, giving the feeling of height and ascending growth; to harmonize with which, and not from any necessities of structure or of climate, the roofs were made steep and sharply pointed. The style possessed also a beautiful and vigorous style of carving, founded on natural foliage, and truthful and admirable modes of metal work.

The change to copying natural foliage for architectural ornament, instead of the carving of wild grotesques of the earlier round-arched style, which the Benedictines of Cluny carried to its greatest excess, is due not only to the decay of barbarism, and the growth of civilisation and refinement, but to the denunciations of St. Bernard. Preaching at Vezelay, where we can still see them, "what business," he asked, "had these devils and monstrosities in Christian churches, taking off the attention of the monks from their prayers?" In the churches of the Cistercian order which he founded, his puritanism forbade ornament altogether, which does not, however, divest them of their art, but pro-

duces the manliest and severest type of Gothic. When the artistic genius of the people was untrammelled, it produced the exuberance of decoration inspired by the appreciation of the beauty of foliage, which usually characterizes the style.

This cathedral-building mania (which was really analogous to the railway mania of our own day) lasted in France just about eighty years, the cities then ceasing to find that their privileges and the importance of the clergy (even of the secular clergy) were identical. Strifes arose, the clergy forbade the use of the cathedral bells for town meetings; the building impetus stopped before a single cathedral was finished, and though parts have since been built, most of them are unfinished, and not one has been completed according to the original design.

The style thus developed was, of course, used for other purposes than churches. The possibility of building in any other style than the prevalent one, or even the existence of any other, was inconceivable in times when Roman emperors were represented sitting under pointed arches; and the scenes of the New Testament were conceived of as transacted in mediæval cities, by people dressed in mediæval costume.*

Castles and houses were therefore built in Gothic, and the mouldings and minor ornaments were the same as in churches. Pointed windows and tracery, however, from the first it was found necessary to modify; while between vaulted floors when height was valuable, flat arches, segments of a circle, were adopted.

It may be urged against the statement that vaulting is an essential of Gothic architecture, that Gothic churches, as well as domestic buildings, in England especially, frequently had wooden ceilings, and this not always from economy, but even, as in St. Stephen's Chapel at Westminster,† where the wealth of English art was lavished. This, however, does not disprove the fact that the pointed style arose from vaulting necessities; and, indeed, to the use of wooden roofs in England may, I think, be traced the abandonment of the pointed arch, and the adoption of the flattened perpendicular form; while in France, where the use of vaulting was continued, the pointed arch

* One of the most curious instances of this dormancy of the historical faculty occurs in a picture at Antwerp of our Lord bearing his cross, in which the "stations" are marked by the usual crosses. A Calvary without the "stations" was inconceivable.

† Destroyed by Sir Charles Barry, from a regard for harmony, the style being earlier than that which he was using in the Houses of Parliament.

also was retained to the last. The wooden ceiling left the walls divided into square-headed spaces (instead of the arched ones under the vaulting), which a pointed window could not fill (Fig. 11). The window arch formed with the straight, level cornice, awkward corner spaces, called spandrls, which there was always a difficulty to know what to do with. So the haunches of the arch were raised, making the window nearly square-headed, and adding the space occupied by the spandril to the amount of stained glass (Fig. 12).

Fig. 11.

Fig. 12.

In every instance, in fact, in the history of the style in which the use of pointed vaulting was given up, the abandonment of the pointed arch sooner or later followed.

An explanation of the development of Gothic architecture, such as we have attempted to give, showing its principles, and the purposes which it was created to serve, enables us to form an opinion as to its suitability for our domestic architecture.

It disposes at once of several invalid and absurd arguments against our using Gothic. It has been asserted that the style is gloomy and dark, and does not give sufficient light. Now, one of its chief characteristics, as has been shown, is that it is all window—that the main aim in its development was to reduce the surface of the wall, and increase the space for stained glass. No doubt old Gothic castles had little window-light, and this characteristic, adopted for purposes of defence, has been sometimes foolishly copied in modern Gothic houses; but it is plain that it is no essential of the style.

Again, it is called a barbarous product of the dark ages, when the people were serfs; and one of the means by which a rich and powerful clergy kept them in ignorance and darkness. On the contrary, it was the product of the revived intelligence of the people, the outcome and sign of their civil freedom; and it gives evidence of a development of art, of skill and refinement and grandeur in

building, such as we are incapable of furnishing.

It is said to be a style purely ecclesiastical; it was just as much civil. It was in fact, in its origin, the lay style of architecture, as distinguished from the religious or monastic.* That in England and in Scotland the monastic buildings are frequently of pointed architecture, is due to the fact that the development of the monastic system took place later with us than in France, and after the Gothic style was formed.

Is there, however, anything in the Gothic style which makes it (as is often asserted) more suitable than any other for our modern houses?

For this, it is not sufficient that it may appear to us more beautiful than any other. Our grandfathers thought Greek porticoes so beautiful, that they were willing to block up their window-light to have them. We see now that this practice was absurd (though Mr. Ayrton has repeated it in his new Post-Office); that it destroys not only the expression of truth in the houses, but the beauty of the portico, by using it where it has no meaning. No architecture can be satisfactory, even from an artistic point of view, whose forms are not founded on use.

Of the various characteristics which make up Gothic architecture, its system of vaulting does not suit our ordinary domestic requirements. For great halls, where any amount of height can be given, the height occupied by the pointed vault is no disadvantage. But in a building divided into storeys, as our houses are, it is; and if in special buildings we want fireproof construction, we can get it conveniently and cheaply by means of iron and brick, or concrete, in the usual thickness of a floor, without the loss of space which would be involved between the springing of the vault and a level floor over its crown.

In the modern revival of the style, however, in not one in a hundred of the thousands of our churches,† and in houses still seldomer, has any attempt been made to revive the vaulting. It is therefore hardly necessary to urge that a thing is unsuitable for us which we are never likely to use. Nor would the system of vaulting by flat arches be tolerated by us inside our houses. It is grand, but would be thought prison-like and dismal, and, from its expense, could never come into general use.

* See the evidence given by M. Viollet-le-Duc, "Dictionnaire Architecture."

† Modern French churches are often vaulted in stone.

In fact, in the application of Gothic to house-building, from the earliest period the pointed arch was dispensed with. In a house at Rheims, called the House of the Musicians, from the statues in pointed niches between the windows, which was built between the years 1240 and 1250, during the highest development of the pointed style, while the pointed arch is used for all the decorative features—such as the niches and the range supporting the cornice, it is frankly abandoned in the windows, where the form would have been impractical. Numerous instances occur where the pointed arch is retained over the windows, but the window openings are square. The glass was set in wooden frames, so as to open like shutters; and the architects were too sensible to attempt to make these in such an awkward form for wood construction as a pointed arch. In another form of window common in old domestic Gothic, the pointed arch is purely ornamental, carved on a simple straight lintel. Even when in great halls, built for civil and domestic purposes, pointed vaults and consequently pointed windows were used, the lower lights of such windows being arranged to open for air and view, were always square-headed.

From these examples of the practice of mediæval architects in domestic buildings, it is obvious that if we adopt Gothic architecture for our houses now, we ought to dispense with the use of the pointed arch.

Yet, as in all copying, it is the form, and not the spirit of the original, which is apt to be retained, our architects and builders think they are working in the Gothic style when they stick a pointed arch where it is not wanted, and means nothing—possibly an arch one brick thick, on the face of a wall supported by a wooden lintel inside—while the whole construction and details of the house follow the ordinary classic traditions.

Old Gothic attempted honestly and fearlessly whatever use or necessity dictated. It has always the merit of truthful and apparent construction. But this also to some extent unfits the style for modern use. It involves, unless when money could be lavished in decoration, an appearance of severity which does not accord with our modern feelings, and is least appreciated by the poorer and less educated, in whose houses, did we attempt really to carry out the principles of the style, it would be thoroughly disliked. Even in houses where no expense is spared, we should not like the appearance, however truthful it might be, of stone arches inside our rooms.

Moreover truthfulness of construction cannot be classed among the excellences of modern Gothic. The copiers of the style, after the manner of copyists, are very apt in their zeal for its forms to neglect its spirit. Few better illustrations of this could be given than the polished oak boxes given as wedding presents, with magnificent brass hinges meandering over them, which make it seem as if no amount of wear or ill-usage could separate the lid. Unfortunately, those great hinges have no joint; the work is done by a little feeble one, which it is attempted to conceal, fastened by two minute screw-nails; so that, with all its appearance of massive strength, the lid could be prised open with a penknife. Of course a hinge is stronger if the tail is well fastened to the wood, and the old architects spread the hinges all over their church doors, in all sorts of playful, twisted forms; but this was always the strengthening of a real hinge. So different is the modern Gothic practice of ornamental door hinges, that the workmen's ordinary name for these is "the shams."

Again, why should Gothic grates have "fire dogs?" Before the forests were cut down, in the great old open hearths, in the days when people burnt wood, they were necessary for resting the logs on, to let air under them to keep them burning; but it is sham Gothic to stick them on a grate for burning coals. And why should our gaseliers be made like the old coronas or crowns? These were great rings or hoops, suspended from the ceiling, with candles stuck round the circle. When the gaselier is very large, and the lights numerous, this may still be a convenient arrangement for gas-lights; but in a four-light dining-room gaselier, the brass hoop is perfectly useless, and it obstructs a deal of light. Such a design, while a revival of a Gothic form, is contrary to the spirit of the style.

It is seldom that architecture attaining its ideal has founded itself strictly on constructive necessities, using such ornament as could consistently be added, and no other. The human mind moves so slowly, and sticks to old habits so long, that for centuries after a nation has given up wood construction, we find it copying wooden forms in stone buildings. In the gateways of Hindoo Temples,* enormous trouble and expense has been taken to procure posts and cross-bars of stones like long logs of wood; and of course the nail-heads, which

* See photographs in Fergusson's "Tree and Serpent Worship."

in wooden construction fastened the logs, are carefully carved in the stone. Even in Greek architecture, the triglyphs which divide the frieze into spaces are said to be the reminiscence of the notched ends of the wooden beams of the roof. As to Roman architecture, its decoration has nothing to do with its construction, but is the artistic expression of a wholly different one. In fact, the history of all arts and ornament consists very much in tracing ornamental forms back to some long-forgotten use which gave rise to them.

Illustrations without end might be given of this, but the following, though slight, are as good as any. The holes arranged in waves and zigzags on the toe-caps of shooting-boots are the reminiscence of the old Highland brogues of untanned leather, which allowed the water to soak through them, and consequently had to be provided with little holes at the toes, where it squirted out again with the pressure of each step. Again, the bands on the backs of books have similarly now no constructive use, except in some of the best-bound books, in which they still cover the cords to which the pages are sewed. Such features in an art are not unnatural; on the contrary they are analogous to the imperfectly developed organs of animals which in the ancestors of the species had performed functions now superseded from change of habit and development of the organism.

To the old Gothic architecture belongs the almost singular merit of perfect truthfulness. When a form ceased to have meaning, it was frankly given up; people did not, as in most other styles, weakly cling to the dead carcase. This evidences, instead of the ignorance and darkness usually attributed to the Middle Ages, a freshness and independence of thought rare in the history of humanity, and a wealth of artistic conception employed in making every new necessity beautiful, which few races have possessed. If we could but do likewise, the result of working on the principles of Gothic architecture would be something very different from pointed Gothic. We should have no pointed windows, and quatrefoils, and buttresses which receive no thrust. We should not have in stonework chamfer stops at the angles of windows, simulating wooden framed work; and all sorts of ugly and unmeaning notchings; and roofs so steep, that they endanger men's lives.*

* In old buildings these steep roofs had usually a parapet at the cornice, which saved any workman, slipping on them, from falling over the wall.

We should ruthlessly abandon forms that are unsuitable, which are not developed by our modern necessities, even though we love and admire them for their beauty. Can it be said that the Gothic revival has exhibited these signs of the true Gothic spirit? On the whole, certainly not; and we fear that such vices as appear in it are almost inseparable from the attempt to apply a thirteenth-century style to nineteenth-century use; that the Gothic style is, in fact, *the artistic expression of an obsolete mode of construction*.

Must we then give up hope of having a style of architecture suitable for our dwelling-houses, fitted for our use, and true and beautiful in point of art? Gothic does not answer our requirements, while the common builders' style, which is that of the houses most of us must live in, though the growth of our wants, and therefore in the main suited to them, becomes yearly more degraded and ugly.

"Why don't architects invent a new style?" say some. We might almost as reasonably ask grammarians to invent a new language. The time needed for the development of the great old styles of architecture is measured in centuries, not in years, and though in the present day our thoughts move faster, this but makes us liable to see-saw from one style to another without any real progress, instead of sticking to a single style and steadily improving it.

"But what style should we adopt?" As well ask what language must we adopt. We cannot alter our history and our birth. As there is a common language which every one more or less understands, so there is a common architecture which arose with the growth of modern thought, and has been the architectural style of the country for the last three centuries, which every builder naturally follows, which every workman has been apprenticed to, and more or less understands. But while our language has been kept up to a reasonable mark of artistic excellence by a high standard of criticism and the constant efforts of educated minds, our vernacular architecture is characterized by the vulgarity and commonplaceness of the men in whose hands it has been left. The interest of refined and educated minds for the last thirty years has been directed not to improving the vernacular style, but to the hopeless attempt of supplanting it by another, which appeared at first to flourish, but has not taken root in the soil of the country.

JOHN J. STEVENSON.

THE STORM OF LIFE.

BY HESBA STRETTON, AUTHOR OF "JESSICA'S FIRST PRAYER," ETC.

CHAPTER V.—A FAIR WIND.

T was a large, old-fashioned chaise, with a hood covering the seat and half concealing the driver; but Rachel knew it, and knew

who was driving it, the instant it came in sight. She would have willingly walked miles out of her way to have escaped meeting it. But there was no escape; the high hedges on either side forbade any attempt to force a way through them, and the carriage must overtake her in a minute or two, however quickly she walked on. She turned her back towards it, and bent her face over Rosy, but as the wheels moved slowly over the crackling road she heard them coming to a standstill opposite to her.

"Why! Rachel Trevor!" exclaimed a quick, agitated voice.

Rachel drooped her head till her face was quite hidden upon her child's shoulder as she listened for the carriage wheels to move on more quickly than before; but there was no sound for a minute or two, except the impatient pawing of the horse's hoof on the hard ground.

"I thought," said the voice again, "that you were some poor woman who would be glad of a lift this bitter day. Where are you going to, Rachel?"

"Oh, I don't know," she cried bitterly, "I don't know where me and Rosy can go. There's no place for us as I can think of."

"I'm going to the station," said the lady, who was driving in the chaise alone, "get

up beside me, and let us talk about it as we go along."

"Not me, ma'am," cried Rachel, "not me!"

"Yes, you," she answered, "here, lift your child up to me quickly, and get in yourself. I did not know your time was up, Rachel."

"Oh! I can't take your kindness," murmured Rachel, "when I've robbed you and wronged you——"

"Ought you to take God's kindness, then?" asked the lady; "you sinned against Him more than against my husband and me. Come; your little girl will perish with cold."

Almost against her will, Rachel carried Rosy to the chaise and lifted her up to the lady, who wrapped a thick shawl about her, and put her into her mother's lap as soon as she was seated. Rachel's eyes were filled with tears; but she dared not open her lips. The last time she had seen her former mistress was when she had borne witness against her on her trial, and completely broken down her plea of "Not Guilty." But for her clear evidence she might have escaped from the consequences of her sin. She had appeared to be a pitiless enemy to her; but there was no enmity in the grave, thoughtful face beside her now.

"Your husband was transported," said Mrs. Curtis, after a long silence, "and cannot return for another three or four years, if he ever comes back. How do you intend to earn a living?"

"I can work," she answered, in a tremulous voice, "and I'm willing to do anything."

"Ah! but you have no character," said her mistress. "I have been thinking of you often since your chaplain wrote to me and said he had great hopes of you. You told him you believed in our Lord Jesus Christ. Do you, Rachel?"

"I haven't got any book-learning," said Rachel, anxiously, "but I believe God gave us his dear Son for us to try to be like Him, and He's longing for us to love Him and to be good, and never sin, never no more. I don't know much about Jesus Christ, ma'am; where He used to live, nor what He said, nor the things He did, because I can't read quite perfect yet; but the chaplain said He loved me so that He'd died for me; and I'd like to do something back again, however hard it is, for love's sake."

Rachel had found it difficult to speak for the trembling in her voice, and she pressed Rosy closer to her to give her courage. She wished her mistress to know that she was not the same hardened, unprincipled woman she had been before her imprisonment; and yet she was afraid of saying more than she ought to say about the Lord and Saviour, whose name she felt unworthy to utter. Mrs. Curtis looked at her pale, sad face in silent surprise. Could this be indeed the wild, giddy, and ungrateful girl, who had taken advantage of her former position as her servant to lead a band of burglars into her house?

"Rachel," she said at last, "if you truly believe in Christ, you will show it in your future life. You'll find plenty to do to show your love for Him. I know a lady in London who takes strong and active women of good character out of England to countries where they can get their living easily. I will write to her, telling everything, and ask if she can help you in any way. If she will take you, I will try to pay your passage out, with your little girl. You had better go at once; this very day. I will drive you to the station, and in four hours you will be in London. My husband would not approve of my taking you home, or even of my helping you in this way; for he will never recover the shock of that night, and he cannot forgive you. You must not even write to me, for it would excite and distress him. Rachel, you know how feeble in health he was before that night, and he will never again be as well as he was then."

"I never thought of it," cried Rachel; "they were always telling me how clever I was, and when I said how easy it 'ud be to get into the hall, they snapped at it. I hope I shan't see any of them in London. They came from London mostly, and I'm almost frightened of going there."

"It will only be for a day or two probably," answered Mrs. Curtis. Miss Murray will see to it. I will write to her at my bookseller's in the town, whilst you and the child go on to the station. I do not wish any one to see you with me, lest my poor husband should get to hear what I have done."

"I wish I could ask him to forgive me," said Rachel sorrowfully; "he was very kind to me when I waited on him. I didn't think what I was doing."

Now she looked at her mistress she could see how much older and sadder she seemed than in former times, and how white her hair had grown. Deep lines of care and

anxiety were graven on her face, and her eyes were sunken as if with much watching and many tears. She could not bear to think that she had been the cause of this trouble.

"We have never known a night's rest since," said Mrs. Curtis, as if she had seen Rachel's thoughts, and wished to deepen her regret and penitence. "Many, many times, at the least sound, I am compelled for his sake to go round the house and see that all is safe. Sometimes I fear he will lose his reason. No, Rachel, you did not know what you were doing, or even you and your comrades would have had pity on us. But I forgive you, and, please God, my poor husband will be brought to forgive you by-and-by. You must make up for it by being good now."

"Be good!" Those were the very words the chaplain's letter ended with. Now her mistress said the same. If she could only do something to make up for her bad life, and the sorrow she had caused in the world, she would be ready to die. Rosy should grow up a good girl at any rate; she should learn about God, and Jesus, and heaven, from any one who could teach her. For Rosy's sake, she herself would never fall into sin again. When Mrs. Curtis put them down from the carriage at the entrance to the town, Rachel walked through the streets with a firm, steady tread, as if every step she took towards the station brought her nearer to that new and better life which lay before her in London. By-and-by Mrs. Curtis came down to the station after them, with the letter she had written to Miss Murray. There was only time enough for them to get some food in the refreshment room, and then the train came in which was to carry them away from their friend. Rachel's heart beat fast with hope, and sorrow, and gratitude. She could only grasp the hand of her mistress between both her own, and stooping down hurriedly, pressed her lips upon it.

"Good-bye, Rachel," said Mrs. Curtis, "remember to be good!" The train started, and Rachel leaned out of the window to catch a last glimpse of her grave, gentle face. Yes, she would remember. Nothing could ever make her forget her sin, and its bitter harvest to herself and others. What had any one gained by their crime? Her husband was still a prisoner; she had suffered a long penalty; Rosy had lost her happy childhood in a workhouse. Now she saw what misery she had brought upon her kind mistress, and the master who had never injured her. As for herself, there was a black

blot upon her life, which no tears could ever wash away. Even her child knew that her mother had been a wicked woman, and must remember it against her till her dying day. How could she ever forget? Would anybody forget? Would God Himself forget her sins?

Yet how good the chaplain and Mrs. Curtis had been to her, though they had known all about her wickedness, even though her mistress was suffering constantly because of it! If she could forgive her, was it not sure that God would forgive her? Her mistress had seemed to feel gladness in forgiving her, and a smile had shone out on her face when she had waved her hand to Rachel at the last moment. Surely God would not be angry with her all her life. She recollected hearing a verse out of the Bible, "He will not keep his anger for ever." She could believe it now Mrs. Curtis had plainly forgiven her, and befriended her, in spite of all. Rosy was on her lap, sheltered warmly in the shawl which had been wrapped round her by her mistress, and asleep with her head on her mother's bosom. The new life had begun, and it seemed to Rachel that it would be easy to be good.

CHAPTER VI.—CROSS CURRENTS.

THE short day was ended when Rachel, with her tired child, reached London. It was the first day Rosy could recollect spending outside the workhouse and its square walled-in playground. She was bewildered and fretful, and her old childish dread of the wicked woman who called herself her mother came back when she found herself alone with her in a strange place. She cried bitterly for the only home she had ever known, till Rachel did not know what to do with her. If she had been a baby still, she could have cradled her in her arms, and carried her gently through the crowded and bustling streets, where the passers-by were constantly jostling against them. Rosy pattered along the pavement beside her, through the slush of the melted snow, making her heart ache with her quiet wretchedness. She spoke cheerily and tenderly to her, but Rosy did not answer, or only answered by a sob.

Still this cold, comfortless tramp along the slushy causeways would not last long. One of the porters at the station had read the address of the letter she carried for Miss Murray, and told her how to find the place in a street not very far away. Now and then she ventured to stop some poor person like herself to ask if she was in the right direc-

tion, and everybody told her it was close at hand. Yet it seemed a long while before she found it. But it was reached at last, and Rachel saw a small boot and shoe shop, with a narrow frontage of building rising five or six storeys above, and appearing to be squeezed in between two larger houses of business. It did not look a very important place, and Rachel entered it more confidently. There was a young woman behind the counter, and a customer turning over some ready-made shoes. The assistant glanced at the name on the letter, and tossed it back to Rachel.

"Gone away from here," she said carelessly; "left five months ago. I think she went off to Australia, or somewhere else, with a batch of servant girls. Anyhow, she's gone, and I don't know anything about her."

Rachel stood dumb for a minute. No difficulty about finding Miss Murray had crossed her mind, so fully had she depended upon Mrs. Curtis's letter smoothing every trouble of that kind out of her way. But here was a serious perplexity. She did not know a soul in London; she had not any idea where she could find a shelter for the night; and, like many country people, vague fears possessed her about untold dangers which awaited strangers. Lingered till the customers were gone, she spoke again to the girl behind the counter.

"Is there anybody that 'ud be likely to know?" she asked nervously. "I'm just come from the country, and my old mistress gave me this letter for Miss Murray to find me a place at once, where me and my little girl could sleep to-night. Maybe somebody in the house could tell me where to look for her."

"Oh dear no!" answered the assistant. "She only had her office here; she lived out somewhere in the country, I think. They're all strangers in the house now, and we know nothing about her. We've had no end of bother with servant girls coming after her. There's lots of lodging-houses everywhere, if you only keep your eyes open; or you can ask a policeman to tell you where to find one. It's quite easy. There! Good night."

Rachel felt that she must go, though her heart sank at leaving the only spot in London where she seemed to have some right to be. Rosy was beginning to cry again; and her first pressing care was to find as quickly as possible some decent lodging, if she only knew where to look for

it. Mrs. Curtis had given her some money, and the sovereign the chaplain had sent for her remained unchanged; there was no immediate anxiety about means. Her dress, too, and that of her child, was tidy enough for poor people; but she hesitated a long while before she could make up her mind to ask a policeman, feeling half afraid that in some way he would know that she had been in jail. Yet when she ventured to stop one, he answered her so mildly, and gave her such careful directions where to go, that she was quite reassured. Right thankful she was when she could undress Rosy, for the first time for so many years, and lay her softly down in bed, where her sobbing was soon lost in sleep. Though she could not fall asleep herself, until she had been lying awake for hours, pondering over the sore strait she was in, she felt a strange happiness in listening to Rosy's regular breathing, and in feeling her lying, soft and warm, in her arms.

"Do you know anywhere I could look for work?" asked Rachel, the next morning from the woman who kept the lodging-house. All the other lodgers had gone, and it was plain that Rachel and Rosy were not expected to stay during the daytime.

"Work!" repeated the woman. "There's a great want of work in London. Folks crowd in so in the winter, and they're all crying out for work. I'm a summer waistcoat-stitcher myself. I haven't had a day's sewing since September. What sort of work do you want?"

"Anything," answered Rachel; "sewing, or cleaning, or washing; anything. I've been a house servant, and there isn't an idle bone in my body. My mistress 'ud say that much for me."

"And you've got a character?" she asked. "These letters are your character, maybe?"

Rachel held both letters in her hand—the chaplain's and the one for Miss Murray. But neither of these would procure her work; her sad story was too plainly told in them. She put them hastily out of sight into her pocket.

"No; those aren't my characters," she answered. "Must I have one before I can get work?"

"Not much chance without, and not much better chance with," said the woman.

"I'll go and try," said Rachel, "if you'll let me leave Rosy with your children. I can but write to my mistress in a day or two, and I've plenty of money for a while."

"Oh! ay! you may leave your little girl,"

said the woman civilly; "and you'll want your bed again to-night?"

"To be sure," she answered. She could hardly bear to let Rosy be out of her sight, especially in this strange, busy place; yet she could not take her to tramp about the cold streets. The search for work might be a long and toilsome one. She was ready for work of any kind. She was strong and industrious; her appearance was pleasant, and her voice and manner were gentle. There was nothing to prevent her taking a place as a valuable servant; nothing except the dark past, and Rosy.

But when she found herself in the streets she felt bewildered and confused. Now Rosy was not with her, demanding her constant thought and care, she was stunned by the noise, and dazed by the myriads of people passing and re-passing. She did not know where to turn or how to set about seeking for employment. Now and then she ventured to speak to some ill-clad, broken-down woman of middle age, whose face bore the traces of hard work and patient struggling with poverty, and in her soft country voice Rachel asked each of them where she could find something to do, and how they managed to earn a living. But there was little information and less comfort to be gathered from what they told her. Times were bad and work was very scarce for women, except domestic service, and that was not open to Rachel.

"Die rather than fall into sin!" These words seemed to ring in her ears, through all the din and noise of the city streets. She repeated them to herself mechanically almost without knowing what she was saying. To her ears the church bells seemed to chime them, and the hoofs of the horses passing by echoed them—"Die rather than fall into sin!" There was sin enough in the city, but there did not appear to be any work for her.

It was some days before Rachel could determine to write to her mistress, for Mrs. Curtis had told her distinctly not to write to her, lest the letter should excite and anger her husband. But at length her hopelessness grew too heavy for her to bear, and she resolved to venture upon making known her difficulties. She could write but slowly, for she had not had much practice in jail, and then it had been chiefly in copying hymns and texts on her slate. But after a long effort she wrote the following letter:—

"DEAR MISTRESS,—This comes hoping to find you well, as it leaves me at present,

thank God for it. Dear mistress, I am very unhappy, or I would not write to you for fear of the master. I hope he won't see it. Miss Murray is gone away from that place, and they say she went to Australia. Rosy and me are living in a lodging-house, and my money is almost done, and I cannot find work anywhere. I know I deserve it all, but Rosy never did any wrong, and I can't bear to see her suffer. Sometimes I think I ought to have left her in the house and gone away to shift for myself by myself. But I can't part with her again, never. I'd rather starve with Rosy than I'd be like the queen without her. I'll work my fingers to the bone once I get work to do, so as I can keep her happy and get her eyesight seen to. The woman that keeps the lodging-house says there are proper places here, hospitals for the eyes, and the doctors can cure Rosy only by looking at her. It was being in the house made her blind, and I'm not content to take her into the house again. Dear mistress, if you can do anything for us, we are very poor, and my money's near gone. Please God, I'll be a good woman and honest woman yet, to show I'm in earnest and not making believe. So no more at present from your poor servant,
"RACHEL TREVOR."

Poor Rachel! She wrapped up her letter, and directed it very carefully, and dropped it into the post-office with an anxious yet hopeful heart. But she had never thought of putting in the address of the lodging-house where she was staying. This was the first letter she had ever written, and her mind was so full of the trouble she was writing about that she forgot the most important thing, after all. Mrs. Curtis received it safely; but there was no chance of answering it, and with warm, pitying tears shed upon it, she was obliged to lock it away out of sight, and through the wintry nights and bleak days of spring, she often wondered what had become of Rachel and her child.

CHAPTER VII.—IN THE TEETH OF THE STORM.

WHAT had become of her? Day after day passed by while she looked for a letter from her old mistress, and very slowly died away the hope of having one. Her small store of money dwindled, though she laid it out most jealously and never satisfied her own hunger, in the dread of soon not being able to satisfy Rosy's. At last they were obliged to quit their lodgings, and drifted down to casual wards and night refuges, where there

was nothing to pay, but where they could only find shelter for the night. All day long they loitered about the streets, hiding from the rain and sleet in the door-ways of empty houses or under the arches of some bridge. They were not alone in their poverty, everywhere there were women and children as wretched as themselves, who would often share with them a crust of bread, or give them information as to where they could secure a resting-place for the night. Rosy grew thinner, and the outfit she had brought away from the workhouse was already wearing into tatters, for there was no chance for Rachel to keep them clean and mended. Her eyes were certainly worse from constant exposure to the winter's cold and from want of nourishing food. But she had grown fond of her mother, the poor, broken-hearted mother, who was never weary of caressing her, and of shielding her as far as possible from suffering. She clung to Rachel, and in spite of cold, and hunger, and weariness, she cried bitterly if any word was spoken of her going back into the workhouse.

This was the dread that lay nearest to Rachel's heart. She could not let Rosy go. Yet if she did not find regular work soon, they must apply for parish relief and go into the house and be parted. It was a thought of untold misery. Already her sin had cost her some years of her little girl's life; she had lost altogether her baby with its golden curls and pretty laughing face, and now, if Rosy and she must be separated, who would see her growing up? who would be tender and gentle to her? who would teach her to be a better woman than she had been? When Rosy, in her childish voice, sang the hymns she had learned, with her arms round her mother's neck, or knelt at her knee and said "Our Father," Rachel felt that she could not be overcome by temptation. But if Rosy was gone, why, the poverty and the misery would grow too strong for her. There were so many open roads back into sin; there did not seem to be one leading to honesty and good.

Rachel was wrong; but she was wrong through ignorance. It was no wonder that she began to think it could not be true that God saw her. When Hagar was wandering in the wilderness, and the water was spent, and her child lying under the shrubs was dying of thirst, while she went and sat ^h down a good way off, that she might not ^p see him die, her heart was too heavy to ^r ^{uck} ^{ce} ^{our} ^{ber} that she had cried, "Thou, God, ^{evil} to me," when she was alone in ^{he} ^{outside}

The child's sufferings made her blind, and deaf, and dead to all other things. It was when the angel of God called to her out of heaven, telling her that God himself had heard the voice of the child crying under the shrubs, that her eyes were opened, and she saw a well of water close by. God had heard, not her cry, but the child's. Rachel, too, was blinded by Rosy's misery. If God would but hear Rosy's voice, then she would know for certain, "Thou, God, seest me."

She could not watch Rosy dying. They had been some weeks in London now, and a deep despair was settling down upon Rachel. She had seen the sunset, and the lamps lit one evening, late in February, and a thin chilly mist was creeping through every street in the city. They had been singing along a quiet street, where there was no great rattle of wheels, but not a single person had glanced through door or window, nor had any passer-by dropped a penny into her hand, or Rosy's. The child was beginning to cough now, and could sing no more. They had reached the last depths of wretchedness, beyond which there could be nothing lower, unless she fell into sin. Where were they to go for the night? By this hour all the casual wards and refuges would be full; and, besides, Rachel felt that it was useless to go on any longer, starving and shivering all day, with but a slender hope of shelter at night. They had never yet passed a night out of doors, under the wintry sky; but she had talked with women who had, women, whose children had crouched and cowered about their knees, vainly crying to be warmed and fed. She had no longer strength to bear up against her despair.

They wandered on slowly and aimlessly; Rachel hardly knowing that they were moving at all. Rosy's cold hand was in hers; a little, thin, icy hand, which could not be much colder if the child were dead. All the weakness, and the helplessness, and the wretchedness of her little daughter seemed to pass into herself, and was tenfold heavier to bear than her own misery. They might have been in a wilderness, with no man near them. There was no one who cared for them; no hand held out to them. All the voices that passed by spoke no word to them. There were firesides only within the houses, but there was no place for them anywhere. Thousands of homes were there; but they were homeless. Nothing belonged to them, but in the darkness, and their hunger, and their weariness.

"Oh! I started up from these miserable,

half-felt thoughts; and found that their feet had strayed on to one of the bridges which crossed the river. The mist hid the water from them; but it was there, below, swift and dark. Only one step over, into the mist, and all her sufferings, and Rosy's, would be ended. Then she would neither be parted from her child, nor yet see her die. They would be together, locked fast in each other's arms. If God really saw them, He did not care. "Die rather than fall into sin," said the chaplain's letter. Well! she was going to die.

Yet, she would like to nurse Rosy on her lap again for a few minutes; and feel her arms about her neck. She had missed it so whilst she was in jail. And Rosy must say, "Our Father" once more, before she fell asleep for the last, last time. Oh! if it had but been true that God loved her! She did not want to die. It was the dread of dying slowly, and first seeing Rosy pining away, that was urging her on to end it all. There was no honest way of keeping in life; and there was no chance for her.

She had sat down in one of the recesses of the bridge, and taken Rosy on her lap. But just as the child, with folded hands, had begun to say, "Our Father," a policeman came up and stood over them, tall and threatening.

"Come now," he said, "I've got my eye on you. You'll not try on any tricks here this night. We've had too much bother with young women like you these last few days. So just move on, will you? and I'll take care to see you off this bridge. I promise you."

Rachel rose up silently, and moved away, closely followed by the policeman, till she had crossed the river. A sullen recklessness had taken possession of her. They would neither let her live honestly, nor die. Well, then! her husband and his comrades had always told her how clever she was, and how well her pleasant face and manner would help her to get a living. She was forced to go back to the old ways, and who could blame her?

They had turned down a street, with small houses on each side, some of them shops, and some evidently the homes of working people earning good wages. The mist was no thicker than earlier in the evening; but the chilling damp of it wrapped about them, as if it had been the cold flood of the dark river itself. There was not a person in sight; and only one or two had passed them since they turned into the street. All at once the pleasant scent of new bread fresh from the

oven smote upon her craving hunger, and, at the same instant, Rosy clutched her hand convulsively, crying, "Look there, mother!"

A boy was passing them with a large basket on his arm, and he was opening the lid to break off morsels of the brown crisp crust to feast upon as he walked along. Her own gnawing hunger and Rosy's eager cry were too strong to be conquered. She snatched the basket out of the lad's grasp, and holding her child's hand firmly in her own, set off to run as swiftly as she could drag her along, towards the corner of another street, which was not very far away.

But the boy set up so quick and shrill a cry, that before she had run a dozen yards, she felt a man's strong grasp upon her arm from which it was in vain to try to escape. Rachel stood as if she had been turned into stone. She knew that all was over now—all was lost. She could not open her parched lips to utter a word. There was no hope for her. The old round of prison-life would shut her in once more, under bolts and bar; and Rosy would be taken back again to her workhouse home. The boy was already beside her, and had snatched the stolen basket from her nerveless hands.

"It's me, Sylvanus Croft, the chimney-sweeper," said the man who held her, "you know me, don't you, my lad."

"Ay!" gasped the boy, "I know you, Mr. Croft. You hold her fast, while I run for a p'leece. There's one round the corner, and I'll find him in no time. My! if you hadn't a caught her, she'd have been off like a flash o' lightning, and mother 'ud have lost all her batch of bread."

"Wait a moment, my lad," said the sweep, "let's hear her speech first. She's lost her breath, and can't say a word for herself. Don't let us be too sharp, there's not much harm done yet. Folks are drove to it sometimes."

"Oh! don't you give me up to the police," whispered Rachel, earnestly. "They'll part Rosy and me again for years and years. I didn't want to steal again; I didn't for certain. But it came on me so sudden, and Rosy and me we've tasted nothing since morning, not one morsel. I thought to drown myself and her in the river, and the police wouldn't let me. Ah! whatever shall I do? whatever shall I do?"

She wrung her hands and cried bitterly; whilst Rosy put her small cold hand into the sweep's, and spoke in her weak and childish voice.

"Mother's trying to be good," she said,

"she's been a wicked woman once, but she's trying, oh so hard, to be good. But we've had nothing to eat all day, and we've nowhere to go to, and all our money is gone."

"Listen here, my lad," cried Sylvanus Croft, "they haven't had bite or sup since morning. I must look further into this, and if it's true, it 'ud be a shame to give 'em up to the police. I'll take 'em home with me, and lock 'em up safe for the present; and you give my duty to your mother, and the thief 'll be found safe and sound at my house, if she wants to persecute her."

CHAPTER VIII.—A HARBOUR OF REFUGE.

RACHEL did not attempt to resist, when Sylvanus Croft, keeping a firm yet gentle hold of her arm, led her away from the place where she had again fallen into sin. The terrible consequences of it had flashed across her mind at the first mention of the policeman, and she was shivering and trembling from mingled weakness and fear. Rosy ran by her side sobbing. Her little girl had seen her attempt to steal, and her vain flight; and now she saw her dragged along, not by a policeman, thank God! but by this stranger, who after all might perhaps give her up to justice.

Before long Sylvanus paused opposite a house of three storeys, on the first floor of which there were two windows, with white curtains drawn across them. The cheery flickering glow from a good fire burning within shed a bright gleam into the darkness, and with the aid of the street lamp immediately below, lit up the whole front of the building. There were several large and boldly-painted sign-boards displayed upon it, from the basement to the roof. "Sylvanus Croft, Chimney Cleaner to Her Majesty's Public Works." "Chimney Sweeper to the Society for the Suppression of Climbing Boys." "Smoky Chimneys Effectually Cured." "No Cure, No Pay." The master's eye lighted up with satisfaction, as he glanced up and down his habitation. There was so much brightness and cleanliness and cheerfulness about it, that he could not keep himself from pointing it out to Rachel.

"That's my house," he said, "and that's mother's room, up there. She do love to be spruce and clean, more than most women, I think. Yet she married me, a master sweep. That was 'love, I say. She's bed-struck now; never stirred hand or foot since our little Sylvie was taken away from the evil to come. But I can't abear to let the outside

get dingy, for fear she'd feel it; though, bless your heart, she'll never set eyes on it again. But you come along; you're my prisoner, and you mustn't give me the slip. Here! march in. I've unlocked the door."

Rachel stumbled wearily over the door-sill into a dark passage; and Sylvanus followed, carefully locking the door behind him, and taking out the key, which he put safely into his pocket. He left them for a minute or two in the darkness, and then he called them into a kitchen at the back, where he had already placed some food on a table.

"There, get something to eat," he said, "whilst I wash off some of my grime; it's colly rather than clean soot, and takes a deal of time, so you get a good meal while I'm at it. Then we'll go up to mother, and hear what she says."

He went away, but Rachel could not eat anything. Her hunger had passed into a sick faintness. But she gave Rosy some food, and held her closely whilst she was eating it with unsatisfied appetite. There was a low fire smouldering in the grate, and the steam rose from her worn-out boots as she put them near to its warmth. In a half dream she went through all her prison life again, with its unbroken sameness and its long, solitary hours, until she felt the old ungovernable longing to break out, to scream and cry aloud, and to dash the things about her into pieces. If it had not been for Rosy, and the fear she had of alarming her, she could not have kept herself still and quiet, sitting motionlessly before the fire, with her eyes watching the flicker of its flames.

After a long time, hours it seemed to her, Sylvanus Croft returned from the back kitchen, where all the while she had heard vaguely the sounds of washing and brushing. She looked up at his face eagerly, for he held her future in his hands. To her surprise, it was the face of a man just bordering upon old age. His hair was thin and grey, and there was a network of wrinkles about the corners of his eyes and mouth. There was hardly any trace of his employment about him, and he had put on a clean linen house-jacket, which he stroked down as he looked at Rachel smilingly.

"Mother can't abide to look at me in my business suit," he said; "she were of a higher birth than me, and it were a come-down to be my wife; but she well-nigh forgot that she married below her. But come! you haven't ate anything? How's that? Isn't there anything you like?"

"I want to know what you're going to do with me," she answered faintly. "I can't eat anything till I know that."

"Well, well! that's natural," he said, in a pitying tone, "but it quite rests with mother. If she says you're to be let go, you are let go; and vicy versy. So come along; you and your little maid."

He took Rosy by the hand, and trod softly and slowly up the staircase, while Rachel followed, scarcely breathing for the quick throbbing of her heart. The room Sylvanus entered startled and almost frightened her, and she paused on the threshold, not venturing to take a step forward lest her soiled and tattered clothes should sully anything they touched. It was a white room; the bed-hangings and counterpane, the window-curtains and the great dimity-covered easy chair standing by the fire, were as spotlessly white as they could be in the smoke of London. Propped up with many pillows, on the bed lay a small, slight woman, in whose face there was not a shade of colour, except in the dark, piercing eyes which rested upon Rachel's miserable figure. She felt in an instant how lost and degraded she must appear to those eyes. Her blue gown had been drenched through and through again with the winter's snow and rain; and her bonnet had neither shape nor colour left, while the hair beneath it was tangled and rough. Rosy looked a little vagrant, dirty, and forlorn, and castaway.

"Oh!" cried Rachel, stretching out her hands beseechingly to the white, quiet face turned towards her, "I'm a wicked woman; but I meant to be good. I meant never to steal again, and if it hadn't been for Rosy——"

Her voice faltered and broke into sobs; and for a minute or two a deep silence fell upon them all, which seemed terrible to Rachel. She could hear nothing but the clock ticking on the mantelpiece, but at last the quick and eager tone of a woman's voice reached her ear.

"Bring her into the room, Sylvanus," said the voice, "and put her to sit down in my chair beside the fire, and make some tea quickly, and let us comfort her."

"No, no," cried Rachel, "not till I've told you what I am. I only came out of Thornbury jail the last day of the old year. I'd been servant at the Hall, and I knew all their ways, and let the men into the house. My husband was one of them, and he got ten years, and is gone to Gibraltar. I've never told Rosy all about it, not till now;

"THE STORM OF LIFE."

she's such a little creature, and I'm her own mother. We've been tramping up and down London streets, and I tried to keep right, but nobody cared, and I'd spent all my money, and to-night I fell." Her words were lost again in bitter sobs; but Rosy's voice broke in, in their clear and childish tones—

"Mother isn't a wicked woman now," she said; "teacher told me she'd try to make me

bad, but she never does. I say my hymns and prayers to her; and she tells me often that God sees us all the time."

"Oh! if I'd only remembered," sobbed Rachel, "God sees us all the time! But He seemed so far off, and as if He didn't care. It's hard to believe He cares when everything goes against you. And we couldn't even die. But if you'll let us go——"

Page 78.

"Bring her in, Sylvanus," interrupted the eager, solemn voice that Rachel had heard before, "bring her in and set her in my chair, and make her welcome. Don't you see as we can be like the father that made merry and was glad, when his poor son came home? Make some tea for her, Sylvanus, and put her close by the fire, and bring her little lass here to kiss me, quickly.

Poor little lass! The same age as our Sylvie, old man."

Before she could speak again, or make any resistance, Rachel found herself seated in the white chair, and Rosy was carried quickly across the room, and laid beside the bedridden woman. The fire was stirred up, and a bright copper kettle placed carefully upon it to keep its spout and handle from

the smoke. Sylvanus Croft's mild, wrinkled face looked down kindly upon her whenever she lifted up her eyes; and she heard him calling Rosy by all kinds of pet names, as if he had known her all her life.

"Mother," he said, when Rachel had finished her tea, and the colour had come back to her cheeks and lips, and light into her eyes—"mother, there's no call for the police, is there?"

"No, Sylvanus, no," she answered.

"What's to be done with them, then?" he asked. "You've to decide everything, you know, mother, that's not in the way of my business. They are my prisoners, and I am bail for 'em. I sent word I'd keep 'em till morning, though there's no fear of 'em being asked for. There was dancing and singing in the father's house when the poor lad got home, and there'd be a bed got ready for him, as well as the rings on his fingers, and the shoes on his feet. He wasn't turned out again when the feast was over."

"No, Sylvanus," said his wife; "there's our maid's chamber empty. Let them go there; and have a good night's sleep; and to-morrow we'll see what can be done."

The maid's chamber was a low little attic at the back of the house, with a window in its gable looking over a crowd of chimney-stacks and roofs of dwellings. There was not much furniture in it, and that was very poor; yet it had an air of humble comfort and cleanliness. It was altogether a different resting-place from any Rachel had slept in for years; and it brought back to her the happy days when she had been a girl, without trouble, and untouched by crime. She sank down on her knees beside the low bed, as soon as Rosy was lying peacefully upon it, to thank God; but she could find no words to say; only deep and heavy sobs of thankfulness told Him what she meant. Then she slept as she had never slept since she had been herself a child.

THE CHEVIOT HILLS.

By JAMES GEIKIE, F.R.S.

II.

IF we draw a somewhat straight line from the town of Girvan, on the coast of Ayrshire, in a north-east direction to the shores of the North Sea near Dunbar, we shall find that south of that line, up to the English border, nearly the whole country is composed of various kinds of greywacké and shale like those rocks which have been mentioned in a previous paper as forming the basement beds of the Cheviot district. Here and there, however, especially in certain of the valleys and some of the low-lying portions of this southern section of Scotland, one comes upon small isolated patches and occasional wider areas of younger strata, which rest upon and conceal the greywackés and shales. Such is the case in Teviotdale, the Cheviot district, and the country watered by the lower reaches of the Tweed, in which regions the bottom beds are hidden for several hundreds of square miles underneath younger rocks. Indeed, the greywacké and shale form but a very small portion of the surface in the Cheviots, appearing upon a coloured geological map like so many islands or fragments, as it were, which have somehow been detached from the main masses of greywacké of which the Lammermuirs and the uplands of Dumfries and Selkirk shires are composed. Although the

bottom rocks of the Cheviot Hills are thus apparently separated from the great greywacké area, yet there can be no doubt that they are really connected with it, the connection being obscured by the overlying younger strata. For if we could only strip off these latter, if we could only lift aside the great masses of igneous rock and sandstone that are piled up in the Cheviot Hills and the adjoining districts, we should find that the bottom upon which these rest is everywhere greywacké and shale. In part proof of this it may be mentioned that at various places in those districts which are entirely occupied with sandstone and igneous rock, the streams have cut right down through the younger rocks so as to expose the bottom beds, as in the Jed water at Allars Mill. Again, when we trace out the boundaries of any detached areas of greywacké we invariably find these bottom beds disappearing on all sides underneath the younger strata by which they are surrounded. One such isolated area occurs in the basin of the Oxnam water, between Littletonleys and Bloodylaws, a section across which would exhibit the general appearance shown in the accompanying diagram (Fig. 5). Another similarly isolated patch is intersected by the Edgerston Burn and the Jed Water between

Paton Haugh and Dovesford. But the largest of these detached portions appears, forming the crest of the Cheviots, at the head of the River Coquet. There the basement beds occupy the watershed, extending westward, some three or four miles, as far as the sandstones of Hungry Law, while to the north and

Fig. 5.—Section across greywacké area of Oxnam water. G, greywacké and shale; C, sandstone, &c.

east they plunge under the igneous rocks of Brownhart Law and the Hindhope Hills. Now it is evident that all those detached and isolated areas of greywacké and shale are really connected underground, and not only so, but they also piece on in the same way to the great belt of similar strata that stretches from sea to sea across the whole breadth of Scotland. Indeed, we may observe in the Cheviot district how long and massive promontories of greywacké jut out from that great belt, and extend often for miles into the areas that are covered with younger strata, as for example in the Brockilaw and Wolfelee Hills. A generalised section across the greywacké regions of the Cheviot Hills would therefore present the appearances shown in the annexed diagram, in which G represents

Fig. 6.—Diagram section across greywacké districts of Cheviot Hills.

that gather in calm reaches of the sea, such as estuaries, betokening the presence of some not distant land from which fine mud and sand were washed down. Another proof that some of the strata at all events were accumulated not far from a shore line, is found in certain coarse bands of grit and pebbles, which are not likely to have been formed in deep water. This evidence, however, cannot be considered decisive, and in the present state of our knowledge all that we can assert with anything like confidence is simply this:—that during the deposition of the Silurian strata the whole of the Cheviot area lay under water,—existed, in short, as a muddy sea-bottom, in the slime of which flourished here and there, in favourable spots, those minute Hydroid animals called *graptolites*.

Between the deposition of the Silurian and the formation of the rocks that come next in

the basement beds, the igneous rocks, and the red sandstones, &c.

Throughout the whole of the district under review the bottom beds are observed to dip at a high angle—the strata in many places being actually vertical—and the edges or crops of the strata run somewhat persistently in one direction, namely, from south by west to north by east; or, as a geologist would express it, the beds have an approximately south-west and north-east “strike.” Now as the dip is sometimes to north-west and sometimes to south-east, it is evident that the rocks have been folded up in a series of rapid convolutions, and that some of the beds must be often repeated.

From the character of the fossils which the bottom beds have yielded we learn that the strata belong to that division of past time which is known as the Silurian age. These fossils appear to be of infrequent occurrence, and the creatures of which they are the relics occupied rather a humble place in the scale of being. They are called *graptolites* (from their resemblance to pens), an extinct group of Hydroid zoophytes, apparently resembling the scutellarians of our own seas.

The general appearance of the Silurian strata of the Cheviots is indicative of deposition in comparatively quiet water, but how deep that water was one cannot say. Upon the whole, the beds look not unlike the sediments

order a long interval elapsed, during which the mud, sand, and grit that gathered on the floor of the ancient sea were hardened into solid masses, and eventually squeezed together into great folds and undulations. It has already been pointed out that these changes could hardly have been effected save under extreme pressure, and this consideration leads us to infer that a great thickness of strata has been removed entirely from the Cheviot district, so as to leave no trace of its former existence. Long before the deposition of the younger strata that now rest upon and conceal the Silurian rocks, the action of the denuding forces—the sea, frosts, rain, and rivers—had succeeded in not only sweeping gradually away the strata underneath which the bottom beds were folded, but in deeply scarping and carving these bottom beds themselves. Can we form any reasonable conjecture as to the

geological age of the strata underneath which the bottom beds of the Cheviots were folded, and which, as we have seen, had utterly disappeared before the younger rocks of the district were accumulated? Well, it is obvious that the missing strata must have been of later formation than the bottom beds, and it is equally evident that they must have been of much more ancient date than the igneous rocks of the Cheviot Hills. Now, as we shall afterwards see, these igneous rocks belong to the Old Red Sandstone age, that is to say, to the age that succeeded the Silurian. How is it then, if the bottom beds be really of Silurian and the igneous rocks of Old Red Sandstone age, that a gap is said to exist between them? The explanation of this apparent contradiction is not far to seek. When we compare the fossils that occur in the Silurian strata of the Cheviot Hills and the districts to the west, with the organic remains disinterred from similar strata elsewhere, as in Wales for example, we find that the bottom beds of the Cheviots were in all probability accumulated at approximately the same time as certain strata that occupy a very low horizon or position in the great Silurian system. In Wales and in Cumberland the strata that approximate in age to the Silurian of the Cheviots are covered by younger strata belonging to the same formation which reach a thickness of many thousand feet. It may quite well be, therefore, that the succession of Silurian strata in the Cheviots was at one time much more complete than it is now. The upper portions of the formation which are so well developed in Wales and Cumberland, and which are likewise represented to a small extent here and there in Scotland, had in all probability their equivalents in what are our border districts. In other words, there are good grounds for believing that the existing Silurian rocks of the Cheviots were in times preceding the Old Red Sandstone age more or less thickly covered with younger strata belonging to the same great system. The missing Silurian strata of the Cheviots may have attained a thickness of many thousand feet, and underneath such a mass of solid rock the lower-lying strata might well have been consolidated and subsequently squeezed into folds. And if, as is by no means improbable, the sea deeply covered the Cheviot area during the slow subsidence of the earth's crust that gave rise to the lateral squeezing and folding of the strata, then the pressure of the water would be added to the weight of the descending rocky mass underneath which the bottom beds suffered plication.

We now pass on to consider the next chapter in the geological history of the Cheviot Hills. As we proceed in our investigations it will be noticed that the evidence becomes more abundant, and we are thus enabled to build up the story of the past with more confidence, and with fuller details. For it is with geological history as with human records—the further back we go in time the scantier do the facts become. The rocks upon which Nature writes her own history are palimpsests, on which the later writing is ever the most easily deciphered. Nay, she cannot compile her newer records without first destroying some of those compiled in earlier times. The sediments accumulating in modern lake and sea are but the materials derived from the degradation of the solid rocks we see around us, just as these in like manner have originated from the demolition of yet older strata. Thus the further we trace back the history of our earth, the more fragmentary must we expect the evidence to be; and conversely, the nearer we approach to the present condition of things the more abundant and satisfactory must the records become. Accordingly, we find that the igneous rocks of the Cheviot Hills tell us considerably more than the ancient Silurian deposits upon which they rest. The surface of the latter appears to be somewhat irregular underneath the igneous rocks, showing that hills and valleys, or an undulating table-land, existed in the Cheviot district prior to the appearance of the younger formation. But before we attempt to summarise the history of that formation, it is necessary to give some description, however short, of the rocks that compose it.

These consist chiefly of numerous varieties of a rock called porphyrite by geologists, piled in more or less irregular beds, one on top of another, in a somewhat confused manner. The colour of the freshly fractured rocks is very variable, being usually some shade of blue or purple; but pink, red, brown, greenish, and dark grey or almost black varieties also occur. Some of the rocks are finely crystalline; others, again, are much coarser, while many are compact, or nearly so, a lens being required to detect a crystalline texture. The mineral called felspar is usually scattered more or less abundantly through the matrix or base, which itself is composed principally of feldspathic materials. Besides distinct scattered crystals of felspar, other minerals often occur in a similar manner; mica and hornblende being the commonest. Occasionally the rocks

contain numerous circular, oval, or flattened cavities, which are sometimes so abundant as to give the appearance of a kind of coarse slag to the porphyrite. These little cavities, however, are usually filled up with mineral matter—such as calcspar, calcedony, jasper, quartz, &c. Sometimes, also, cracks, crannies, and crevices of some size have been sealed up with similar minerals. Now nearly all these appearances are specially characteristic of rocks which have at one time been in a state of igneous fusion; nor can there be any doubt that the Cheviot porphyrites are merely solidified lava-beds, which have been poured out from the bowels of the earth. In modern lavas we may notice not only a crystalline texture, but frequently also we observe numerous little cavities similar in shape and appearance to those in our porphyrites. Such cavities are due to the expansive force of the vapours imprisoned in the molten mass at the time of eruption. They form chiefly towards the upper surface of a lava stream, and are often drawn out or flattened in the direction in which the lava flows. Thus a stream of lava, as it creeps on its way, becomes slaggy and scoriaceous or cindery above and in front, and as the molten mass within continues to flow, the slags and cinders that cover its face tumble down before it, and form the pavement upon which the stream advances. In this way slags and cinders become incorporated with the bottom of the lava, and hence it is that so many igneous rocks are scoriaceous, as well below as above. The vapours which produce the cavities usually contain minerals in solution, and these, as the lava cools, are frequently deposited, partially filling up the vesicles, so as to form what are called geodes. But many of the cavities have been filled in another way—by the subsequent infiltration of water carrying mineral matter in solution. And since we know that all rocks are so permeated by water, it is clear that the cavities may have received their contents during many successive periods, after the solidification of the rock in which they occur. It is in this manner that the jaspers, calcedony, and beautiful agates of commerce have been formed. Rocks abundantly charged with cavities are said to be *vesicular*, and when the vesicles are filled with mineral matter, then the mass becomes, in geological language, *amygdaloidal*, from the almond-like shape assumed by the flattened vesicles.

Now all the appearances described above, and many others hardly less characteristic of

true lavas, are to be met with amongst those porphyrites which, as I have said, form the major portion of the Cheviot Hills. From the valley of the Oxnam, east by Cessford, Morebattle, and Hoselaw, and south by Edgerston, Letham, Browndeanlaws, and Hindhope, the porphyrites extend over the whole area, sweeping north-east across the border on to the heights above the rivers Glen and Till. In the hills at Hindhope we notice a good display of the oldest beds of the series. At the base we find a very peculiar rock resting upon the Silurian, and thus forming the foundation of the porphyrites. It varies in colour, being pink, grey, green, red, brown, or variously mottled. Sometimes it is fine-grained and gritty, like a soft, coarse-grained sandstone; at other times it is not unlike a granular porphyrite; but when most typically developed it consists of a kind of coarse angular gravel embedded in a gritty matrix. The stones sometimes show distinct traces of arrangement into layers; but they are often heaped rudely together with little or no stratification at all. They consist chiefly of fragments of porphyrites; but bits of Silurian rocks also occur amongst them. This peculiar deposit unquestionably answers to the heaps of dust, sand, stones, and bombs, which are shot out of modern volcanoes; it is a true ash—that is, a collection of loose volcanic ejectamenta.

Upon what kind of surface did it fall? Long before the eruptions began, the Silurian rocks had been sculptured into hills and valleys by the action chiefly of the sub-aërial forces, and it was upon these hills and in these valleys that the igneous materials accumulated. It is difficult to say, however, whether at this period the Cheviot district was above or under water. The traces of bedding in the ash would seem to indicate the assorting power of water; but the evidence is too slight to found upon, because we know that in modern eruptions loose ejectamenta frequently assume a kind of irregular bedded arrangement. For aught we can say to the contrary, therefore, dry land may have extended across what is now southern Scotland and northern England when the first rumblings of volcanic disturbance shook the Cheviot area. Be that as it may, we know that the volcanic outbursts began in those old times, as they almost invariably commence now, by a discharge of sand, small stones, and blocks of scoriæ. These, we may infer, covered a wide area round the centre of dispersion—the

chief focus of eruption being probably somewhere near the big Cheviot. The locality where the ash occurs is some nine miles or so distant from this point, and the intervening ground could hardly have escaped being more or less thickly sprinkled with the same materials. The whole of that intervening ground, however, now lies deeply buried under the massive streams of once-molten rock that followed in succession after the first dispersion of stones and débris. Although, as I have said, it may be doubted whether at the beginning of their activity the Cheviot volcanoes were subaqueous, yet there are not a few facts that lead to the inference that the eruption of the porphyrites took place for the most part, if not exclusively, under water. The beds are occasionally separated by layers of well-stratified sand and grit and stones; but such beds are rare, and true ashes are rarer still. If the outbursts had been sub-aërial, we ought surely to have met with these latter in greater abundance, while we should hardly have expected to find such evidently water-arranged strata as do occur here and there. The porphyrites themselves present certain appearances which lead to the same conclusion. Thus we may observe how the bottoms of the beds frequently contain baked or hardened sand and mud, showing that the molten rock had been poured out over some muddy or sandy bottom, and had caught up and enclosed the soft, sedimentary materials, which now bear all the marks of having been subjected to the action of intense heat. Sometimes, indeed, the old lava-streams seem to have licked up beds of unconsolidated gravel, the water-worn stones being now scattered through their under portions. As no fossils occur in any of the beds associated with the porphyrites, one cannot say whether the latter flowed into the sea or into great fresh-water lakes. Neither can we be certain that towards their close the eruptions were not sub-aërial. They may quite well have been so. The porphyrites attain a thickness of probably not less than fifteen hundred feet or two thousand feet, and the beds which we now see are only the basal, and therefore the older portions of the old volcanoes. The upper parts have long since

disappeared, the waste of the igneous masses having been so great that only the very oldest portions now remain, and these, again, are hewn and carved into hill and valley. Any loose accumulation of stones and débris, therefore, which may have been thrown out in the later stages of the eruptions must long ere this have utterly disappeared. We can point to the beds which mark the beginning of volcanic activity in the Cheviots; we can prove that volcanoes continued in action there for long ages, great streams of lava being poured out—the eruptions of which were preceded and sometimes succeeded by showers of stones and débris; we can show, also, that periods of quiescence, more or less prolonged, occasionally intervened, at which times water assorted the sand and mud, and rounded the stones, spreading them out in layers. But whether this water action took place in the sea or in a lake we cannot tell. Indeed, for aught one can say, some of the masses of rounded stones I refer to may point to the action of mountain torrents, and thus be part evidence that the volcanoes were sub-aërial. If we are thus in doubt as to some of the physical conditions that obtained in the Cheviot district during the accumulation of the porphyrites and their associated beds, we are left entirely to conjecture when we seek to inquire into the conditions that prevailed towards the close of the volcanic period. For just as we have proof that before this period began the Silurian strata had been subjected to the most intense denudation—had, in short, been worn into hill and valley—so do we learn from abundant evidence that the rocks representing the old volcanoes of the Cheviots are merely the wrecks of once-extensive masses. Not only have the upper portions of these volcanoes been swept away, but their lower portions, likewise, have been deeply incised, and thousands of feet of solid rock have been carried off by the denuding forces. And by much the greater part of all this waste took place before the accumulation of those sandstones which now rest upon the worn outskirts of the old volcanic region, as I shall endeavour to show in another paper.

ST. MICHEL.

VII.

FROM what has been said, the reader will infer that the granite pile of civil, military, and ecclesiastical buildings which now meets the eye belongs to widely different ages. Portions of the immense crypt and the Norman church above it, on the site of St. Aubert's basilica, date back to 1023, when Duke Robert of Normandy, who came to the mount to be married to Judith, daughter of Geoffrey of Bretagne, assisted by Abbot Hildebert II., laid the plan of a vast Norman edifice which, under the Benedictines, received various additions, two western towers, by De Torigny, in the twelfth century, central tower and spire of same date, and at a later period a flamboyant Gothic chancel of the fifteenth century.

The ring of walls and fortifications, as we now see them restored in M. Corroyer's splendid drawings (engravings of which we give) but partially ruined in reality, are chiefly the work of the warrior abbot, Robert Jolivet, 1417, and the famous Captain (afterwards Cardinal) Estouteville, assisted by the monk Gonault, who was himself a great warrior abbot, and one of the chief builders of the Mount.

The monastery, which occupies a vast rectangular space, is flanked on the west by immense perpendicular walls, and bordered on the other side by huge ramparts and terraces admirably devised both for defence and attack. The whole mass of towers and halls, from the centre of which springs the basilica to a giddy height, though by different hands, still possess a singular unity. Those on the north side were built chiefly by Radulphe de Iles, 1212, and Raoul de Ville-dieu, 1236; they are commonly known as Les Merveilles, and indeed are miracles of construction. Robert de Torigny, 1154—86, and Pierre le Roy, 1386—1410, are amongst the greatest contributors to the monastic buildings, although almost every one of the abbots left his mark, in addition or repair of some kind.

Eleven times has the Mount with its venerable buildings been visited by fire, sometimes by lightnings, sometimes by mischance, and sometimes by the hand of the enemy. Twice the central tower was smitten down, and the bells melted; and so shaken had a portion of the fabric become in the middle of last century, that a quarter

of the Norman church, including De Torigny's grand towers and west portal had to be taken down to preserve the remainder.

VIII.

I shall not attempt to describe in detail the grand abbatial staircase that leads into the vestibule, and thence by a series of massive flights straight up to the Norman nave, or the noble hall of the knights, or the vast crypts that still contain thousands of human bones, and have been utilised at various times as prisons, wine-cellars, and even cisterns.

Volumes might be written upon the "Merveilles" and the various chapels under and above ground, describing them as they were, and as they are, alas, now; but before I turn to the darkest page in the history of St. Michel, I will ask the reader to join yonder band of joyous pilgrims who have been waiting so patiently at Ardevon and Moidrey for the tide to go out. It is true we must travel back at least as far as the beginning of the sixteenth century; but it is worth while, for across the sands the sweet bells invite the throng of pilgrims to the angelic shrine as the golden statue of St. Michael on the summit of the lofty spire turns and flashes in the morning sun.

Before the dismal wreck of 1793 let us take one more look at the mountain in its glory, and catch a flying glimpse of those priceless treasures so soon to be irrevocably scattered or destroyed.

IX.

The Christmas bells have rung in the last year of the troubled fifteenth century. The snow, which had fallen heavily in great flakes from tower and rampart, had floated away like miniature icebergs on the swift tides, and the wind that stirred in the budding orchards were soft and warm with the spring.

St. Michel's nine sweet bells sent forth their sound across the shining sands, and St. Michel's cannon pealed out with solemn joy to herald in the day of the Great Pilgrimage of 1499.

There is a stir in the little hostelries at the foot of the Mount. The pilgrims arrived over night are up at day dawn. Let us, too, ascend the ramparts. The sands are hard and dry, streams of people are coming towards the town. Their white and crimson or azure banners held aloft, mark

off the successive companies. Here come a troop of women, with bare feet, beating cymbals and little drums, and followed by their lords on horseback. Yonder are Bretons and Normans who, by a curious law, are not allowed to inherit until a visit to the great Mount has been made. Young couples on their wedding pilgrimage, a band of soldiers with glittering lances and pikes, an immense number of Germans—"De Almannis altis et bassis et de Brabantia tam magna copia ut vix per vias victualia invenire possent"—from Le Mans, Barenton, Avranches—Poitevins, Gascons, Spaniards, a never-ending troupe.

The sands become more crowded with pilgrims as the tide begins to turn. Some fall on their knees on seeing the distant sea—then, barefooted, they prepare to cross, and we catch, as they come, the deep male chorus, and the shrill, sweet voices of girls—

"Anges qui donnez les mains
Aux humains,
Aux cours de nos voyages,
Soyez toujours mon support
Jusqu'au port
De ce mien pèlerinage!"

Two rows of armed men in burnished coats-of-mail, with helmets and halberts, line the approach to the monastery. The doors are thrown open, disclosing the hall, and beyond the continuation of the grand abbatial staircase, and the motley and many-coloured throng of joyous pilgrims begins to move upwards. They reach the lofty platform of Beauregard—also lined with rows of flashing knights in coat-of-mail, and halberdiers—the north door stands wide open, and the strains of the processional hymn uprise as the brilliant company of priests and acolytes is seen advancing with the prelate, Jean de Lampe, in their midst. A solemn silence of hushed awe pervades the kneeling crowd as a priest advances at the head of the procession, lifting on high the great vermillion cross of Robert Jolivet, 1410. The silver censers belonging to the same great abbot are being swung aloft, exhaling white clouds of aromatic smoke; then follow boys in scarlet, with tall golden candlesticks, then a band of priests, with red velvet capes, interwoven with golden fruit and flowers, the elder ones follow with white damask capes, embroidered with coloured flowers and the arms of Abbot Guillaume de Lampe. Then comes the leader of the choir with a silver mace, the dean and sub-dean, in white satin and gold, and, lastly, the illustrious prelate Jean de Lampe, who blesses the kneeling multitude. De Torigny's own chasuble is on his back,

his head is crowned with the richly-jewelled mitre of Richard Toustain, 1236, and he holds the pastoral staff of the Abbot Jolivet, 1400, who built the ramparts still standing. As he approaches the high altar, and turns his back upon the crowded nave, his eye lights upon the splendid missal of Pierre le Roy, 1386, and presently kneeling down, he raises above his head the golden chalice of the Abbot Suppon, 1033.

X.

The "Treasure," or collection of relics and sacred ornaments of St. Michel, was one of the most celebrated in the world, for emperors and kings for centuries vied with each other in enriching its altars, niches, and sepulchres. As the vast congregation pours out of the basilica, detachments are quickly organized by the brothers, to visit in succession the "reliquaries." Here lies the body of St. Aubert himself, 708, on a damask couch, beneath a silver vault—the bones are tied together with silver threads. Yonder, in a special casket of silver, is his skull, still bearing the mark of the angel's finger on the left side. Several bodies of other saints are shown—coals from the furnace of St. Lawrence, martyr; a solid golden statue of St. Michael, given in 1461 by Louis XI.; solid silver crosiers of the twelfth century, with solid golden statuettes wrought upon them; thirteenth-century mitres, rich with gems; pure golden chalices for sacramental wine, of the thirteenth century; and splendid shrines richly chased in gold and silver, ornamented with ivory, lapis, and porphyry, and disposed in the various chapels; but perhaps what most excites the veneration of our simple pilgrims is the famous black Virgin in the crypt, of unknown antiquity, but mentioned as early as the tenth century. The miracles wrought by her in the dim light of those profusely painted vaults, are duly recorded in the annals of the Mount, and even now it is impossible to enter that strange, bare, and despoiled underground sanctuary, with its thirteen low granite columns of immense thickness, standing all round and crowded close together, without a feeling of awe, and an impression that anything in the world might happen in such a weird place—*there*, on the very spot occupied by the ancient Christian church, which, again, was the site of the Roman fane, and, lastly, of the great Druid rocks, rolled down by a child through the help of the archangel himself!

Of the crowd of other vastly apocryphal relics, enclosed in splendid coffer or silver

shrines, I need hardly speak, nor need we regret the disappearance, for the most part, of such impostures as the sacred thorns from the Saviour's crown, the Virgin Mary's hair, the teeth of St. Nicholas, or the bones of Shadrach, Meshach, and Abednego!

But the day draws to a close, the advancing tide warns the lingering pilgrims to hasten back, the setting sun bathes the wide sky with purple and orange splendour, and flashes like red gold upon the granite slopes of the embattled Mount. And now from the crowded sands come fainter and fainter the voices from below, as the shadows of the monastery deepen and lengthen upon "La

Grève," and the tired monks lean from rampart and tower to listen to the pilgrim refrain:—

"Adieu donc Tombelaine
Et Saint Michel du mont
Adieu donc!"

XI.

Gladly would I hurry over the prodigious fall and ruin of St. Michel. Its day of terror came when France lay prostrate before that bloody Revolution which was hailed in so many quarters as the dawn of Reason's age and the great moral resurrection of the world! In 1789 the French National As-

Plan of Restoration of Mont St. Michel, East face.

sembly abolished all ancient privileges, confiscated all ecclesiastical property, and the next year suppressed the religious orders. Corrupt they undoubtedly were, though not so corrupt as they had been, and at St. Michel, at all events, there were still schools, teachers, learned writers, and brave men who shrank not from the crown of martyrdom. But the hour had struck. The monks were, with scarcely a warning, turned out of their ancient halls penniless. On that dark day they knelt once more and for the last time in their beloved and sumptuous basilica, already half despoiled, paced the halls of the Merveilles, descended the abbatial staircase, then out upon the sands robbed of everything they possessed, some with only

XVII—7

a few books in a bag, others with merely the clothes upon their backs. They went forth scarcely knowing whither; they had no home, no friends, no country.

On the mainland persecution awaited them; few took the oaths of the new patriotism; few obeyed the order not to celebrate mass; they were thrown into noisome prisons to starve; they were hunted from hovel to hovel, and shot down in the streets.

But we must return for a moment to the devoted mountain, when the last priest had left the monastery, and the halls of the Merveilles stood open and empty. Then was seen a terrible sight. The demon of revolution was stirring in the little town itself; a mob climbed the rock, entered the deserted

halls; rifled the cupboards; laid sacrilegious hands on the silver and gold ornaments; overthrew the altars; broke the statues; burst open the sacred tombs, and scattered the bones of saints and martyrs on the pavement. Even the skull of St. Aubert was only saved later by one Doctor Cousin, who took it to his room to examine. The reckless rapine was only stopped by the arrival of Government troops; but the Government excesses were nearly as bad. The gold and silver was, indeed, secured, some of the MSS. were transferred to Avranches; but the magnificent stained glass of the thirteenth and fourteenth centuries, containing much of the pictorial history of the Mount in its great days, was deliberately smashed, none of it remaining. Wall decorations, carvings, and pictures shared the same fate, and later on all the splendid oak furniture and fittings, including the gorgeous choir stalls of Pierre le Roy, were sold to pay for the cost of turning the place into a prison. Into this prison many priests were thrown to die. But the prison itself was a wreck. Nothing was respected, not the black Virgin, nor the crypt, nor the ancient hall of the knights, nor the basilica. Stucco walls and ramshackle floors were run up dividing the dormitories, the knights' hall, and even the nave of the church into workshops for the prisoners, whom Napoleon I. thrust in there to linger and die upon what had once been proudly called the "Free Mount." Every year saw some new disfiguration. Torigny's noble towers and west front and a quarter of the Norman nave had to be taken down; the ancient dormitory or Salle Souvré, also disappeared; what remained was barbarously cut up into sections; frescoes and rich decorations were covered with whitewash, and the pictures sold.

Disaster at last reached a climax in the great fire which broke out in the basilica in 1834. The roof fell in; the whole church was injured; the splendid pulpit, full of antique carving, for which a fabulous price had been declined shortly before, was burned; it was almost the last great relic to go, and now as we walk in imagination amongst the calcined ruins of so much splendour, and look down upon the rock and the sands alone unchanged amidst the universal ruin—the lowest depth is at length reached, and sadly prophetic seems the pilgrim's song:—

"Adieu donc Tombelaine,
Et Saint Michel du mont,
Adieu donc!" . . .

XII.

But a change is at hand. The darkest hour before dawn is already past. Under Napoleon III. the Mount receives back her abbot and her monks, and the work of reconstruction begins. Once more the hostelries of the little town are crowded with visitors, and the sound of mallet and saw are heard upon the ramparts, as the new scaffolding rises against the jutting rock.

Marshal Macmahon has pushed on the work, and we are indebted to Mons. Corroyer, the Government architect, to whom has been entrusted the whole reconstruction of the place, for the splendid drawings (sketches of which we reproduce), and the special information which here follows.

In 1873, M. Corroyer's drawings received the gold medal at the Paris Salon. In the same year he was employed by the Commission of Historical Monuments in France, to design a scaffolding and superintend immediate repairs. No carts could carry the heavy beams to the rock over the yielding sands; the whole was thrown upon the tidal current and with great risk floated across to the Mount.

A glance at the drawings we present will tell better than pages of description, the boldness and importance of the projected restorations.

The underground crypts have to be strengthened, the fortifications and towers restored, and the Norman nave (including De Torigny's towers, north and south) and the lofty spire rebuilt; but the Government votes an annual supply, the enthusiasm of Normandy is fully aroused, hundreds of visitors throng the venerable pile every week, each paying a tribute of one franc, and the work goes on rapidly under the personal inspection of M. Corroyer and his able assistant, M. Morand.

XIII.

It was early in the month of September, 1875, that I found myself seated in the little inn of St. Michel, so charmingly presided over by a young married hostess, Madame Poulard, possessed of every feminine grace, through whose amiability I soon became acquainted with M. Morand, architect, who, in the absence of M. Corroyer, was superintending the works.

A few days previously it appears, whilst digging in the old platform at the west end of the Norman church, close to the place where one of De Torigny's towers had stood, they came upon the body of the abbot him-

self. No one was admitted to see his remains, which were at first in a perfect state of preservation, but on telegraphing to M. Corroyer, I obtained that permission, and wrote a detailed description of what I saw in the *Times* of September 17, 1875, and perhaps I may be pardoned if I briefly repeat here what was there told at considerable length.

Standing on the old platform of the west nave, and turning from the *débris* of the tower, I approached the grave, which was covered over with a rough sail-cloth. We lifted it; a stone coffin-lid split in half covered the niche. We lifted that, and the hot September sun smote in full upon all that was left of the great man before whom kings and turbulent knights once trembled.

When he was first uncovered, he lay complete, wrapped in one long simple robe of apparently fine linen, a silken wrapper of some kind being swathed round his body. He wore great leathern shoes, part of which remain. His skull, of vast dimensions, was broken in twain, but his lower jaw is complete, with all his teeth perfect save one. He was eighty years old. He measured five and a half feet. He wore no ring, but a leaden crosier with its wooden handle lay beside him; the wood went to pieces almost immediately.

The bones seemed to me much broken and oxidized. They say that he was embalmed, but of this I could find no trace. Several bands and ribands were quite recognisable, though rotten; but a large leaden medallion with the following inscription was well preserved:—"Hic. Requiescit. Robertus. De. Torigneio. Abbas. Hujus. Loci (a hand held up blessing) A. Ω (on the other side:) Qui. Prefuit. Huic. Monasterio. xxxii. Annis. Vixit. Vero. lxxx. Annis."

In a tomb by his side lies the body of his successor, Martin de Furmedeio. His bones are more complete, but not a particle of his vestments remains—only his crosier and medal. He was buried in a wood coffin; the great abbot lay simply in a granite niche.

I expressed a hope, in which I believe that Cardinal Manning has since joined, that de Torigny, or "Robert of the Mount," as he is usually called, might be permitted to rest where he has lain since the year 1186, as appears from the date on the round leaden medal found beside him, and engraved below. The good brothers of the monastery, especially the reverend Father Hamelin, warmly agreed with me that to remove the remains, as at first projected, to a new shrine, would be a fatal mistake, for there in their simple granite niche can they alone boast of authentic and perfect historical continuity.

* * * * *

The shell-gatherers had come in; the sound of the returning tide was borne upon the evening breeze as I drove out of the old gateway on to the dry sands, and dashed into the already swollen current of the thin stream that never dries between sea and sea.

The low sun sank; the white birds fled; the long blue shadows of the Mount crept over the sand, and the roar of the tide grew louder and louder as my driver urged forward our galloping steeds. I turned to take a last look at the shrine of the great archangel:—

"Adieu donc Tombelaine,
Et Saint Michel du mont,
Adieu donc!" . . .

H. R. HAWEIS.

Epitaph of Robert de Torigny.

CHANGING GUIDES.

A LONG the road the travellers go,
 A motley cavalcade;
 At midnight, 'midst fast falling snow,
 The march awhile is stayed.

And great and small, and one and all,
 Hot youth and lagging age,
 They gather waiting round the stone
 Which marks another stage.

The journey's done, the stage is run,
 The Guide must say farewell.
 (Hark! down the wind the travellers deem
 They hear a passing-bell.)

A stage behind, when wailed the wind
 Across a snowy wold,
 They halted, and they halt this night,
 Upon a midnight cold,

Till this same Guide, who stands beside
 The stone, now midnight's near,
 Came, muffled—none his face could see,
 And none his voice could hear.

If he were glad, if he were sad,
 Not one of them could know;
 But ever as they went along
 His veil he lifted slow.

If he were sad, if he were glad,
 If he brought good or ill,
 They did not know; but, day by day,
 He told his tale; and still,

Some called it sad, some said 'twas glad—
 So wondrous was the tale.

Each saw him as none other saw,
 Who looked behind his veil.

The stage is run, the tale is done,
 The Guide must say farewell—
 And on the wind there comes the sound
 As of a passing-bell.

Now he must go; the winds wail low
 Across the snowy wold;
 He takes each traveller by the hand—
 His hand is very cold.

Of one and all, both great and small,
 How loth soe'er they be,
 Whatever's false of all they have,
 He claims it for his fee.

They plead in vain, for, loth or fain,
 They thus his fee must pay;
 But nothing that was truly theirs
 The guide can take away.

And when he goes none ever knows;
 Their grasp is strong and warm—
 They think they hold him still—but he
 Is whirling down the storm.

Ere they can say, "Farewell for aye!"
 Far down the storm he's gone.
 The new Guide stands with muffled face
 Beside the halting-stone.

At midnight thus the cavalcade
 Is halted on the plain.
 When midnight's past, to meet the morn
 The march sets forth again.

MARY A. M. HOPPUS.

LITERATURE OF THE PEOPLE—PAST AND PRESENT.

THE question of how far within a given time, and upon a definite area, the literature of the common people has improved or deteriorated, is a question of very great interest and importance. For, just as those who form the mass of the community read, where they do read at all, mainly without system, to gratify natural taste, or an easy curiosity, and not in any measure to further some predetermined end which they have resolved to reach, by a certain sacrifice, if necessary, so will the literature in active use amongst them be, all the more certainly, a true and reliable index to both their moral and mental habits and condition. We do not in this paper propose to take up the subject of the literature of the people generally; neither shall we seek to press formal conclusions of a comprehensive character. With a view to illustrate the course of recent popular literature in one of its phases, we simply select for brief comment and review a field which has come pretty much under our own observation, confining what we have

to say for most part within the period of which personal recollection enables us to speak. Generally our remarks will apply to the state of matters among the rural and working-class population of Scotland, and will traverse a period of a quarter of a century or thereby.

A retrospect of twenty-five years brings us to the time when the newspaper press of the country was trammelled with both the stamp duty on every sheet issued, and an eighteen-penny tax on each advertisement that sheet contained. It is not with the newspaper that we have to do primarily, however; though we shall have occasion to refer to it again. But, taking the date 1850, we ask the reader to project his thoughts backward over the comparatively short intervening space of time, and endeavour to call to mind how many of those serials of a high moral and religious character that are now scattered over the land by tens of thousands, weekly and monthly, had not then come into existence. The periodical in which this paper appears, with its twin magazine; four or five

admirable serials issued by the Religious Tract Society, and numbers more of similar character, with Spurgeon's Sermons so widely disseminated—these, forming almost a distinct popular literature in themselves, were unknown then, because they were not. And what occupied their place? We would be the last to depreciate or undervalue the labours of the pioneers of a healthy and instructive secular literature for the people; the Chamberses and Knights, who did excellent service a generation ago. Their efforts were worthy of all praise; but even at its highest, the literature they produced found its readers rather among the *élite* of the common people than among the mass. And up to and even a little after the date of which we have spoken, a literature of a very much lower character was not only greatly more pervasive among the mass of casual and incidental readers, but in too many cases formed the only literature they read with sufficient zest to make it influential in their habits of thought and life. The moral tone of that literature (such as it was) was too frequently questionable, or positively bad, and nothing had come directly to counteract it. We refer to the sort known as the penny chap-books and their congeners.

The chap-book could apparently claim direct descent from the Grub Street authorship of a century and a half earlier. In touching on "the stage itinerant," in the introduction to "A Tale of a Tub," Swift informs us that under it "are couched those productions designed for the pleasure and delight of mortal men, such as Sixpenny Worth of Wit, Westminster Drolleries, Delightful Tales, Complete Jesters, and the like, by which the writers of and for Grub Street have in these latter ages so nobly triumphed over Time, have clipped his wings, pared his nails, filed his teeth, turned back his hour-glass, blunted his scythe, and drawn the hob-nails out of his shoes." Among the other veritable productions of Grub Street named by the great satirist, whose object was to draw into uncomplimentary contrast certain of the works of authors of equal reputation with himself, are, "History of Reynard the Fox," "Tom Thumb," "Dr. Faustus," and "The Wise Men of Gotham." The greater part of the real Grub Street productions enumerated by Swift continued to be well known as chap-books throughout the first half of the present century. And they were largely supplemented by others of later date, regularly issued for many years from more than one press in Scotland.

The chap-books might be roughly divided into three classes. The first, and by much the smallest class, consisted of those which may be supposed to have had, more or less, a religious aim. The second class included historical or biographical sketches, and abridgments of classical tales and legends. The third class dealt with imaginary characters, or with real characters treated in an imaginative way, according to the taste and fancy of the original compiler; and their purpose generally was to excite mirth and wonder, or it might be emulation. Founding our criticism on a representative collection before us, the first objection that lies against the whole (by comparison) is their wretched style and appearance. The paper and typography are very inferior; and where illustrations are attempted, they are usually miserable specimens of art. A slight examination shows, moreover, that the same rude woodcut block had frequently to do double service in being used to illustrate totally diverse subjects. But, waiving all that, a more essential objection is found in the meagreness and frequent inaccuracy that characterize the contents. Occasionally, to meet a taste which has never ceased to be characteristic of Scotland, we find a famous sermon by some noted Evangelical divine, but evidently incomplete, and the abridgment done with little regard to consecutiveness in the thought or argument. And in a similar way one or two biographies of religious worthies of a former time exhibit so little of literary skill and care in the compilation, that the reader has no chance of forming a proper conception of the characters meant to be depicted. The same literary defects too often marked chap-books of the second class; the matter was meagre, and the proportion of parts bad. These were slight faults, however, compared to the more serious objection that lay against the third class of chap-books of absolute, and in many cases gross, coarseness. We name but one, and not the least famous, of this class—"The History of the Witty Exploits of Mr. George Buchanan." How the chap-book writer dealt with the facts of history, and of the great Scottish scholar's life, will be understood when we read in his introduction that Buchanan "was servant or teacher to King James VI., and one of his private counsellors; but publicly acted as his fool." A number of the "exploits" of Buchanan as king's fool were represented as having been performed in London after the king's residence had been removed thither: although, as authentic history tells us,

Buchanan was dead long before James ascended the throne of England. As a chap-book the exploits of George Buchanan was by no means the coarsest of its class; yet to the extent of one-third of its contents there is such an infusion of positive coarseness and indecency as to render it utterly unfit to be read, even on the supposition that the literary merits of the other parts presented an adequate reward; which is far from being the case. In others, with even less of literary merit, directly obscene allusions formed a marked feature. Yet these chap-books were issued without stint from respectable publishing houses in Glasgow and elsewhere, up to nearly the date already mentioned; and when we bear in mind that it was this very class of broadly-offensive productions that was at once the most characteristic and the most universally read, remembered, and quoted form of literature among a very large proportion of the Scottish lower classes, both rural and urban, thirty to forty years ago, we shall be able to form a juster conception of the popular literature of the time and its educative influence. While the inoffensive chap-books might be read and remembered in a general way, the filthy jokes and coarse narrations in George Buchanan, and others of its class, were intimately known, and repeated as household words.

"Printed for the booksellers" was the usual title-page inscription on the chap-books; and the numbers on some of them indicate the issue of very long series. As matter of fact, they were chiefly vended by small pedlars, or "flying stationers." In Scotland, the pedlar was a chapman, and hence the term "chap-book." Between the flying stationer and the wandering ballad-singer there was a close affinity, though the callings were not usually combined. Whether the latter was to be taken as the degenerate representative of the minstrel of earlier times may be left undetermined here; yet even in this connection, Fletcher of Saltoun's famous saying about "a very wise man" who believed that "if a man were permitted to make all the ballads, he need not care who should make the laws of a nation," had more of profound truth and force in it than may be generally believed. Some comparatively very illiterate and obscure ballad-singers and reciters wielded an influence which we should greatly underrate were we to estimate it inversely according to the literary demerits of their compositions. One, and perhaps the last of the class who have recited their own compositions, and

who must be regarded as in the main a product of the time, and typical of prevailing tastes and feelings, filled a sufficiently distinctive position to warrant a few sentences of notice. John Milne had his home in Glenlivet, in the uplands of Banffshire, and died so recently as 1871. He had been bred a shoemaker, but about 1826 composed a rough rhyme, the theme of which was a tussle between his neighbours (Highland smugglers, with whom his sympathies lay) and the excise officers; and finding that his poetical gift had made him famous, he forsook the awl and lapstone, took to the occupation of ballad-maker, and for a period of over thirty years gained a livelihood and reared a pretty large family in decent comfort by singing or reciting and selling his own rhymes. Mounted on the trusty ass which for twenty years was the companion of his wanderings, he traversed the north and north-eastern counties of Scotland, sedulously attending fairs and markets with his wallet or bundle of "new songs and ballads," and readily commanding the ear and the coppers of the labouring population, whose cause he at all times professed to espouse. It is believed that the number of separate rhymes of his own composition (oft but ringing the changes on an old strain), printed and sold by this itinerant during his long career, amounted to nearly three hundred. Their themes were sometimes political; on rarer occasions religious topics were touched upon, not always reverently. The Scottish Disruption of 1843 was the theme of a derisive rhyme which he sung in the streets of Edinburgh and other Scotch towns, and Sir Robert Peel and corn-law repeal gave him a subject oftener than once; but his prevailing strain was that of exaltation of the rights of the agricultural labourers in the face of their employers, whose inborn spirit of tyranny was assumed, and their characters assailed, frequently with coarsely personal references and indelicate allusions. The circuit through which John Milne itinerated was a very wide one; wherever he went he commanded large audiences of untutored rustics, who hung upon his lips with delight; and as his songs and ballads continued to be bought and treasured by those who looked upon him as the champion of their rights, the influence exercised could not be otherwise than great. Few indeed, in the like humble station of life, have ever exercised an influence so considerable. That it was, to any appreciable extent, an influence for good may very well be doubted.

Of both the chap-book and the country ballad it is not too much to say generally, that while they did little to rebuke vice, and that little too often with a half-leering face, they did a very great deal to foster and perpetuate coarse and licentious habits among the masses—very much more, indeed, than will be believed by those who have not been at some pains to be informed on the subject. Their dominant note, and that which remained most potential in the ears of the people, spoke of ribaldry and gross buffoonery, and not of moral purity or harmless mirth.

Such in scope and character was popular literature, as formerly known to and influential amongst a numerous class. Of other books, that class knew too little to draw from them much of either mental stimulus or moral strengthening in their daily life; and even their scant knowledge of the current events which the newspapers record was got mainly at second hand—by hearsay, rather than from the printed page. Let us ask how far matters are changed for better or worse among the same class.

We shall speak first and briefly of the newspaper press. To a very large extent the provincial weekly press now seeks to adapt itself to the wants and tastes of the labouring population; as indeed it finds its chief circulation amongst them. Penny newspapers of this class, which were altogether unknown less than twenty-five years ago, are now circulated by hundreds of thousands weekly, and find their way regularly into the humblest of homes, as well as into the rough workmen's, and farm labourers' "bothy." It is to the credit of the newspaper press that the literature thus provided is perfectly free from anything like coarseness or indecency. The worst that can be charged against it in one phase is that in some cases journals of this class, in the part devoted to fiction, pander too much to the love of the sensational, and are thus led into presenting to the class that is least able to bear the unhealthy influence of totally false views of human life, and it may be of human duty; no slight evil assuredly, but one which we trust to see diminished by the substitution of what is more natural and wholesome. Fiction has not merely a legitimate place in literature; its function rightly exercised is a noble and elevating one; surely all the more reason therefore that it should not be used toward stimulating a craving after what the hard realities in the life of every man and woman contradict as false in fact and sentiment; or, worse still, in investing the im-

moral in principle with the aspect more or less of the heroic and noble.

We come next to serial literature of an essentially popular kind; such as from its cheapness in price may be expected to find its way to the masses of the population. No doubt the amount of popular literature of an objectionable sort that finds circulation is very considerable; though our information warrants the belief that it is not increasing, but generally decreasing, relatively, if not absolutely; and in some cases, in a very marked degree. And what have we to set against that on the other side? We have spoken of the chap-book seller and ballad-singer as purveyors of a people's literature of some potency. Both are now practically extinct, the former literally so; and in their room we have the colporteur with his pack of select books and periodicals, in the preparation of which the resources of proved literary and artistic skill have been called into use to commend religion and a pure morality to the masses, as well as to gratify the intellect and refine the taste. In 1855, the Religious Tract and Book Society of Scotland, which was founded in 1793, and in the magnitude of its general operations is exceeded only by such institutions as the Religious Tract Society, set on foot its system of colportage. It commenced with a staff of three colporteurs, which in a very few years was increased more than tenfold, and has since steadily grown in numbers. From the Report for 1874 we learn that the staff of colporteurs had increased to no fewer than two hundred and twenty-eight, of whom twenty-nine labour in parts of England, chiefly in the north, the others being scattered over the thirty-three Scottish counties. And in that year, in addition to 55,000 copies of Scriptures, and 120,000 copies of various works of a religious and morally-elevating character, those colporteurs had been the means of selling 840,000 periodicals for adults, and nearly 400,000 periodicals for the young, besides 300,000 cheap hymn-books. The total circulation of periodicals under the Society for the year named was about 150,000 a month, or 1,800,000 a year. Of the total circulation, periodicals at a penny or under amounted to 1,450,000; those at from three halfpence to five pence, numbered 140,000, and those at sixpence (none of higher price being, we believe, sold by the Society) 210,000. The principles of the Society are soundly evangelical; its practice in the selection of the literature to be circulated under its auspices seems to be catholic in the true

sense. Thus in its list of periodicals, supplied through the colporteurs, we find no fewer than thirty-five different periodicals for adults and seventeen for the young, ranging in price from a half-penny to sixpence a number.

In the figures given no account is taken of the religious tracts distributed gratuitously in large numbers by the colporteurs. It does not lie strictly in our way to speak of these, nor of the influence exercised directly by the men themselves as home-mission agents. Yet, in estimating the social and intellectual, as well as the moral and religious value of colportage work, we must needs keep this aspect of it in view. These two hundred and twenty-eight colporteurs who now occupy the place of an undefined number of the old chap-book vendors, and similar itinerants, are men chosen for their known moral and religious character not less than their general intelligence. With the living voice as well as through the printed sheet they act as humble but efficient evangelists. In many cases they are men not only of much earnestness, but also of singular shrewdness of character. And, being fully conversant with the life of those among whom their labours lie, they are able not only to give counsel generally to the erring and ignorant, and to express sympathy with the troubled; but, also, while ready to "render a reason" to those inclined to scoff and jeer, their knowledge of affairs puts them in a position to bring their lessons home with a practical force which the preacher of higher pretensions might often envy. We have found amongst these colporteurs men of various information, who, in addition to remarkable readiness in the use of apt scriptural texts, could appreciate, and in some instances freely quote many of the finest passages in our great English classics. As against the half vagabond "flying stationer" of thirty years ago, with his ragged coat and loose ill-regulated tongue, one can picture with satisfaction the sturdy colporteur going his monthly round; accosting the ploughman a-field, or the blacksmith at his forge, and received by both on the footing of equal companionship as he takes up some general topic of common interest, or prosecutes the business of his own mission; anon giving a Bible or other reading to a group of humble listeners gathered round him of an evening, or praying with the sick and infirm; and again joyously welcomed by the children of the hamlet who have been counting the days till his return that they may get their few carefully-hoarded halfpence expended on the much-prized illustrated magazine or little book. Such a man will

sell on an average from five to six hundred cheap periodicals in a month, or six to seven thousand copies a year; realising, with the addition of sales of books, £80 to £90. The salaries of the colporteurs it may be observed are paid partly from profits on sales, and partly by grants from subscriptions made in each locality where they are at work.

The wholesome results to be anticipated from such an agency as that of the colporteurs constantly itinerating amongst the working population can hardly be over-estimated. Their work lies mainly among those who read little if they read at all, and consequently will interfere but little directly with the business of the regular bookseller. On the other hand, by supplanting literature that is frivolous, or positively pernicious, and fostering and even creating the taste for what is good and wholesome, the bookseller is certain ultimately to benefit through a more widely-diffused taste for reading. We do not need to dwell at length on the high character in both a literary and artistic point of view of the periodical literature supplied. While pure and elevating in tone, it is sufficiently attractive in style to carry its own recommendation with it. "Before it," to use the words of one engaged in the work, "the chap-books, country ballads, and other trash, formerly hawked about in such numbers, have so completely disappeared that a single copy is hardly to be picked up, even by the antiquarian book-collector." And, in their places, the same writer assures us, he finds ready sale (among servant girls quite as freely as among the males) for such periodicals as the *British Workman* and others of the same character. Such testimonies might be multiplied manifold, especially as regards the keen interest manifested by the young of both sexes in the visits of the colporteur, and their participation in the contents of his pack. The facts stated serve to show that, whatever drawbacks may still remain in the shape of frivolous or positively pernicious literature, the course of things in the field we have generally surveyed has distinctly been that of progress in a hopeful direction. In the form of weekly newspapers a secular literature that is at least pure in tone has grown immensely in bulk; and concurrently with that a popular serial literature of a soundly religious and morally-elevating character, sufficiently varied to meet the circumstances of different classes, has been brought into something like universal circulation, superseding and practically exterminating much that was frivolous and bad.

WILLIAM ALEXANDER.

UNDER THE APPLE-TREE.

A DOME of blossom rises overhead,
 Piled like the snows upon some Alpine height,
 And blushing with such tints of pink and red
 As summer clouds may wear in vesper light.

Dew-spangled—pierced with sudden shafts of gold
 That slide between the latticed boughs below ;
 A little world of bloom, that seems to fold
 Birds, bees, and sunbeams in a tender glow.

Life is so sweet beneath this fairy bower
 That the full heart must tremble in its bliss,
 And fear lest wanton breeze or hasty shower
 Should harm one petal by a careless kiss.

* * * * *

Under the apple-tree I stand alone,
In the strange stillness of an autumn day :
Where have the swallows and the brown bees flown?
What cruel hand hath snatched my blooms away?

The sullen, silver-rifted sky looks down
Between grey branches,—not a golden gleam
Falls on the scanty leaves, grown sere and brown ;
And I am haunted by that flowery dream !

O foolish heart !—beside the mossy root
Lie the rich spoils that put thy grief to shame !
He takes the blossom, but He gives the fruit,
That men may magnify His worthy name.

He gives a treasure for a vanished toy,
Filling the soul before its void is known ;
A solid blessing for a fragile joy
His hand bestows :—make thou His gifts thine own.

SARAH DOUDNEY.

SOUTH AFRICA.

BY MAJOR W. F. BUTLER, C.B.

II.

AN evil day was drawing nigh for British interests in South Africa. The Orange River Sovereignty was to be given up. British troops, flag, and government were to withdraw from it, and a boundary was to be set to a dominion, in whose possible future might even then have been read, in legible letters, a realisation of that old name given two hundred years before by the Portuguese discoverer, the "Good Hope" of a great empire set in the lonely ocean beneath the Southern Cross.

It is easy to be wise after the event, to say what should have been, to picture what might have been, to point where empire has been lost, and chance misused ; but in this case of Orange Sovereignty abandonment, such wisdom could have been gathered then quite as easily as it can be gleaned now. Nay, even nature taught the lesson better than she does to-day. At that time, far as the eye could reach, the vast plain of the Free State was a shifting scene of light-limbed antelopes, and millions of wild animals drew rich sustenance from that grass so green in summer, so brown and sere under the winter's sun.

"It is a desert," writes one English governor in 1852 or 1853. "It is richer than any part of Australia," writes another just four years later. Yes, it was a desert in the sense that man was a stranger there, that no fence crossed the land, no homestead was to be seen. It was a desert such as the

rover poet Pringle loved to sing of as he wandered at will through its solitudes. Here is a picture of this desert as he painted it.

"Afar in the desert I love to ride,
With the silent bush-boy alone by my side.
Away, away, from the dwellings of men,
By the wild deers' haunt, and the buffaloes' glen ;
By valleys remote, where the Oribi plays,
Where the gnou, the gazelle, and the hartebeeste graze,
And the gemsbok and cland unheeded recline,
By the skirts of grey forest o'ergrown with wild vine,
And the elephant browses at peace in his wood,
And the river horse gambols unscares by the flood,
And the mighty rhinoceros wallows at will
In the 'vley' where the wild ass is drinking his fill."

True, there was one real desert in it, a region where water was scarce and grass was scant, a spot looking over which the traveller might exclaim, "This is worthless." Yet, even there, in the centre of that waste of red, brick-dust plain, one day a herd-boy caught the gleam of a pebble that sparkled like a star, and to-day on that spot twelve thousand men are digging deep into the earth in the richest diamond mine the world has seen.

There is nothing worthless under the sun ; if the wealth of nature lies not on the surface, it is only because she has hidden it in her bosom.

In 1854 the abandonment of the Orange River Sovereignty was consummated. The story of that abandonment, as it is told to-day in the Orange Free State, is pitiable enough. It is said that the majority of the inhabitants were hostile to the change. Many settlers had established themselves in

the territory, and British power had taken root. The more turbulent Boer had fled into wilds more remote. Settlements were springing up.

All at once the scene was changed. A commission arrived from England to surrender the Sovereignty to the Dutch. For a long time no one would accept the surrender. Meetings opposing it were held; resolutions were adopted, declaring the unalterable attachment of the inhabitants to the English flag; petitions were presented, but they all mattered little; the act had been already decided on, and it was to be done one way or another.

At last a party was got together willing to receive over the territory. They were obscure individuals; but on paper their names, when finally inscribed, looked formidable enough. It is widely asserted to-day in the Free State that this risky feat of penmanship was only achieved by the Boers after a liberal offer of English gold, "to defray the expenses of the transfer," had been made to them by the British authorities.

At length the deed was ratified. The birthright of Britain in this southern world was signed away, and a document was launched into life which, as time goes on, becomes more vividly injurious to English interests, and year by year grows into a more fatal instrument against British power in South Africa, following out but too truly the law which gives to political error no final resting-place. Let us run rapidly over the succeeding twenty years.

The Free State grew. Another large Republic arose still farther off to the north. Where the Free State ended at the south shore of the Vaal River, the Trans-vaal Dutch Republic began on the north shore, and ended no man could tell where. One ambitious President fixed the northern boundary at the Crocodile River, another said it must be at the Limpopo, another would claim the Zambesi, the tropic of Capricorn, or the Equator. If the natives objected, a "Commando" soon settled matters. A Commando was merely a new name for an old thing. It was war without any of the usages or restraints which civilisation has imposed on war. It meant night surprise, destruction of crops and cattle, no prisoners, cave-smoking, killing of women, &c.

Here is Lord Stanley's opinion of Commandoes:—"They are frequently under-

taken," he writes, "as a means of gratifying the cupidity or vengeance of the Dutch or English farmers; and further, they are marked by the most atrocious disregard of human life."

But farther off, towards the remote north, they meant more than this. There was in the Trans-vaal an institution called "apprenticeship." Young negro children, without parents, could be apprenticed to farmers for a term of years. Orphans are not more numerous in the neighbourhood of the Limpopo than they are in other parts of the world; but when orphans are at a premium it becomes possible to improve upon nature, and to make them to order. It rests upon authority not to be disputed that women were butchered at their kraals in the north of the Trans-vaal Republic but a few years ago, for the sole purpose of enabling their murderers to carry away orphans to Prætoría, the capital of the republic.

All this is very horrible, and many men reading it in South Africa will perhaps exclaim against the writer for here placing it on record; but it is better that these dark things should be brought face to face with the light of day—better for us in England, as well as for our cousins in South Africa; for, strong as we imagine to be our sense of justice, of honour, or of courage, it is well for us to know that it all rests upon a frail foundation, and for those in savage lands to realise that, no matter how remote may be the region wherein these dark deeds are done, there will come a time when, even to the short-seeing eye of man, they will be laid bare.

But to return to the Orange Free State and our mountain Basutoland.

Some years after the withdrawal of British power from the north of the Orange River, war broke out between the Boers and the Basutos. The conflict ended favourably for the natives. The Dutch farmers could with difficulty be held together, as yet the infant republic lacked the spirit of nationality or of cohesion, and Moshesh proved fully a match for his white enemies.

Peace was made, leaving matters much as they had been before the struggle.

In 1866, war broke out afresh. A new President had assumed the direction of the Free State Government. He was a man trained under the influence of British institutions, although a thorough representative of Dutch traditions. His energy and determination soon made themselves apparent. The Basuto war was carried on with vigour.

Hitherto the table-topped fastnesses south of the Caledon had been deemed impregnable. In 1867, Makwai's mountain was attacked and taken, and soon after Tandtgiesberg was carried and the chief Pushili killed.

The following year saw the Boers in possession of Qumi, the mountain stronghold of Letsia, Moshesh's favourite son; and the same year beheld the celebrated Thaba Bossiou, Moshesh's mountain, invested by his enemy. The fight around this rugged hill was long and varied. Several times the Dutch attempted to storm the steep stronghold, and as often were they forced to relinquish the assault. Englishmen mustered strong in the Dutch army, and English breech-loading rifles, and Armstrong and Whitworth guns, were plentiful too.

The Free State complained bitterly that we aided the Basutos with arms, and ammunition, and sympathy; but every rifle fired at Thaba Bossiou, and every shell flung on the rocky ledge where old Moshesh battled bravely against his foes, came from an English arsenal or an English factory; and when, once, a Boer column did make a temporary landing on the scarped ledge by the summit of the beleaguered rock, it was an English officer who led them on, fighting for hours alone upon the ledge from which his followers had retreated. If our sympathy went with the Basutos, something more practical than sympathy was given to the Dutch.

Thaba Bossiou was never taken. Reduced to direst famine, shelled and shot at, the rocky ledge still held out; and before famine could complete its work, British intervention saved the mountain State; Basutoland was declared British territory, Moshesh was taken under the protection of the English flag, and the Free State was told to stay its hands. It was full time for our intervention. More than two thousand Basutos had fallen; all the cattle, horses, waggons, ploughs—even clothes belonging to the natives, had been destroyed; the kraals had been utterly demolished; the wretched women and children and old men had crowded into dark and loathsome caverns in the rocky hills, where, bereft of food and covering, they perished miserably from fever, cold, and famine.

Of course there were loud denunciations from the Dutch for this saving from utter annihilation of the remnant of their foes. They had already annexed the greater portion of the fertile valleys north of the Caledon; they hungered still for the rugged hills and steep glens which lay between the Caledon and the blue Maluti mountains; and to-day, through

the Free State, one often hears, heading the catalogue of crimes recounted against England in South Africa, her merciful preservation of old Moshesh and his mountaineers from the rapacious destruction of the Dutch Boers.

In the foregoing pages we have sketched the history of this native mountain State, not because of any importance to-day attaching to its existence, or of any influence which it exercises upon the communities surrounding it, but because it is, geographically speaking, the keystone of the South African structure, the fountain-head of its water-system, the summit of its surface; and as from the Alps one looks down upon France, Italy, and Germany, and by a single turn of the head takes mental grasp of half Europe, so this rugged land of peaks has beneath and around it a sweep of horizon which embodies almost at a glance the entire topography of South Africa.

To catch from mere description the outline of a continent, to see mountains and rivers, plains and valleys, as they lie in the vast inanity of nature,—to behold that wonderful view over the outspread earth which the eagle sees when he is a speck in heaven, that "bird's eye view" which we so often speak of, but so seldom realise—this, perhaps, is the most difficult task the reader has to learn from the writer; for it is a lesson hard enough for the man who has himself looked upon the land which he would fain portray; and it is also a lesson without knowledge of which all other knowledge of the people or policy of distant lands is unfinished and incomplete.

In the preceding pages we have looked, as it were from a lofty height, upon that part of South Africa which contains to a greater extent than any other portion what may be called the future of the continent.

Coal, iron, gold, diamonds—these are great treasures; and these lie locked beneath the lands we have just surveyed, to an extent the knowledge of which is still in its crude commencement.

There is an angle of the meadow which we call Natal, where four States all meet together at one point. Through a vast rolling plain, many streams and rivers run eastward from the Drakensberg; a few ostriches still stretch their long necks above the hill horizon to watch the passing traveller on his way; the oribi bounds from the yellow grass before the horse's gallop; a herd of hartebeeste watch warily from afar at waggon or rider. The place is called the Newcastle Flat. It is

well named, for frequently one sees, when the yellow clay has been washed and cut into deep channels by summer floods, huge dark seams of rock-like coal thrust up between layers of trap and sandstone lying but a few feet from the surface. It is a curious sight. Here, unworked, unheeded, unborn, lies a mighty future; this is the great coal-bed of South Africa. As the rider now draws bridle by one of these breaks in the yellow clay, he sees only the great stretch of plain, the wild deer on the hill-top, the sun going down blood-red through the smoke of distant grass fires; he hears nothing but the rustle of wind through waving grass, and the drip of water down the sandstone channel; and, as he looks upon the quiet wilderness, there crosses his mind a vision of great factories; of tall chimneys, pouring forth dark streams of smoke, blurring the sunlight and blotting the sky; of men and women and children, from whose faces the light of heaven has also been blotted out and blurred; of the flare of gas on pallid cheek, and the roll of steam along iron road, when, in the fulness of time, this dark deep seam shall be followed into the bowels of the earth, and flung forth to feed the furnaces of the world's toil.

We have already spoken of the diamonds of the Vaal River. We will now endeavour to place before the reader an image of the gigantic pit in whose depths ten thousand men are delving deeper year by year.

We have said before that the Vaal and Orange Rivers, both springing from the range of the Drakensberg, approach each other some three hundred miles from their sources, and joining their waters in the midst of a vast plain of brick-coloured clay, on which the thorny mimosa grows, gnarled and stunted, in scattered clumps, pours westward a constantly-decreasing volume through the sands of Damara and the arid plains of the Kaliharri desert.

In the angle formed by the two rivers, at about eighty miles from their point of junction, a strange scene rises suddenly before the traveller's eye.

In the middle of a great plain—a plain so vast that its hills and undulations, its trap eruptions, "kopjes" and salt pans, are all merged by distance into a uniform sense of level—there is seen an immense assemblage of huts and houses, tents and flagstaves. High above roof or flag-pole a huge, irregular mound of earth rises from the centre of this city on the plain, and as the traveller approaches the city he sees that it is built around the base of this great mound, which

shelves down at that steep angle which is formed by the labour of the navvy-mound builder working from a higher level.

Without design or order, the huts and tents rise confusedly on every side; corrugated iron and canvas are the materials from which dwelling-house, church, drinking-saloon, store, and shed have been built. The city of Kimberly, or Colesberg, or New Rush, as it is variously named, is a city of tin and tent. But if the materials with which man has built this town in the desert be simple, the builder-man has been compound enough. Europe, Asia, Africa, America, and Australasia have all sent their representatives to Kimberly. The African delves in the mine; the representatives from the rest of the world buy, sell, and drink in the town. When the water deepens in the great pit, the two first avocations are considerably curtailed, and in their places are substituted politics. Two great factions then appear in the city of diamonds; they are "loyal men" and "rebels."

On the latter side one finds the usual curious combination; there is the German malcontent, there is the English malcontent, there is the Irish malcontent, and, in addition to these units of European disaffection, there is also found here the malcontent of Natal.

First take the Teutonic upholder of liberty. He has two prefixes to his name—Captain and Von. It is needless to say that he possesses only that claim to either title that arises from almost unlimited capability of consuming beer and tobacco. He has a popular reputation, however, for having seen service, and there are certain hints thrown out by his immediate friends of his being closely connected with Von Moltke, whose portrait (taken from an illustrated paper) is hung conspicuously in his tin house.

Captain Von Drinckhishfils commands a following of about forty men; they are all Germans, and have, like their leader, acquired, rightly or wrongly, a reputation for arms; some are Bavarians, some are Saxons, some are pure Prussians; all are imbued with a high spirit of independence, discordant wind instruments, strong waters, and tobacco. They do not wash much, and whether in the mine or in the glass, hold water in low estimation.

Von Drinckhishfils and his company are reported to have shown considerable military knowledge at a recent rescue of a "rebel" storekeeper from the hands of four constables who were conveying him to jail; on which occasion they took up a strategic position in

an extinct diamond pit, a position which was as menacing to the four representatives of tyrannical oppression as it was secure from any stray bullet which might happen to be abroad.

The English malcontent is quite another kind of being; his antagonism to the government at the Fields is based chiefly on opposition to the principle of universal equality of black and white men. He is of that type peculiar to the middle and lower class Anglo-Saxon, whose ideas of universal equality have reference only to a set of beings *above* them in the social scale, and who would substitute repressive superiority whenever the sentiment affects a lower or a differently-coloured race of men.

He takes his stand, he will tell you, upon the inalienable right of every born Briton to make, frame, and adjust his own law, and as he individually has not made, framed or adjusted the law by which native Africans are graciously permitted to dig on African soil for African diamonds on their own account, he is determined to resist to the utmost such a manifest injustice.

But what are our Teuton or English malcontents compared to their Irish brother? Simply nothing. He has seen service; his career is deserving of notice. When the great State of New York resolved to die for the principle of American union, the subject of our memoir entered the American service. The great State of New York, and sundry other States of the Union, had found that dying for one's country, sacrificing life at the shrine of duty, &c., could be done on a principle quite different from old-world ideas—could be done, in fact, by contract.

If A wanted to die for his country, why not get B to take his place? The first principle of American liberty, in thought, word, and action, is, that one man is as good as another; therefore, if B is as good a man as A, it follows that A can pay B to perform the usual ceremonies of enlistment, attestation, drilling, &c., necessary in modern society, ere the time has come for the supreme act of devotion.

There is a curiously-shaped portion of Western Canada which projects into the great lake system of North America, almost touching the State of New York upon the east, and the State of Michigan on the west. Upon this projecting peninsula the subject of our memoir took up his temporary residence. One day he crossed the Niagara River to the city of Buffalo, in the State of New York. So many persons in that State had suddenly

come to similar conclusions upon the question of dying for their country, that substitutes had reached a high figure; they were worth two thousand dollars each. The subject of our memoir was duly enlisted in the American service; but on the night following his enlistment he contrived to get away from his lodgement, and recrossed the river to Canada two thousand dollars richer than he went. A few hours' railway travel brought him to the other extremity of Canada, and he passed over to the State of Michigan. Substitutes were not quite in as much demand at Detroit in Michigan as they had been in New York; nevertheless, the subject of our memoir, being of large frame and manly form, was eagerly accepted at fifteen hundred dollars, and during the ensuing night he again safely regained his adopted country without let or hindrance.

He was now a well-to-do man; but, unfortunately, the longing for additional sacrifice of life in defence of the principle of union was too strong for prudence, and he again ventured to offer himself as a substitute at Buffalo. This time good care was taken that he should proceed towards the theatre of war, and accordingly we find him drawing near the army of the Potomac.

It was about the period when General Sherman had conceived the brilliant idea of moving his army of the Tennessee to Savannah. That move, for ever embalmed in history, is to-day told in song and story throughout the wide width of America, and above every other tale of the war of Secession, ranks that which tells of the events "when Sherman marched down to the sea."

Well, extremes meet. The subject of our memoir also performed a similar feat. Quitting the base of operations of the Army of the Potomac, and marching quickly "down to the sea," he took shipping for his native island, where, in due course of time, he arrived, having acquired by more or less questionable means the rank of self-made colonel, with some three thousand dollars in hard cash.

Everything is different in America from its counterpart in Europe. Even the "purchase system" in the army was conducted on other principles. Our Irish malcontent arrived in Ireland about the beginning of the Fenian agitation. He espoused the cause of the tenant farmer with the same eagerness he had already shown in supporting the claims of the North American Federalist; but Ireland was not a country as well calculated to display his peculiar talents to advantage, and

he was soon in the hands of the police. Of such fish the Government net was already full enough, and, after a few weeks' incarceration, he was liberated on condition of his seeking other lands. The diamond fields had begun to attract popular notice, and to South Africa our liberated Fenian shaped his course, to fill in time the vacant post of Irish mal-content in the city of New Bush.

At some length we have drawn the characters of these representatives of freedom in this free and easy community of Kimberly. The picture is not over-coloured, nor is the space which we have given to it too large for the canvas at our disposal.

It is not yet a year since a regiment of soldiers had to march fourteen hundred miles to quell an attempt made by half-a-dozen such men as we have just described, to overturn the constituted authority of Government at the fields; and those who are best acquainted with the individuals who represented advanced opinion on that occasion will not fail to recognise in the foregoing photographs correct likenesses of the heroes and leaders of a revolt which cost South Africa some £60,000.

And now, having glanced at some of the human dwellers at the base of the great mound of Colesberg, let us ascend the steep bank itself, and gaze at the curious scene which opens before us.

A big pit, at top twelve acres of superficial size, two hundred feet deep at its deepest, its floor cut into innumerable squares, its sides falling steep from a clear cut edge. Around that edge rise, tier over tier, three rows of wooden platforms, from which wheels and pulleys, and iron ropes run downwards into the yawning pit below. Thick as black men can swarm, on these wooden platforms stand nearly naked negroes, working wheel and pulley, bucket and rope. Looking down into the pit, one sees thousands of wire ropes crossing and recrossing each other, stretched "taut" from "the claim" beneath to the platform above. There are six hundred whole claims in this mighty pit; but claims have been split into halves, quarters, eighths, and even sixteenths.

Down below black figures, dwarfed by distance, are digging, picking, and filling into leather buckets a dark bluish clay, half stone, half marl; when the bucket fills, a signal to the men on the platform above is given from beneath, the wheels fly round, and along the wire rope runs the load of "diamondiferous" clay to the pit edge aloft.

Beyond all attempt at number are these ropes and lines of wire; buckets come and go along them with puzzling rapidity. A mighty whirr of wheels fills the immense arena; a vast human hum floats up from ten thousand throats. Such a sight must the great tower by the Babylonian stream have presented; but assuredly nowhere else could the eye have taken at a single glance such a vast accumulation of labour, all tending to one toil and one effort—the digging of a vast pit into the earth.

Let the man be who he may; let him have seen all the world holds that is worth seeing in the work of man, old or new; let him have grown tired of wonders by land and sea; still we will venture to assert that, as he climbs the side of this clay mound, and looks from the edge of the bordering rock into the Colesberg "Kopje," he will stand for a moment riveted to the spot, in the first impulse of a new astonishment.

But there are many questions which the reader will require answered, ere he can see even faintly the pit and its mode of work. How is the dividing line kept between claim and claim? Where is the clay put that is taken out of the pit? How are the diamonds extracted from the clay? Is the clay all of this bluish marl-like description? How are the sides of the pit kept from falling in? These, and many more questions, will arise to the reader's mind as he scans what we have written.

The pit sides are cut steeply down. Nature has faced them for the most part with a lining of rock. This lining, called "the reef," forms the boundary of the diamond mine: one foot outside that boundary reef there are no diamonds. At times the reef hangs dangerously over the pit, and then it has to be taken down, and the edge sloped off at a greater angle.

For a great depth, now, the work has been carried through nothing but this blue marl-like clay, but it was not always so. At first, the soil was a reddish gravel; it was rich in diamonds. All at once the red gravel gave place to yellow clay. Men said, "There will be no more precious stones, the red gravel is all gone;" but men, as they often are, were wrong, and the diamonds went on as before. At last the bluish soft rock was reached; again the wise people said, "Now there is an end to diamond digging." But diamond digging went on in the bluish marl rock, as it had gone on in the other clays and gravels.

When this clay, or rock, or gravel is brought to the surface, it can no longer be

piled, as of yore, around the edge of the great pit; there is no room now, and already the heap is high and vast enough. So hundreds of horses are employed in carting away the diamondiferous soil, and placing it in various parts of the great surrounding plain. Here the action of sun, and air, and cold night soon causes the half-solid mass to disintegrate, and then, when it has softened, begins the work of washing.

To pick out the precious stones was for years no easy matter; the apparatus was rude and incomplete, and many a valuable gem slipped through and was lost in the *débris* clay. Now all that is changed, a closer scrutiny is possible; and so perfect has become the means of sifting, that the old *débris* of former years is being worked over again, and many a rich gem taken from its vast accumulation.

People will naturally ask, "Must there not be great robberies practised in this immense pit?" The answer is, unquestionably, Yes; but let us not run away with the matter all at once. These frequent pilferings of stones are the chief causes of the white man's antipathy to his black labourer at the fields; but whenever we have heard the negro denounced for his diamond-stealing, it has always occurred to us to ask our righteous white friend, "How do you think you would fare if you employed twenty white men instead of these twenty Zulus or Bechuanas? Do you think the pilfering would cease? Not a bit of it; it would be ten times greater." We unhesitatingly state our opinion that if the present system of diamond-digging were attempted with the ordinary white labour of the world, be that labour British, German, or American, it would be simply impossible to continue it, so wholesale would be the stealing. It is only with the black man that there is left sufficient honesty to permit the continuance of profitable digging.

The term "digger," as it is frequently used at Kimberly, is a delusive one. In the papers, over the doors of shops, in political placards, one sees the "digger" prominently put forward. There are "digger associations," "digger saloons," "digger meetings," even "digger drinks," but the real digger is the negro. The proprietor of the claim is no more a digger, in the American or Australian sense of the term, than an English railroad contractor is a navvy.

Some years ago, when the diamond excitement was at its highest point, an English illustrated journal published a view of the

fields. In the background of this picture many negroes were at work, picking and grubbing in the earth; in the foreground there stood the figure of a white man with an umbrella over his head; he was busily engaged in kicking a large negro; both parties seemed dissatisfied with the occupation. Matters have changed since then. The competition for negro work is now very great, and masters have to be more careful how they kick.

"Give a dog a bad name and hang him," says the proverb. Give a master a bad name, and his work hangs, is a patent truth in South Africa.

It is curious to note what a strange variety of opinions one hears throughout the country relative to black labour. "He [the negro] is the laziest brute on earth," one man will tell you. "I can get as much labour as I want," will confide to you the next comer.

To-day, in the Free State, it is almost impossible to obtain labour on a Dutch farm. Go a few miles off, to an English holding, and you will find labour sufficient and to spare.

We do not mean to assert that the negro works for the sake of work. Who does, the wide world over? But we do say that in Natal, in the Orange Free State, and at the Diamond Fields, labour can be obtained by those who go about it in the right spirit.

In South Africa, no white man works. There are white artisans and skilled workmen, it is true, but they are at enormous wage. They make more in a week than many London office men make in a month. At the Diamond Fields they obtain £2 per diem, and in Natal £1 or more; but the white labourer, pure and simple—the man with the shovel, the stone-breaker, Hodge in a smock and with a hedge-clipper—does not exist. There is no hiding the fact that labour is at a discount; some will tell you it is because of the climate, but in America we have seen white labour carried on unceasingly, under conditions of heat and exposure more trying than this of South Africa. The real cause is to be found in the fact that black labour is possible to obtain.

What the black man does in this matter, his white cousin must not do. "The nobility of labour" ceases to bear patent when the African has to be raised to the peerage through it, and the "long pedigree of toil" becomes considerably shortened when its tree has its root in the "midriff" of the negro.

WHAT SHE CAME THROUGH.

BY THE AUTHOR OF "LADY BELL," ETC.

CHAPTER V.—"MADAM."

face, with the great purple circles beneath the heavy eyes.

"I daresay I have," answered Anne evasively; "one is so apt to think that one has not closed an eye; but it does not signify, we have a great deal to do to-day."

All Anne's late passiveness was gone and was succeeded by a feverish energy, but she spoke in a hoarse voice, and coughed an oppressed cough at the end of the sentence.

Pleasance was only too thankful to have Anne in her natural place, taking the rule, and was more than willing to subside into her rôle of the thoughtless, irresponsible, yet not indocile junior. But she recognised with dismay the tokens of illness in Anne. Pleasance's perceptions being sharpened by the recent shock to her nerves, she recollected in time how severe and trying Anne's colds were wont to be, and exclaimed, "You have caught cold, Anne!" and urged the precaution of her sister's remaining in bed and suffering Pleasance and Mrs. Balls to nurse her.

Anne, however, scouted this idea, and even smiled languidly at the notion of Pleasance as a nurse, while she said Mrs. Balls would drench her with possets and hot drinks, as if she were a favourite cow;

XVII—8

whereas she meant to get up and shake off the slight cold, and be very busy to boot.

"It will never do now for me to give way," said Anne with shining eyes, "in my position now, it would be inexcusable, and the back is made for the burden."

"Very well, Anne," said Pleasance, quite ready to be persuaded that no care or anxiety was necessary, and very eager to hear what Anne proposed to do, while they dressed themselves, Anne discharging her usual office of dressing Pleasance's unruly hair. Pleasance made up to herself for the penance which her hair-arranging had always been to her, by peeping over one of Mrs. Balls's half-blinds, and watching for the appearance of horse, or cow, or pig, or feathered fowl in the stack-yard.

"Pleasance," said Anne, in an altered voice, which betrayed intense emotion, "I am determined to write to that woman and renounce all connection with her."

Pleasance did not require to ask what woman Anne meant, but she was impressed by the concentrated bitterness with which her sister spoke. As for Pleasance, though her girlish instincts had also been outraged, in a sense, by Mrs. Wyndham, yet if she had been left to herself, she would have thought and spoken no more of the stranger aunt.

Notwithstanding, when the idea was suggested to Pleasance, she was perfectly prepared to follow Anne's guidance, and to defy her aunt in the most recklessly imprudent fashion.

"What shall you say, Anne?" asked Pleasance, entering into the spirit of the thing.

"I hope I shall not be unnecessarily disrespectful," said Anne, in a quivering voice, and shaking in every limb as she spoke, "since she is papa's sister; but I am sure that papa never meant that she should come and wantonly insult us—his very silence about us to her implied as much—I think I shall be only remembering what is due to him, and doing as he would have had me to do, by telling her that we do not wish her to trouble herself any farther about us, and that we refuse to let her dictate to us with regard to the future."

In spite of Anne's precocious womanly intensity of feeling, it was a new experience

to have her thus agitated and impetuous, while Pleasance stood by quiet and only moved in answer to Anne's emotion.

"Yes, of course, Anne, she knows nothing about us—she seemed to reckon us nuisances—she might propose to separate us next;" and under the force of that supposition Pleasance grew eager in her turn. "When will you write, Anne?"

"Immediately after breakfast, if Mrs. Balls has paper and pens and ink," returned Anne.

"And I can carry the letter to the village post-office, where Mrs. Balls sends her letters," said Pleasance.

"We must go to the village first," said Anne, sobering down and speaking almost solemnly; "we must ask Mrs. Balls to take us."

"Oh, but Anne, Mrs. Balls is always busy of a morning, even when she says the milk has not come on," exclaimed Pleasance puzzled at the necessity.

"Still, she will go when I ask her," said Anne in a convinced tone. "Haven't you thought that we must get things?" and Anne, with a little air of reproach, glanced down at her grey camlet gown. "I have half-a-sovereign and I think that you have half-a-crown still of our pocket money; and I have been counting that may buy two black calicot gowns and black ribands for our straw hats like—like those Elizabeth and Susan had at Miss Cayley's when her sister died."

"But Anne," confessed Pleasance with compunction, "you forget the card-board I bought the last time that we were at Heavittree, and Miss Eckhard took the rest of the half-crown to keep for fines, as she said I was sure to throw away my money, and have nothing to pay when I had one of my impositions; and if I escaped, then the money would be there for me the next time we went into Heavittree."

"It can't be helped now, we must make the half-sovereign do, as poor people manage, perhaps Mrs. Balls will tell us how; and we must contrive to make the gowns and trim the hats for ourselves; I think I could do that. I need not say anything about your being more careful in the future, poor child, because we have to see in the first place about your having something to be careful with—at least, there will be no more fines, Pleasance."

Strengthened by that small consolation, Pleasance accompanied her sister to the great Manor kitchen, which Mrs. Balls had been employed in "cleaning up" and set-

ting in order hours before, working softly with a care of disturbing her poor young, gently-bred cousins, for whom she had not failed to air the best room. This was a small and stuffy wooden-paneled parlour, with faded woollen curtains and old tapestry-worked chairs, which had fallen down out of "gentlefolk's housen," that had been coeval with the better days of the Manor. Altogether it was much less pleasant, although it might be grander in Mrs. Balls's eyes than the kitchen. But she would not fail in any respect which she had ever paid to the "poor gals;" and she would let them have a room to retire to for their own chat, to be out of the way of her gossips, Mrs. Morse of the Brown Cow, and Mrs. Blennerhasset next door to it, even though Mrs. Balls had the sagacity to predict that the girls' stay would be longer than they anticipated; "but I ain't the wumman to turn the poor mawthers out, like them cowl-hearted gentry their father's kin. They 'a a sum of money to fall back on, and if they hadn't I 'ould work my fingers to the bone to give a help to my own cousin Pleasance Fowler's children; and neither was Pleasance come on such low people for all she married to. The Fowlers were respectable yeomen these hundred years gone, bettern trash on gentry."

When Mrs. Balls had tempted Anne and Pleasance, to the best of her power, to make a good breakfast from her new bread and home-made butter, cups of coffee and bowls of cream, with a souce cheese, sausage-rolls, and cold apple turnover as *pièces d' resistance*, she heard, and quickly consented to their request that she should go with them on their errand to the village.

"They'll be mis'able if they don't get to buy murnins," she said to herself, as she put on her substantial shawl and bonnet, "though I dunno that they have so much to murn for except loss of hope, and that's often the wust loss on all sure-ly, for all that fatter of theirn a done for them, to go a-trapesing and a-guzzling in furrin parts a-spending on his last penno, when he might a been laying his shoulder to the wheel and working like a man for his gals. I'd offer to lend them a guinea, though I never saw its yellor face again. I can stand trate fudder than that; thank the Lor' I've not been head dairy-maid and housekeeper at the Manor for nineteen years come Whissunday for nor'n; but it would go hard with the elder gal, Miss Hatton, her that so favours poor Pleasance her mother, to take a penno of

"WHAT SHE CAME THROUGH."

mine, though her mother and me shared and shared alike, many's the day; and yet cousin Pleasance could not stomach a-forcing herself in among her husband's high relations. Wool, pride gets a fall, passon tells me, but pride d' differ, and I like my folk's pride, I do, root and branch."

Mrs. Balls, in her good-will, did not fail to remark that Anne had suffered from her journey of the day before, and made a suggestion that it might be the better for her to keep the house till she got her voice again, and was not croaking "like a frog at a rail." But when Anne assured her that there was very little the matter with her, and that she was quite fit to go to the village, Mrs. Balls did not take it upon her to contradict the young lady, and did not apprehend any risk from the excursion, seeing that all her experience was among brisk country girls who could not keep themselves up, and who took no harm from liberties used with the weather or their own constitutions.

The day was not a repetition of the last fine April day; it was one of those misty sunless days, when in a watery country like that in which the Manor was situated, all looks wan and sodden.

The road was far beyond the girls' thickest soled boots, and took Mrs. Balls herself in her stout laced boots, as she expressed it, "up t' fetlock."

The fields had a thin white shroud over their pasture and over the broad ditches which instead of hedges formed the boundaries. Out of the shroud, horses and cattle, already put out to graze, loomed in elephantine proportions, while the nearest windmill and brown barge which came sailing out of the mist along one of the invisible slow rivers, appeared still more gaunt and spectral.

It was a colourless, cheerless day, unnatural to weirdness. Mrs. Balls said, "It rizes my corruption, for nor'n is like itself, and I feel the damps going into my blood like the smut into the corn."

The village of Saxford stood at the top of a steep ascent, where there was so much level land, and showed from below like a miniature city set on a hill. Close at hand it was an irregular assemblage of houses, mostly white-washed and thatch-roofed, some of them tumble-down with age, none of them of higher pretension than another, except the little church built of grey flints standing somewhat apart at the end of a broad walk between hedges, and the village inn, bearing the sign of the Brown Cow, but even the

inn and the church had thatched roofs. There was a primitive rudeness about the whole place and its inhabitants, from the sharp turnings and narrow windings, the steep ruts and the pools of water of the single street, to the loud rough voices of the stolid and careless, well-nigh aggressive, people, mostly women. They stood about their doors, and did not refrain from jostling Mrs. Balls while they hailed her with "A fine day, Missus Balls, now how be you?" and jostled still worse, in order to look right into their faces, the two "main genteel gals," drawing nearer her for protection.

Mrs. Balls did not fail to afford it, and to speak her mind plainly. "I be rarely well, Sairey Larkins," she duly replied to one of the questions after her health. "But there be summat wrong with your manners. Don't you see I'm with your betters? You make room for them." Sairey, a slovenly-dressed, blowsy-looking young married woman, wearing an outrageous crinoline beneath her torn gown, and having her hair roughly dragged over a huge chignon, under a ragged greasy net, gaped and then laughed, not ill-naturedly, as at a good joke.

"Her mightn't a been so easy to deal with, had I not been here," muttered Mrs. Balls. "Them gals is hardest on gals of another feather, like fowls in the barn-yard when they fly at a speckled bird, and which we've Scripture for. My young ladies mus'n go to the village by themselves, not yet awhile; why even Miss Pleasance d' look like a hunted hare."

The shop to which Mrs. Balls took the girls was the only shop in the village, and was a general store. Coarse groceries mingled with earthenware at one side of the window, and coarser haberdashery at the other. Within, in the middle of confusion and sluttishness, the greatest ease, deliberation, and sociality prevailed, between the shopkeepers—two women—and the customers.

Mrs. Balls found it desirable to introduce her two companions to the owners of the shop.

"I 'a brought two young ladies; Miss Hattons, daughters of my cousin Pleasance, as made the great marriage, you remember, Missus Grayling? And this be Missus Grayling and her widder sister, Missus Bradbeer—. The young ladies 'a met with a loss, sudden; their father in furrin parts, and they want murnins, jest a put-by for the time they are here," Mrs. Balls added.

This was the compromise on which she

had settled in the walk, between the rank which she was insisting upon for her visitors, and what was a poor order even for the "willage." When agricultural wages were at their best (and that best was considerably heightened in this quarter, by the neighbourhood of the sea-port of Cheam, with its demand for able-bodied men to go out as seamen and fishermen, and women to act as lodging-house keepers, or shop-girls, or to take service), the natives were as unrestrained in their indulgence in gaudy, even expensive clothes, as they were given on the same occasion to gross abuse of food and drink.

"You be come for a change, I lay it," remarked Mrs. Grayling, a long, lanky, sallow woman, in a cotton velvet jacket, over her skirt, and a dishevelled bunch of flowers as the most prominent covering to her moulted head. "Now what be the complaint your father died on? for I hear say there be a power of complaints about."

"Sudden, didn't I say, Mrs. Grayling?" interposed Mrs. Balls, quickly and with emphasis, "and the young ladies on'y heard on't yesterday, and I dessay you've heard tell the feelings of gentlefolks ain't like ourn, they be kinder tender, and not fit to be trampled on."

"Whose a-trampling on feelings?" demanded Mrs. Grayling, with sharp protest; "and if gentlefolks, set en up! wunno speak o' their dead, the more shame to en, ses I, were they queens on their thrones."

"Wool you show Miss Hattons some on your clearest black calicots," said Mrs. Balls, taking no notice of the reflection, "as a go-by, and sin' the weather is setting up."

"Much the weather is setting up this mucky day," said Mrs. Grayling, contemptuously, "it's more like that the genteeler your frien's be the fewer pennos they 'a to spare, for I 'a noticed that pride and poverty do go together like mites and cheese, and since you and your frien's on'y come here for a go-by, Missus Balls, you may go by my shop altogether, and little loss." However, the perpetration of the small witticism relieved Mrs. Grayling's mind of the consequences of the provocation which it had received, raising her spirits and restoring her temper to its normal state of crusty solemn facetiousness. "As we 'ont be unneighbour like," she enjoined her sister, who was a humble fac-simile of herself, in a knitted jacket over her skirt, and some rusty black ribands in tokens of her widowhood, the salient point of her head-dress, "to bring out the

black calicots, them with the little white spots like tears, or beads, or goodies, as you take them—it's like that the gentlefolks will prefer to think o' the goodies sin' they're so delicate they might be washed away with the mere mention on tears—and spread them out afore Missus Balls and her fine gals."

Anne and Pleasance were partly confounded and partly uncomprehending, and they continued so after the choice of the calicots, and ribands, and black-edged paper, for which Anne was as solicitous as for anything else, since she would not have felt it proper to write her projected letter on any other.

Mrs. Balls took it upon her to do the chaffering at the conclusion of the purchase, and she and the mistress of the shop gave and took in the most composed manner, as if it were a thing of course, and without any hostile intention on either side, the most unvarnished accusations of cozening statements with regard to the quality and quantity of the goods on the one hand, and of meanness and suspicion in questioning the account on the other. At last the bargain was ended, without a pitched battle, or enmity for life having been established between Mrs. Grayling and Mrs. Balls; on the contrary, with every evidence of the mutual respect and cordiality existing between the women, having been only confirmed by their encounter.

Mrs. Grayling would have "Missus Balls and the gals" keep out the cowl by taking a sup of cherry brandy or ginger cordial. She sent Mrs. Bradbeer in a perfectly obliging manner for the glass of water which Pleasance ventured to ask, and while she was drinking it, Mrs. Grayling regaled Mrs. Balls with the latest and choicest scandal of the village.

But when Mrs. Balls and the girls left the shop, they were beset by another annoyance. Loud titters and giggles came from the shock heads of several half-grown girls, which were first projected and then withdrawn from behind a blacksmith's shed next the Brown Cow.

"It's them young Blennerhassets," said Mrs. Balls. "I'd wallop them an I could get at them;" but she did not speak otherwise than serenely.

It was such a strange region to Anne that it combined with her other load to crush her from the first.

Arrived at the Manor, Mrs. Balls declared a little mournfully, though she did not intend a reproach, that she had lost a day, and pronounced herself more knocked

up by a walk before noon than if she had churned a "stun" of butter, or pressed the whey from the curd for half-a-dozen cheeses. As for the girls, they withdrew to the company, room to write their letter.

Though the letter was composed at Anne's instigation, and was to be in her handwriting, a copy was scribbled by Pleasance, not only because Anne's head ached, but because Pleasance was the inventive genius of the two sisters. Writing—in a queer, little, cramped, yet not illegible handwriting, as different as possible from Anne's carefully formed, symmetrical letters—came as naturally to Pleasance as water comes to a duck. It need hardly be said that composition, of which writing is an expression, was a native element.

But Pleasance paused on this occasion, and in place of scrambling over her ground with all her fancy prompted her, sat and looked gravely at the black edges of her paper and waited for instructions from Anne.

"Dear Aunt," she did write of herself, and read aloud.

"Not 'dear aunt,' Pleasance," forbade Anne in strong opposition. "How could you think of writing 'dear' to such a woman, who blamed papa, and told us she meant to have nothing to do with us, letting us see she was ashamed of us?"

"But 'Aunt' looks so odd," said Pleasance, with a constraining sense of literary propriety, as Anne was constrained by propriety in other quarters, "and I must have a beginning; I must begin, too, with a personal address."

"Write 'Madam.'"

"But that is formal and formidable." Pleasance was still doubtful of the term, though she wrote it at Anne's bidding.

"I mean to be formal and formidable," said Anne; "at least, I mean to show her that we shall keep at as great a distance from her as she chooses to keep from us, and that we shall not be ruled by her, the same as if she had natural feeling for us."

"Will this do, Anne?" said Pleasance, after writing a few lines, and then she read, "Madam, we are papa's daughters, and we should have done anything, as we ought, for papa; but as we have not known his relatives, and they do not mean to know us—even by name—more than they can help, and as papa left no message, either to us or to them, we beg to decline being further interfered with and disposed of only to satisfy their pride, and as we believe that we may be kept out of their way."

"Yes, yes, Pleasance!" responded Anne eagerly.

"It is too long a sentence, I am afraid," meditated Pleasance, holding her pen between her teeth, and considering her production with some pride.

"Oh, never mind the length of sentences," said Anne a little fretfully. "Who minds that, save governesses and masters?"

"But you used to mind governesses and masters so much," complained Pleasance wonderingly.

"What I used to do, and what I have to do now, are very different. Please, Pleasance, don't sit with that pen in your mouth," poor Anne wound up with flagrant inconsistency. "Oh, my dear, you must not get into bad, awkward habits, now that there is nobody to correct you."

"I have you, Anne," said Pleasance cheerfully. "I think I may just add this to the letter:—'We have each other, and we shall do our best, without seeking the aid of anybody. We remain your obedient servants.' That is the proper close of such letters, Anne, and we must both sign, 'Anne Hatton,' 'Pleasance Hatton.'"

So the letter, in its resentful imprudence and youthful heroism, was copied out in Anne's trim, clean handwriting, and signed by the girls.

Mrs. Balls knew nothing of its contents; it never entered the girls' heads to consult her. And if they had, the hot-headedness and rough recrimination which belonged to her want of education, would have overweighed the superior worldly wisdom of her years, and prevented her from dissuading her charges from sending such a letter to their nearest and most powerful relation. Even as it was, Mrs. Balls did hope, when Pleasance asked her about getting the letter posted, without any word of its contents (since Anne did not wish these to be spoken of), that the "gals" had done what they could to send away "sombry—grand relations, or schoolmistress"—for Mrs. Balls blamed all with whom the Hattons had had to do unquestioningly and impartially, for the scurvy way in which they had been treated, "with a flea in *their* lugs, to see how *they* 'ould like it."

By return of post there came a letter from Mrs. Wyndham bearing her husband's coat-of-arms. It was written with violet ink, and retained a trace of the perfume of her writing-desk. She accepted the discharge which her late brother's daughters had thought fit to give her from all obligation to them. She washed

her hands of them after the ingratitude with which the trouble and annoyance to which she had exposed herself on their account had been received, and after the utterly unbecoming tone which the girls—no doubt instigated by their mother's relations—had adopted towards her. The few hundred pounds which her brother had left behind him, and to which his daughters might consider themselves entitled, had been placed in the funds, and might be had, when the girls came of age, or sooner, by applying and showing such cause as would satisfy Mr. Fairlie, Lincoln's Inn. She did not profess to know law, but she believed the arrangement would be found right. She wished the girls well, and bore them no malice, though she feared, from the specimen of their dispositions and intentions they had shown, that they were not likely to pursue a course which would lead them to respectability and prosperity in their station. But as they had desired, she had done with them, although she must remain their father's sister—

"ALATHEA WYNDHAM."

This letter filled the girls, especially Pleasance, with triumph rather than any other feeling. They had attained their end; they were no more to be domineered over and taunted in cold blood, even on paper, by Mrs. Wyndham. They were their own mistresses, and if they had not liberty, what other good could they claim in their forlorn situation?

CHAPTER VI.—ONE WAYFARER FAILS.

THOUGH Anne Hatton's first attention had been turned to the wiping out of the affront which she believed her father's sister had put upon her father and his daughters, by their repudiating the brief authority which Mrs. Wyndham had exercised over them, Anne had not been without the consideration of plans for herself and Pleasance; she had been full of them, working at them incessantly with a restless, excited brain.

Pleasance was cherishing a diversity of schemes, and fitful, airy projects. Now it was that Anne and she should manufacture an immense number of little pincushions, penwipers, &c. The girls at the Hayes had lightened their heavier labours by contriving and constructing such for birthday and Christmas presents and charity bazaars in which friends of some of the pupils were interested. They could be disposed of to a "repository," whatever that might be, or wherever it might be found, and live on the proceeds—as Pleasance had read of distressed ladies

supporting themselves, in those good old-fashioned novels which Miss Cayley had not forbidden to her pupils.

Next, it was a new idea, culled from a modern American novel, that Anne and she should set up a little shop—only not in Saxford, where people stared and wrangled so, and girls were so saucy—and sell things, tea or worsted, or, better, books; or try to get a little farm, which Mrs. Balls would tell them how to take care of, and have horses and donkeys, and cows and hens, all of their own, and sell corn and hay, butter and milk, and eggs and cheese, like Mrs. Balls's master.

In these occupations Pleasance recognised a new life and many delights, with some cares, of course, but no degradation—how could there be? Anne and she would still be Anne and Pleasance, retaining all that was worth having of their individual selves, with their gifts or graces, and they would be doing what was honest and right under the circumstances. No more harm could come to them than came to Rosalind and Celia when they withdrew from the usurping Duke's court, and lived as shepherd and shepherdess in the Forest of Arden, or to Imogen, when she cooked roots for her unknown brothers in the cave of Belisarius. No doubt it would have been nicer to have been Rosalind and Celia or Imogen, but manners had changed, and people could not have everything they wished. She might well say that when poor papa had died away, all by himself, in the wilds of America.

Anne's great trust was in an application to Miss Cayley. She had not been so fond of Miss Cayley as Pleasance had been; still she had full faith in her old teacher's goodwill, and naturally retained an impression of her power and influence, much greater than the claims of even an old-established, respected schoolmistress could warrant.

Neither Anne nor Pleasance knew anything of a possible change in Miss Cayley's circumstances, as changes were not mooted in the school before they came to pass.

Anne was certain that Miss Cayley could do something for them if she would, and Anne was pretty sure that she would, though she could not be equally certain of what Miss Cayley might think of their letter to their aunt. But Miss Cayley, clever and good as she was, was not one of papa's daughters to judge how they had been hurt and humiliated, Anne reflected proudly.

If Miss Cayley could not take the two girls back into her own school as pupil-teachers, to be in a measure at the beck of

Anne's old school enemy, Maria Hollis—a galling transformation to Anne with all her sense—then Miss Cayley would get the girls placed together (Anne must be with Pleasance to look after her, what would become of Pleasance, in spite of her wonderful cleverness, if she were out of Anne's sight?) on a similar footing, in another school. In a few years the girls would have completed their education, and be fit to undertake a school of their own. The necessity of their being together, and the impossibility of Anne's letting Pleasance go anywhere by herself, precluded the notion of the sisters meeting fortune separately as governesses.

Anne's visions were only a little less impracticable than Pleasance's, but happily Anne did not know this, and was slightly comforted in her sorrow, pain, and misery,—for her present position involved these elements in the highest degree to the delicate, sensitive, womanly girl of fifteen—in contemplating the result of an application to Miss Cayley at a little distance.

There was no such pressing haste in writing to her as there had been in writing to Mrs. Wyndham. Anne's blood did not boil, and her fingers tremble to write the second letter, as blood and fingers had boiled and trembled to write the first. Mrs. Balls, their mother's cousin, was quite willing to have the girls for a longer or shorter time, and assured them that they did not put her about.

Anne could not deny to herself, and had difficulty in concealing from the others, that she was wretched at the Manor, where, indeed, the only previous visit which she had paid in very different circumstances had gone sorely against the grain with her. But she felt she would be wretched now anywhere, and the cold which she had caught, instead of decreasing, was gathering strength and preying upon her, inclining her to supineness. Not Anne's head alone, but her chest and side ached horribly at intervals. She could not sleep at nights for her cough; she could not eat, but turned loathingly from the homely luxuries which Mrs. Balls set before the sisters, with much unconventionality and unrestraint. When the first ceremoniousness of her cousin's children's presence wore off, Mrs. Balls fell back into her habit of eating when hungry, and drinking when thirsty off corners of uncovered tables, and in the midst of other and most incongruous occupations.

There was a certain charm to Pleasance in

taking tea, standing, with her hat on. She did not mind that Mrs. Balls never turned down her cuffs for dinner, and would rise up in the middle of the meal to go as far as the outhouses to see for herself what the lowing of a cow meant, or to fetch in a turkey's egg which she had forgotten, and feared might prove irresistible to a farm servant of doubtful morality, or to an egg-loving terrier.

But Anne did mind, and experienced continual chagrin and disgust from such ways. She wondered dully that she cared when so much worse had come upon her; but she could not help caring, and her lethargy was every now and then goaded into a longing for instant action, by the vexation of perceiving how readily Pleasance accommodated herself to the changed surroundings, nay, how she enjoyed them. She would chatter by the hour to Mrs. Balls, made a whole circle of acquaintances in the animal world of the offices, and poultry yard, was deeply interested in the lambs and calves, and proud to be allowed to feed the latter, interested even in the pigs, and absorbed in the sitting of hens, and hatching of chickens.

Anne was constantly dreading that Pleasance would make friends with more than the animal world, would degenerate into joining in Mrs. Balls's gossip, with Mrs. Morse of the Brown Cow, or Mrs. Blennerhasset, the blacksmith's wife, who seemed to have so much more time than ladies such as Miss Cayley had. They would saunter from the village to the Manor, to inquire into the prospects of Mrs. Balls's harvest of milk and cheese for this season, to buy and carry home little jugs of cream for tea, a basketful of new-laid eggs, or a couple of young hens for some special family supper, and would sit and rest, and refresh themselves with Mrs. Balls's cider and beer, while in their strong eastern Doric they pulled to pieces all the congenial topics of the village.

But Anne was not able to go back to the Hayes, if Miss Cayley sent for the girls on hearing their plight, till her cold was better. In the mean time it was hardly worth while to unpack the school-books, and set down Pleasance to her tasks. Anne would have set her down, though Pleasance's cleverness had placed her in the same class with Anne, and above Anne in the class, still the elder sister had never lost the supremacy over the younger, and could have wielded it, if it had been worth while.

Pleasance could not have lived at this time, even a week, without a book of some kind in addition to the little pocket Bibles

and prayer-books out of which the sisters had been taught to read their daily lessons—lessons of another description than mere school lessons, and out of which Pleasance edified Mrs. Balls by reading to her on the rainy Sunday after the Hattons arrived, so that Mrs. Balls could pick up the clearly-read words “jest as ’twere parson saying ’em.” Pleasance had taken out one of Sir Walter Scott’s novels, which was amongst her stock, and with that in her hand, or underneath her arm, and all the farm animals to study, she felt herself fully armed for occupation and entertainment till Anne should be well again.

Anne could not know that Miss Cayley had already received that call which she had been anticipating, and had judged herself bound to sell the goodwill and the fixtures of the school at the Hayes to Miss Smith, who had saved money, and possessed relatives in affluent circumstances ready to assist her with a loan, in order that Miss Cayley might pay her share of debt to a creditor poorer than his debtor, while she must begin life anew in another quarter. The school, left behind in all the engrossing amazement and turmoil of a sudden change of government, had already put the figures of the Hattons, with the nine days’ wonder of their abrupt departure, far into the background.

Though Anne was daily and surely growing very ill instead of well, Pleasance had been so long accustomed to her sister’s being pulled down and having to struggle up again under colds, that, after a momentary trepidation on finding Anne ailing, she thought little more about the matter. Mrs. Balls took alarm at last.

“It ain’t mere pining,” she considered, “the gal looks wus’n her mother the last time cousin Pleasance turned aside and come and seed me arter some of their travels—for it is my mind her gen’leman of a husband dragged the breath out on her body with his going here and there—her here may take arter the mother in more’n looks. Miss Pleasance?”

Mrs. Balls appealed to Pleasance, sitting reading in the window, while Anne had consented to remain in bed, being in fact no longer able to come out of it and stand without sick giddiness, “Did you ever hear say your sister were like to go into a waste?”

“Never, Mrs. Balls,” cried Pleasance, catching the words with her quick intelligence causing her to understand their meaning, so that she started up in dismay, flinging down her book, “how could you think of such a

thing?” Pleasance said angrily, the suggestion was so barbarous if it were not so absurd. “Anne has often had cold and influenza before, she only needs a little rest and nursing.”

“Sure-ly and softly, Miss Pleasance, I’m on’y a stoopid body that’s kinder frightened,” said Mrs. Balls cautiously.

“You may say so, Mrs. Balls,” said Pleasance eagerly, “if you had seen the little Mitfords in measles, or the Bovilles in scarlatina, you might have been concerned, but to take alarm at a cold!” and Pleasance picked up her book and walked out of the room. She sang as she went to the sisters’ bedroom and planted herself there, hanging about Anne, trying to get her to speak and smile, Pleasance’s eyes dwelling wistfully on Anne. When Pleasance could do nothing else, she loaded Anne with clumsy, often troublesome attentions, never quitting the bed-side, save to take her food, which she did by mouthfuls—rooted from that moment to the spot where her treasure was, yet all the time declaring that her treasure was in no danger, there was very little the matter with Anne, and that she, Pleasance, had no doubt Anne would be nearly well the next day.

Anne was not so ill as not to mark the change and puzzle over it.

Within the next twelve hours, in the middle of the night, Anne, who had been tossing about, started up in bed.

“What is it, Anne? I am awake,” said Pleasance in a troubled voice, and it was the first time that she had been found awake, save when she was the victim of tooth-ache, in the whole course of her life.

“It is the pain, Pleasance; it is back again, and so sharp in my side, it will not let me breathe.”

Pleasance stumbled up, and roused Mrs. Balls, who while slow to detect the approach of illness in a girl like Anne Hatton, was much more available when the illness was there, and had assumed a marked character. The Saxford villagers, with Mrs. Balls in their neighbourhood, did not walk in and out of each other’s houses, at all hours, and in all circumstances, and acquire no familiarity with violent sickness, or power of relieving it.

But Mrs. Balls’s applications only partially relieved Anne, and in the morning, while taking care to speak re-assuringly to Pleasance, Mrs. Balls announced that she had sent for the parish doctor.

“And I’ll send for passon, ere all be done, if I’m not far wrong,” she added to herself very gravely when she had closed the door

on Pleasance. "Eh, what a peck o' troubles to come on me, and wus on them poor gals!"

The doctor was a hard-worked man, with little time or thought to spare for one patient over another, and thinking almost entirely, as was necessary, of physical needs; yet he received an impression from the discrepancies between his patient and her sister, and his worthy old acquaintance Mrs. Balls and her

household. He stayed for a moment to listen to the mistress of the house's voluble explanation of the case, after he had told her that Miss Hatton's complaint was pleurisy more advanced than he liked to see, it must have been hanging about her ever since she had caught cold, she was certainly in a critical condition. He added, "You had better send for the young lady's aunt whom you speak of."

Page 120.

"I couldn't, and I ouldn't," said Mrs. Balls doggedly, "Why t'ould kill she—an it ha'n't killed she already."

"Very well, you know best," said the doctor, looking at his watch. "But remember I have warned you what may be apprehended, and you must take the responsibility."

Mrs. Balls was not inclined to take the responsibility entirely. "I'm a welly good

church 'oman," she said artfully to Pleasance, "and when so much as my finger aches I like to a' the benefit of passon's prayers. What do he be there for, an' it be not to preach and pray us well—soul and body?"

Miss Cayley had been a good church woman also, and the girls had been accustomed to see her clergyman, whose children were among their school companions, often

at the Hayes, preparing the confirmation class which was ready for him, every year. He had been a man fond of and familiar with the children—among whom his own were numbered—and willing to be of use to them, so that in their illnesses he had, when in the house, come up to their rooms, as much to speak a fatherly, cheering word of patience, as to read a short prayer to them.

Pleasance's short-sighted eyes, painfully open and strained already, only opened a little wider. It was not so much out of the ordinary course, that the clergyman, though a stranger in this instance, should come and see Anne, who had not been able to go to church. Pleasance thought what was true, that Anne would rather like it.

The clergyman of Saxford and the neighbourhood was nearly as hard worked as its doctor, and he was not so well able for his work. He was a good, but gentle, shy man, with little imagination; and though his conscientious labours had doubtless made their mark out of sight, in what was seen it did not seem that the vicar had coped effectually with the thick slough of agricultural ignorance, which had at Saxford an admixture of wild self-will, derived from the vicinity of the village to the sea-port of Cheam.

The vicar saw nearly as many sick-beds as the doctor, and had to do his work there much more in the dark, so far as his patients were concerned. Vicar and doctor, when they paid their hurried visits to the Manor, were following each other to the death-bed of the head of a family, a careless liver, like many in that parish, and who was leaving a large helpless family behind him.

Mrs. Balls poured into the ears of the cumbered vicar, as she had poured into the ears of the cumbered doctor, the tale of the Hattons' tribulations, and as in the former instance, the vicar, after seeing Anne, praying with her and exchanging a few words of not insincere but formal kindness with the girls, said to Mrs. Balls as she was showing him out, "You had better send for the poor young lady's aunt."

"Bor!" exclaimed Mrs. Balls, quite forgetting to whom she was speaking; "she mun be wuss, and past hope afore I do; and if I evened Miss Pleasance to that, she 'ould fly at me, poor mawther, like June a-guarding on her puppies. Both them gals hate the wumman as if she were pisen, they han't been able to take her name into their mouths, sin' the night on the day she druv them out of their school and they were forced to come here."

"I think you must exaggerate matters," said the vicar, mildly; "I cannot suppose that girls would be so vindictive, and in so undesirable a frame of mind. They appeared nice-looking, well-behaved girls when I was with them. I fear your patient is very ill; but I have not another moment to spare. Think over what I have said, Mrs. Balls."

"Dang it!" said Mrs. Balls to herself, looking after the vicar's retreating figure, still oblivious of her words and their relation, "it d' be little help men, even with the most know, give a poor wumman."

Mrs. Balls returned to Anne and Pleasance, and found the one too accustomed to illness, and too nearly sinking into sick stupefaction from the medicine which she had taken to allay fever, to be awake to a sense of danger, and to extraordinary measures in keeping with extraordinary circumstances. And Pleasance's set face of resolute incredulity, like a mask, was so strangely unlike her natural mobile face that it alone brought the water into Mrs. Balls's eyes. "Young though she be, she be bound to kick again the pricks, and we dunno want Scriptor to tell us, that be main hard pricking."

The next day the doctor was so busy with a mother hanging between life and death, after the birth of the last of her seven young children—in addition to the father of that other helpless household, hovering on the brink of leaving it desolate—and with the two sufferers living three miles apart—that he could only look in for five minutes in his rounds, and when he saw his presence was to be of no avail at the Manor, deliver his weighty sentences to Mrs. Balls.

"No better; considerably worse; the disease running its course, with still less stamina to resist than to feed it; might take a sudden fatal turn any hour; the patient to be closely watched, whoever was sent for."

The vicar came and heard that Anne was asleep—a sleep heavy, yet restless, from which, with passionate yearning, Pleasance hoped everything, and built herself up in the hope, almost with childish exultation. But Anne awoke (oh, the woeful awakening to Pleasance!) manifestly more choking for breath, with a greater tendency to light-headedness than before. In the meantime the vicar had gone, leaving his compliments and inquiries.

Mrs. Balls had done everything that she could think of, except bring in some of her village cronies to exercise their skill and pronounce their opinions without reserve upon Anne. Pleasance opposed the idea,

when it was hinted to her, at once and so vigorously, as being totally uncongenial to Anne, that Mrs. Balls dropped it, without farther ado, contenting herself with long gossips in the kitchen and loud whisperings at the house door with friends dropping in, and with the more confidential of the farm servants.

That night Mrs. Balls made her preparations to sit up with Anne, and Pleasance did not dare to object, while she herself had to lie down in her usual place in order to content Anne, who through the gathering haze of sore illness and partial delirium, would still have refused to rest, if Pleasance had not been, as was wont, by her side.

Mrs. Balls, after her elaborate arrangements, soon fell fast asleep in the chair, a little back from the bed, in which she had stationed herself. Pleasance, who had not slept for two nights, save by the shortest snatches, and who felt as if, however stiff and aching her body might be, she should never sleep again, lay in forced stillness in the dim light of the unsnuffed candle, and held her breath as if she needed to hold it, to listen to Anne's laboured breathing, and to pray over and over again a piteous, desperate prayer to God to spare Anne to Pleasance.

In the middle of the night, about the same time that Anne had aroused Pleasance to Anne's access of illness, two nights before, she started up again, with the torpor in which she was lying as it were rent asunder, and nervous acuteness restored to the soul looking out of the gleaming eyes, set in the little face, chalky white where it was not burning red.

"Pleasance," said Anne, panting to find breath to speak, "I am very ill."

Something clutched like a vice hard and cold at Pleasance's young heart, but love gave her simple wisdom and strength to answer, "Yes, Anne, but we are doing all we can to help you, and oh, we hope you'll soon be better."

"I'll never be better," answered Anne, with the same startling, gasping energy, "and I brought it on myself, for I could not make up my mind to the change, I took it so to heart. Oh, I'm sorry now," she said, with the clear sight and the deep regret of the dying, "for we had so much left—each other, youth, health, breath"—Anne struggled to say the word, while her breast heaved for the thing which the word expressed—"the sun in the sky—we might have been happy yet."

"Please God, we'll be happy yet, Anne," implored Pleasance.

"Not here," said Anne. "Oh, Pleasance, I'm frightened."

The last alarms had seized on the timid creature, and a scared terror arose in her eyes, while the sweat drops gathered on her forehead.

"Anne, Anne, you were so good," said Pleasance, rising up on her knees in desperate appeal from Anne against herself, back again to Anne, and to another than Anne.

"No, no," Anne shrank still more at the assertion, "I was bad when I had the chance—I have been hating that woman, and despising Mrs. Balls who took us in, I have been angry with you—and even without all that, to go out alone into the darkness, with nothing beyond save the great white throne, Pleasance, Pleasance," Anne cried for help.

At that great and bitter cry what had remained of the childhood of Pleasance, with its lightness, thoughtlessness, and irresponsibility, died out as in a moment and for ever. She answered the cry; she must answer it. It seemed as if she had capacity enlarged and power given her—she knew not whence—to answer it. She half supported Anne, as Pleasance knelt in the bed, and held in hers the fluttering, chilling hands.

"Anne, I cannot go instead of you, I cannot go with you, but think of God in Christ, Anne," said Pleasance in a voice clear, well-nigh loud, which she could not have recognised as her own, which nobody could have recognised, "think of our Father in heaven to whom we have gone every day of our lives, and not only when we were confirmed and took our communion together last month—and we meant it, though we might be very silly and foolish. But Christ knows our weakness, and will not condemn us for being weak."

"Say it again, Pleasance, speak of Christ," said Anne.

And Pleasance spoke; she never knew what she said, but Anne, though her breath came after longer intervals and with huskier, more rattling impediment, became more composed. Or was it a film gathering before her eyes, a ringing in her ears, and a numbness stealing over her excited brain?

Once again she threw off the stupor and stretched out her arms while Pleasance held her hands, as if Anne did not feel Pleasance's touch, but was groping after it.

"Oh, what will you do, Pleasance? how can I leave you?" moaned Anne.

"Never mind me, dear," said Pleasance, with generosity's last best effort.

Mrs. Balls had her sleep—in which she had been dreaming of her cousin Pleasance, young and blooming—broken in upon by the noise. She started up and came towards the bed.

"Eh! my lass, what's this?" she cried, and then she did nothing; but stood while the ruddy streaks of colour in her complexion paled, and her lips fell apart. She was waiting humbly in the presence of a Sovereign before whose surpassing greatness the great and small of the earth quail alike. She did not even seek to remove Pleasance from the cramped, crouching position which she had assumed, that Anne might cling to her, partially raised on Pleasance's shoulder, till the only sound in the room had passed with a faint sob away, and there was silence which could be felt.

Then Mrs. Balls came forward and touched Pleasance, at the same time disengaging Anne's drooping figure from her sister's hold. "It d' be over, my dear; she's gone."

Mrs. Balls half expected Pleasance not to believe the intimation, or at least to resist the conviction and cling to the dead with frantic outcry; but the awe of the journey on which Anne had gone was on Pleasance. With the awe there was the anguish of a loneliness which pierced through the unreality and the exaltation of the last few moments, when Pleasance could not tell whether she herself had been in the body or out of the body, and smote Pleasance as with a sharp wound. Unless Christ in heaven, of whom she had spoken to Anne, and who might be so near and yet was so far, she had nobody now. Papa was gone; Anne gone. Pleasance clutched Mrs. Balls's gown and her head fell heavily on Mrs. Balls's breast. She suffered Mrs. Balls to lead her from the room. Pleasance knew, with a knowledge which thrilled through every nerve of her body and every perception of her soul, that Anne was there no longer to hear and to answer her.

CHAPTER VII.—AT THE BOTTOM ALONE.

PLEASANCE'S grief was a dumb grief. She was stricken in her turn still and motionless as Anne had been under a different shock. Mrs. Balls was appalled at the transformation of her former lively companion, and at the manifestation of a sorrow which was past her comprehension, being so unlike her own loud groans which brought quick relief and the free pourings forth of her troubles which lightened the burden.

"It mun be in their blood or breeding—so the poor quiet gal that's gone sat like a stock or stone for the few days she were here—till I lay the blood congealed at her heart and the mortal affront strook to it. What's the use on so much know, when it on'y makes men and wummen so thin-skinned in theys souls that they cannot stand a dunt, or cry out and 'a done with their murnin'. Frien's is all very well, but frien's must part, we all know that, and we ain't singular when it is our frien's as are took, so where's the good o' over much frettin'? Let the gals be fond on each other, poor mawthers, they had none else to be fond on—till they had got young men of their ownst, and then they might 'a got more sorrers—while they were here; it 'ould never have been me that 'ould said one word again it; but now that t' one is took, is t' other to quarrel with her wittles, and sit and petrify into a moniment for lack of her sister? I call that a fair flyin' in the face o' Providence."

But Mrs. Balls had not the heart to remonstrate roughly with Pleasance, in place of roughness she showed the girl all manner of homely tenderness, and she consulted both the doctor and the parson on her account, as she had consulted them on Anne's behalf, in vain.

The doctor, though far from an inhumane man, was provoked at being plagued with a trifle, when he had so many matters of life and death on his hands. "Tuts, tuts," he said, "grief does not kill—at least, not often, and this girl has not her sister's constitution, she is a well-grown, strong girl—let her alone, she'll come round; if she do not sleep of nights, she may have a drop of your hot cyder, or if her stomach is too dainty, a glass of sherry-negus, that's all she'll need."

The vicar talked and read and prayed with Pleasance, gently and earnestly, bade her be resigned, give her sister and trust herself to God, and what more could he have done?

Pleasance was sensible of his kindness, and even said a single word of thanks to him "prettily," to Mrs. Balls's satisfaction, though she was too miserable to respond to it in any other way. How could he, more than any other man, tell her where Anne was gone, or what was her present state? How could he fill the yawning chasm in Pleasance's heart and existence? It was easy and no doubt right for him to bid her be at peace, but how could she rest or look up with one-half of her gone?—for Anne was like part of her, and that part was torn

from her by a violent wrench and laid out of sight and sound in the cold grave.

It seemed more practical for the vicar to give his assistance to Mrs. Balls in announcing the death to the girl's relations, and arranging with them for the funeral.

But here the good man was again foiled. Mrs. Balls would not have the gentlefolks apprised. They had dealt with the girls, their own flesh and blood, not so far removed, as well as her flesh and blood, "wus'n dawgs"—clad the elder in her winding-sheet, and broken the younger's heart and spirit. It would be mockery to summon the cruel kindred to see and rejoice over their wicked work.

Mrs. Balls, independent in her views, as indeed were most of the natives of Saxford and Cheam, would not see things in a softened light, and preserved her wrath and disgust in spite of the vicar's puzzled protest.

No; she would not speak to Miss Pleasance, the poor child was not fit to hear such matters discussed, and was incapable of deciding one way or another, and Mrs. Balls would decide for her. Her cousin's child should not owe her burial to the grudging donation and reluctant attendance of the relations who had compassed her death. Why, the very dead would rise from her coffin to oppose such a misdeed.

Mrs. Balls had heard that the two girls would succeed to some money (she rated it in her own mind at perhaps twenty or thirty pounds), but neither would she take from it a sum wherewith to discharge the expenses of the last offices to Anne. Miss Pleasance would have enough need of the bit of money which had come all to her in God's Providence, and she was heartily welcome to have it untouched. Mrs. Balls would defray the cost of Anne's funeral, she could afford it; and it was all she could do for the girl, her cousin's daughter, who had come to her in her need, and whom she had kept for so short a time.

The Vicar, however he might differ from Mrs. Balls as to the judiciousness and propriety of the intention, had no power to prevent its being put into execution.

Pleasance took all that followed passively. She was, as Mrs. Balls said, quite too young to rouse herself to enter into such details. And young as she was, she was walking through the valley of death as it were on her own account, as well as on that of another.

For Anne was, indeed, part of Pleasance, the two sisters had grown together side by side. Pleasance never remembered a time when she was without Anne to look up to,

and to refer to in her stage of seniority, and prematurely developed, old-fashioned precision and staidness, equal to all ordinary demands—back to the period when Pleasance could faintly recall her sick and sinking mother, and her absent-minded, harassed father, by both of whom she had been constantly turned over to Anne's safe keeping.

Anne had been mother and sister in one, watching and providing for Pleasance's well-being, even before the two little girls were committed, on their father's going abroad, to Miss Cayley; and though Pleasance had been afterwards in the charge of Miss Cayley and of sundry governesses, she had always been under Anne's protection and guidance in the first and nearest sense; and it had been with reference to Anne, more than to any other person, that Pleasance had never yet stood alone.

All through these years of childhood and growing girlhood the sisters had been thus united, ministering to and dependent the one on the other. Anne had not been utterly incapable of youthful giddiness and self-absorption; but she had never been seriously unfaithful to or forgetful of what, without direct words from her elders, had been her trust. Pleasance, with her far greater ability and wider sympathies and aspirations, had been saucy and cross at times, but she had never seriously questioned or rebelled against her sister's authority. She had stood above Anne in her classes, she had regularly coached Anne in their lessons; but out of the class and apart from the lessons, Pleasance had been a child to Anne, and had continued more of a child to the rest of the world, because of the existence of that primitive relation.

Until that miserable morning at the Hayes, which had brought to the Hattons the tidings of their father's death, and sent them out into the world, Pleasance had not once raised her voice and given an independent decision on their joint juvenile affairs.

Until that last night, when in its piteous, dreary watches Anne had cried in her extremity to Pleasance, and Pleasance had risen in her whole being to answer her, Pleasance had not consciously come to a single conclusion for herself, or taken practically upon herself to settle one of their difficulties.

Now she was a young girl maimed and shattered in spirit, as well as desolate. And as the poet holds that the frost of death may at one touch ripen the soul, so the frost of sorrow had, in these few days,

ripened wonderfully, and in the circumstances terribly, Pleasance's capacities for loving and suffering.

Not a month before, in their ordinary school life, Anne had been the more proudly devoted and attached sister of the two; but had Pleasance died then, Anne, in her loving lamentation, would have been more open to resignation and consolation than Pleasance was in these later days. Anne had been prostrated by the very strangeness of the overthrow and destruction of all her hopes for the present and the future; but if her father's death had come in the course of nature, and had not been followed by any humiliating disastrous revelation—if even Pleasance had died in the same course of nature—Anne had in her far more of the instincts of submission—religious and reasonable—to God and to the inevitable, than Pleasance possessed.

Pleasance, in whose heart there sprang forth at one stroke a flood-tide of love, which had lost its object and could find no outlet, and which in place of fertilising her nature, seemed only to have risen there too late to devastate it, had to contend with the strong young spirit which cannot surrender its treasure without a desperate fight—not the less keen and wild that it is altogether desperate from the beginning, which has to strive in the dimness and ghastliness of a very place of dragons, where reason is fettered, and faith is tottering, and love is bleeding at every pore, to answer questions which are unanswerable in this world.

In the farm-kitchen beside Mrs. Balls, who carefully tended Pleasance's body at this time, but was as incapable of so much as entering by the outer door into her spirit's tribulation, as all other men and women were incapable of passing into the inner sanctuary where the struggle was waged, Pleasance, a young girl of thirteen, had to maintain and survive the warfare. It is perfectly possible, though it cannot happen often, that such warfare may come to a girl of thirteen, as to a woman of thirty; and if the girl survive it, she far more than the woman will bear its traces to her dying day.

In order to survive it there must be—not as Pleasance was sometimes tempted to long for, in the heat of the conflict, sickness like Anne's, bodily disease of some kind, if not to cut her down also, to counter-balance and neutralise the anguish of the spirit—but the fresh vigorous constitution like Pleasance's, which in the middle of its distress retains the power of refreshing itself—

though it be but to renew the encounter—by intervals of such utter weariness, as in a healthy body and spirit is followed by blessed oblivion and profound rest.

And there must be occasional Heaven-sent glimpses of far-away victory and restoration, re-union and complete explanation—surely divine as they are brief—bathing while they last the tempest-tossed soul in a very radiance of light and balm of peace.

There must be also occasional outbursts of more child-like and woman-like grief, to relax the strain and give temporary lightening to the overcharged heart. "God help our women," says a writer, "when they cannot weep," and God will help those women and children whose strait is beyond weeping, to weep at times, and lose themselves in a very rain of tears and storm of sobs, until their grief and its expression is for the moment spent together, else they would go mad or die.

So Pleasance lived through the dark days, not even perceptibly worn or haggard, she was so young, until the day of Anne's funeral. She was to walk at it along with Mrs. Balls, wearing one of the black calicot gowns which Anne had provided and partly made as their mourning for their father, and to which Mrs. Balls had added, without being able to draw a choice from Pleasance on what was to the elder woman an important subject, a black woollen cloak and hood, such as were commonly worn by women of different degrees, who acted as chief mourners at funerals in the neighbourhood of the Manor. Pleasance, to Mrs. Balls's surprise, was quite calm both in anticipation of and in realisation of the ceremony.

In fact it was a relief to Pleasance to be doing something—however dimly remote—for Anne, and undergoing a hard ordeal, as she knew Anne would have thought it, for her sake. It was one of the tortures of Pleasance's newly called forth streams of love to feel that they were wasted so far as Anne was concerned—to recall all that Anne had done for her, and know that never again in this world could she do anything for Anne, to show the depth of the gratitude which had so long lain dormant, and which had taken every benefit as a matter of course, or the fervour of the affection which had been wont to be shallow and careless, as if a day like this might not come when no service could be either rendered or received.

When the death-bell began to toll at the little church of Saxford, and to have its tolling carried on the wind so far as the

Manor, Pleasance started and shivered a little, but she recovered herself the next moment.

The funeral party consisted only of Mrs. Balls and Pleasance, with two of the undertaker's men, and four of the under servants on the Manor farm. The vicar was to meet them at the little church. The doctor had too much to do keeping the living out of the grave to think of following the dead to their long home.

When the coffin had been carried out by its bearers and they stood before the house where there were no hearse and no coach, as the distance was short to the country people, Mrs. Balls called Pleasance from the room where she had sat apart, put the girl's arm on hers to support her, and the procession started.

They followed the same road by which Anne and Pleasance had walked to the village with Mrs. Balls the day after their arrival; and the day, though much less dreary than the former, was still not altogether different. There was yet a spring haze on the meadows, such as often lingers in spring and autumn in these regions, but it was light and floating with the sun gilding it, and the pale blue beyond; so that the mist in place of hanging heavily over and obscuring the fields, the windmills, and the barges, seemed only to veil them with a slight indefinable grace, and to serve to bring out more vividly the green, and grey, and brown colours.

Pleasance was conscious of the kind of day, though she walked as in a dream; there even stirred within her in connection with the consciousness, a passing memory of the daffodils which she had been going to gather by the Covey woods the day Mrs. Wyndham came to the Hayes.

It was the same village, with the same people in clusters at their doors, staring still, but refraining from jostling Mrs. Balls and Pleasance as they passed by, on this occasion.

When the coffin was lowered into the grave, and the vicar strewed the earth upon it and said, "Earth to earth, ashes to ashes, dust to dust," Pleasance started again and shivered, with a stronger shiver than at the first sound of the bell, but she did not cry beneath her hood, as Mrs. Balls was crying; and when the service was over, and Mrs. Balls said, "Come, my dear," Pleasance took one long look and turned, and went as she had gone from the room where Anne lay dead.

CHAPTER VIII.—A NEW LIFE.

PLEASANCE came out of that time as a half-drowned man is restored from death-in-life insensibility, or as a sick man leaves behind him the grisly phantoms of fever. She was but thirteen, and had a sound nature, and a good and honest heart in which God's grace was stirring.

Pleasance must return to life and do her part in it, she knew that, as well as that Anne was no longer there to do it with her. The remembrance of Anne was vivid, and not half effaced like those of her mother and father, and would be cherished by Pleasance and remain a powerful influence in her life; in that sense Anne was still there, and for anything that Pleasance knew, Anne's spirit, which had so craved to help her, might behold and care for her younger sister from the skies. Pleasance wished that with all her heart. But in no other sense was Anne there.

Pleasance had never been able to feel, when standing in Saxford churchyard, that it was Anne who was under the nameless mound, where the newly-cut turf had not had time to grow green. It did not signify that the mound remained before Pleasance's eyes for days and nights together, that she was sometimes drawn to it as by cords to try if the sight and touch of it would allay the ceaseless aching void in her heart and life, and that she had vexed and frightened Mrs. Balls several times by slipping out and going along the village road, and up to the church and churchyard, careless of any remark which she might provoke from the rude village girls who had annoyed her, on her first appearance in the village. After she had attained her object, "and gone to the grave and wept," or stood dry-eyed there, she could hardly even realise that it was Anne's grave. No, wherever, or in whatever spiritual state, Anne might be, this mound could be nothing save sacred earth and turf to Pleasance, and could have but a temporary association with Anne.

Therefore, though Pleasance, for the sake of the association, would have a reverent tenderness for the churchyard and the grave, whether she was near or far from them, and would go many a time to look on them, she soon ceased to seek Anne there.

Pleasance understood that she was alone in the world, and must take her course, irrespective of what had gone before, and, under Providence, she shaped it for herself.

April had given place to May, with blue iris and golden wallflower in the remnant of

what had been the old Manor garden behind the house, and soft tender green leaves on the late chestnuts and walnuts at the foot of the old garden.

The busy season, the crown of the year in Mrs. Balls's life, what gave her position and importance, was coming to her. The Manor, like other farms in a county where farms merged into downs, and into the flat sandy coast of the German Ocean, was partly a grazing, partly a dairy farm. In the first months of the year a herd of calves were reared on the farm to keep up the supply of oxen in the far-stretching meadows, but with early summer the calves were weaned, and the milk was turned into the composition of cheeses, for which the Manor had a local renown.

The cheeses were Mrs. Balls's department, she took an interest in the cows and their produce all the year round, but apart from the cheeses, the cows were deputed to other and to masculine care, in order that Mrs. Balls might concentrate her power on her own speciality.

Though the cheese season lasted only from May to September or October, the limitation was far from implying that Mrs. Balls's office was a sinecure. While the season lasted, she and her subordinates—young women who were hired for the time from the village of Saxford—worked almost as hard as reapers on a harvest field, or as the women who came from the far north to the sea-port of Cheam, when the herring shoals were off the sand-banks to assist in the unsavoury task of curing the herrings.

Neither was the labour lightened by scientific contrivance, as on some of the great cheese farms of England. Mrs. Balls's master, the old squire, had been averse to improvements, and his nephew and heir, Lawyer Lockwood, who retained his profession, and for the most part its title, in a quarter peculiarly given to bestow titles, threw his energy into whatever litigation he had on hand, and was content to keep his farm with its considerable profits as he had found it.

The tubs of milk stood as they had always done, in long rows in the out-houses, each woman still squeezed and ladled the green whey from the milk-white curd, and when it was firm enough to be put into a mould, carried it out to be pressed under one of the equally long rows of heavy moss-grown grey stones screwed into frames which were ranged, under a rude wooden shed, down one side of the old garden.

The working of these frames, the putting in and taking out, reversing and paring into shape of the cheeses in the moulds, and the depositing them and turning them daily, till they dried on shelves fixed with due consideration of light and air in the empty rooms of the Manor, formed the laborious sequel to the first process.

The mere anticipation of all the bustle and trouble, and the anxiety lest her exertions and the good milk with them should be wasted, and Mrs. Balls's character be for ever sunk in the eyes of authority by a summer of spoiled cheeses, were now engrossing her mind, and slightly weighing upon her spirits, though she was naturally a lively active woman, who took kindly to hard work and honourable responsibility.

The melancholy episode of her grandly-married cousin's children, with their reverse of fortune, and Anne's death, of which Mrs. Balls, according to her philosophy, felt without any unkindness that she had already had enough, was driven a good deal out of her mind; she nearly forgot Pleasance creeping dejectedly about the Manor and its garden, and silently eating her meals. It was to a pre-occupied, engrossed woman, though only with the contemplation of the clean tubs, and ladles, and pitchers for the whey, standing ready for the fresh cheese-making, that Pleasance went up, as Mrs. Balls stood with her arms in her sides in one of the Manor out-houses, and said, "Mrs. Balls, I am going to ask you the greatest favour that you ever were asked in your life."

"And what be that, Miss Pleasance," asked Mrs. Balls, a little absently, though she was sufficiently impressed to turn round and look at the speaker.

Pleasance in her black dress had lost entirely the childish air which had lingered about her expressive face and well-grown girlish figure at the Hayes. Her very brown hair which used to have a juvenile unruliness that had cost Anne much concern, seemed to have laid aside its exuberance and irrepressibility as it remained drawn tightly back, and plaited into a knot at the back of the head. Her black cotton dress hung in regular undisturbed folds, and the wide white apron—of which Mrs. Balls had counselled the adoption—added the last touch of care and thought to Pleasance's dress.

"Mrs. Balls," said Pleasance again with great seriousness, "will you give over calling me 'Miss Pleasance,' and let me be from

this time Pleasance, and like your own niece or child? Will you put me at one of those tubs with the other girls, and see if I can earn my living as they do; and if I can, will you let me stay on always amongst them and be one of them?"

"What 'a took the girl!" exclaimed Mrs. Balls, sitting down in her surprise on an empty tub stool, "you ain't fit, mor, for such work."

"Yes, indeed, Mrs. Balls," urged Pleasance, "I'm very strong, else, don't you see, I should have been ill before now?" she added with a little weary sigh. "I have always been a strong, hardened kind of girl, for I think hardy must mean hardened, after all, and you should see that I would not shirk work, or be nice and full of fancies. Of course, if you do not like it, it cannot be, but oh, if you would only let me try, for it is the only way I can think of to take to now."

"Miss Pleasance, my dear, you be right welcome to stop here and 'a the best I can give you, without soiling your fingers. You d' be my own cousin's child, and I 'a nobry in the world nearer to me, leastways in this part. I 'a never married, and I 'ad ne'er a sister, your mother were bessern a younger sister to me, when we were together. My brothers 'a done well for theyselves, without needing from me, about them founderies, Birmingham ways. I know this is a poor place for the likes on you, but if you care to bide on as you are——" Mrs. Balls spoke from the impulse of her warm heart, on the moment, making a proposition which her slower reason would not have ended in justifying; for that matter, it had already caused her disquiet that Miss Pleasance should be living on, moping and wasting the months in idleness with her, and she had planned consulting her parson and her squire, Lawyer Lockwood, on what could be thought of for Pleasance.

But Pleasance did not avail herself of the rash suggestion.

"Live on idle with you, Mrs. Balls, and you telling me that you will not know where to turn, but will fall asleep with sheer weariness on your very feet for the next four months, you could not suppose that I would do that," said Pleasance, in a hurt tone. "I am sure that would be a hundred times worse than anything else."

"You would be throwin' away of your fine edication," urged Mrs. Balls, to whom throwing away anything formed always one of the greatest scandals.

XVII—9

"Yes, my education is there," said Pleasance meditatively, "it is part of me now, and I cannot get rid of it. I cannot throw it away, as I might be tempted to do; but must it stand in my way? can it do me much harm?"

"It ain't harm, but good, it ought to do you," said Mrs. Balls; "why, if we looked about, and set friends to inquire, we might hear of some schulin that you might do."

"I don't think anybody would trust me to do it for a great while yet," said Pleasance. "The youngest governess at the Hayes was four or five years older than I am, and I should be losing some of the things that teachers must be able for in the meantime; and I don't wish it, Mrs. Balls; I don't wish to go among people who might turn and break my heart," ended Pleasance in a low tone of suppressed emotion, the determined suppression of which was noticeable in a girl of her years.

"I ain't again' you there," said Mrs. Balls emphatically; "them is happier in my mind that's below tants and gibes; and a footing that is atween servant and mistress, and neither one nor t'other, is the most ticklish footing on all. If you could bring your mind to being like your mother was, afore she had the misfortune to meet your father, a hard-working, bloomin', happy village lass, though come of good yeomen people; but it can't be easy, though you may think it, arter you 'a been reared among gentle folks; as soon rear chicks at your kitchen fire on oven crumbs, and then send 'em to scrape for seeds in the mire of the yard."

"I told you I was hardy," said Pleasance, "and what others could do, I could bring myself to do; the roughest work is no disgrace; we were not taught that at Miss Cayley's. I know it would not be easy, but I don't want easy things now, even if I could get them. I want to work hard, not to be able to think and remember too much," said Pleasance with a quaver in her voice; "and to be very tired at nights, so as to go to sleep at once."

This was the first hint that she had given Mrs. Balls of the desolation which crushed the girl at night, when she went to the empty room and bed which Anne had always shared with her.

"My poor brave mawther!" said Mrs. Balls full of pity, "you don't know what you're saying; that's about it."

"I always thought that I should rather like to keep a shop, or have a farm," continued Pleasance hastily, shrinking from pity,

and trying to give a lighter turn to the conversation.

"Bless us! cheese-making ain't having a farm," said Mrs. Balls, shaking her head at the folly of the comparison. "Dunno you think"—she stopped and hesitated, for Mrs. Balls was one of those women who have a strong repugnance to mention the name of the dead on ordinary occasions, and who keep it for solemn seasons, much as religious books are kept for Sundays—"she ouldn't 'a borne your coming down to the ranks. She ouldn't 'a liked it."

"I have thought of that, night and day," said Pleasance eagerly; "but that was not what she said at the last. She was sorry we had minded so much what we had lost, and she must know still better now. Oh! Mrs. Balls, if Anne knows anything at all of what is passing here—where she is—she must know that I cannot go on without her, as I should have done if we had been still together. I should miss her every moment, I should fret my heart out, I could not do it."

"Softly, softly, Miss Pleasance," said Mrs. Balls, having an objection to Pleasance speaking of what the dead might know or might not know; "it were profane-like," meddling with what we had no business with, to her practical, yet compliant and complacent nature. "You ouldn't think though it goes again' my own stummach, just writing a word," said Mrs. Balls, with some thought of her own responsibility, "to the fine lady, your aunt."

"No, no!" cried Pleasance, flushing purple and then waxing as white as Anne in her coffin, and going on to speak with a vehemence that quivered through her whole body, and which caused Mrs. Balls to start to her feet and mutter to herself, "Laws! she ain't gone into a frenzy!"

"Don't speak of her, Mrs. Balls. I try to forgive, I pray to forgive her, as Anne must forgive her now; but she killed Anne, you know she killed Anne, as I think it would kill me to see her again, or to go among people like her, and have it all to bear over again."

"That you shan't," said Mrs. Balls decidedly. "I ain't the one as 'ould drive you to be put upon; and if you like to try your hand at dairy-work for a change, as good as a play for you, till you see if you like it, or could ever take it serious, it may do you good, I see. no objection, I says, as long as you are with me and can be spared."

"But you must not spare me, Mrs. Balls; I won't be spared," said Pleasance, speaking

cheerfully in the manner that Mrs. Balls liked, to show her gratitude, while Pleasance was still shaking with her recent agitation.

So Pleasance—in her shabbiest old gown, with sleeves and skirts alike tucked up, and further protected by a still more extensive apron furnished with a bib—took her place in the row of tubs on the first day of the cheese-making, amidst stares and giggles and nudges to each other from the Saxford girls, but amidst no worse, because Mrs. Balls was mistress in her own dominion.

Pleasance felt no degradation, as she might have done, even in spite of the teaching—more generous than usual—of Miss Cayley's school, if she had been sent against her will to such a post.

And, however wearied, she did not give in or withdraw, but remained squeezing out and ladling the green whey from the fresh supplies of milk, along with the most tried and trained workers. When the girls saw that not only she did not shirk her task, and would not accept unnecessary assistance (which, dissembling their hostility in order to win favour with Mrs. Balls, the girls would have given her), but that she watched what the others did, and was emulous to do the same—to strain as much whey, to carry as heavy a burden of curd, to screw the cheese-press for herself at the risk of letting it down on her fingers or her toes, all the while steadily refusing such rest or refreshment as was not granted to the girls in general, but would have been allowed to her—a shade of wondering respect began to mingle with their contemptuous toleration.

Pleasance continued to work amongst the dairy-girls till they grew accustomed to her presence, and freely exchanged in her hearing the usual gossip with which they lightened their labour. She heard a good deal that was small and silly, as indeed she had heard as much at the Hayes, and a good deal more that was far coarser in tone than any previous conversation that had ever reached her ears; but she heard nothing that was positively bad, because there was not above one bad girl, at the most, among the rough Saxford girls gathered together at the Manor, and her badness was kept under by the preponderance of goodness, such as it was, and by the neighbourhood of Mrs. Balls.

Pleasance heard how Sally Larkins had appeared at church with a bran new shawl; and Kitty Blennerhasset had taken out a smelling-bottle as if she were sick, and caused everybody to laugh, and parson to look round; and 'Arry Owen had been and

had words with his master, because he had been as tight as tight could be when Car Reeves had sat hours with him in host Pearson's alehouse to try and get him out, last fair at Applethorpe; and Bill Nobs had smashed his wife in drink the night before last, and given her two black eyes, and butcher Smith had cut a paring off a beef steak for her to tie over them while she was in bed—serve her right, for she were always a worrying other people when she could not get at her man.

At another time, Pleasance, with the quick curiosity which belonged to her age and cleverness, would not only have listened and been interested, but would have asked pertinent questions, and possibly made comments on all which struck her as odd; but she was not merely languid from her recent great sorrow, and could only let pass—as if it were at a distance from and only within sound of her—the girls' idle chatter, but it seemed as if that sorrow had put a gulf between her and them which she would never be able to surmount.

On their side the girls were secretly styling Pleasance a proud, stuck-up thing, and saying if they had her away from old Moll Balls, they would give her a bit of their minds, and let her see what they thought of her coming in among them, and taking up a place at a tub.

As it was, protected by Mrs. Balls, and kept up by her own resolution, Pleasance's attempt at dairy work proved a success. In a few weeks she grew as expert as any of the younger workers—nay, as the spirit in her would not be beaten or outstripped, she would achieve quite exceptional feats, for her age and strength, in the number of cheeses which she put through her hands in a given time, together with their creditable quality. Mrs. Balls became quite proud of her cousin's proficiency, and insisted on seeing her paid with the usual wages, which, however, Pleasance was equally firm in transferring to her hostess as a small payment for her board.

Long before the end of the cheese season Mrs. Balls had learnt to say "Pleasance" without any ceremonious prefix, to feel what a nice thing it would be for her, Mrs. Balls, now that she was getting up in years, to have such a girl with her as a permanent young companion and friend. After the cheese-making there remained the house-keeping, which Pleasance could share, and of which she was as ignorant as she had been of the secrets of the dairy, and Mrs. Balls recalled to mind an ancient course

of dressmaking which she herself had gone through in her youth, and which she proposed imparting to Pleasance, that she might be more thoroughly furnished in the character of country woman that her mother had filled. In the meantime Pleasance's little bit of money might lie like a nest-egg, and gather for her.

Pleasance was willing to learn anything and everything. She had wonderfully few qualms, and those she succeeded in swallowing silently in her steadfastness and craving after reality and thoroughness; she even desired something that Mrs. Balls opposed for a long time after she had given in to everything else, that she, Pleasance, should go out in the spring with the village girls, who, besides being dairy-women, were field-workers among the turnip, bean, hay, and occasional wheat fields of the farm.

Pleasance had made her choice, and she meant to abide by it, not looking back and not being weak enough to accept a compromise. No doubt she was helped in the persistence, singular in so young a girl, with which she held to her purpose, by the sense of the catastrophe in which her former life had ended. The tragedy of Anne's death turned her with something of an ineffable shock, from all her earlier experience with the regrets it involved, and set her face like iron against it.

There were only one or two instances in which Pleasance broke down in her resolve, and departed from the line which she had drawn for herself.

So long as the extreme bustle and fatigue of the cheese-making lasted, she had been able to live without recurring to her old beloved comrades of books, which, with the exception of Anne's Bible and Prayer-Book that Pleasance had taken for her own, she had put away. "A working girl has nothing to do with other books," Pleasance had said to herself with an austere narrowness which she would have condemned in another.

But when the pressure of the summer's work was over, and Pleasance, though she still had work that she set herself to fulfil, had also half hours and whole hours of leisure, and this at the time when her mind began to regain its elasticity and recover its interests, the craving for the old indulgence, the natural resource of every sympathetic and imaginative intellect, which has received any cultivation, grew to be so painful and irresistible with Pleasance, reduced as she was to the sole companionship of Mrs. Balls,

that the girl yielded on this point. She could not continue to keep herself from books, or debar herself from ever looking into them, even though she was not without a conviction that by doing so she was widening still further the breach which she was aware existed between herself and the village girls, and even between herself and her kinswoman, Mrs. Balls.

Pleasant's books consisted chiefly of a school Shakespeare, people's volumes of Sir Walter Scott, the earlier poems of Tennyson, with those school courses of literature which contain a little of everything, both in poetry and prose, from Chaucer and Bacon to Hood and Dickens.

Pleasant had gone a little way in French, Italian, and German during her school-days, and had a Racine, a Tasso, and a Schiller, with the dictionaries of their respective languages; but she was not so intellectually besotted as to think of having recourse to them in her low estate.

When she read in those later times she confined herself to English, and that reading was not all loss, when she was taught by Shakespeare, in many an illustration of his own words, that "sweet are the uses of adversity," and when she found under Sir Walter Scott's pen numberless pictures of the worth and charm of human life, in all circumstances and under every sky.

Pleasant, labouring under an obligation of social politeness, would offer to read aloud her dozen or score of pages to Mrs. Balls, and Mrs. Balls was pleased because it "pleased the gal;" but there the profit ended, for, except in listening to those words in the Bible and Prayer-Book with which she was familiar, Mrs. Balls could not follow reading aloud, and in her private mind held it to be a luxury fit only for gentlefolks.

If Pleasant read, she never wrote, for she had nobody to write to. She had a notion that it would no longer be suitable for her to maintain a connection, even if she had possessed time and inclination, with her former teachers and schoolfellows.

But with the loss of Pleasant's unconscious source of self-expression and imitative creation, she fell back curiously on another capability of which she had formerly made but little.

Pleasant had been learning to draw, but had been regarded as making very little of the art, and had never been able to compass such neat, clean copies of her governess' drawings as Anne had accumulated.

But now with the stump of a drawing-

pencil, replaced when it was exhausted by a penny pencil from Mrs. Grayling's store, Pleasant fell, at odd moments, into outlining the windmills, the barges, the Spanish chestnuts and walnut-trees at the foot of the garden, the old-fashioned flowers, and, above all, the denizens of the farmyard, all that, in other days, she would have copied in descriptive sketches in pen and ink, in letters for her father or to girls at home, during the holidays.

Very rough and barbarously primitive were these drawings, yet they were unmistakably life-studies with life in them, which Mrs. Balls could appreciate better than the life in printed pages.

"Why, Pleasant, I'm stammed, you 'a took Jenny and the new cow and the turkey cock on them torn mossels of paper as there be no mistakin' on them, as the photographer from Cheam couldn't 'a done it better. Couldn't you take me now?"

Pleasant tried, but Mrs. Balls's likeness was a great failure, and she was so much mortified at the way in which her Sunday bonnet, which she had put on for the purpose of the sitting, came out in Pleasant's strokes that she never requested the artist to renew the attempt. She left Pleasant to her reproduction of windmills and barges, beasts and birds.

With the beasts and birds, indeed, Pleasant had that peculiar acquaintance and friendship which is said to be the portion of all great animal-painters. Pleasant would never be a painter of any kind, but by dint of love and something of the artist in her she was able to supply the distinguishing attributes of the animals that were the great consolation and among the chief companions of her life.

Pleasant had come to know and to be on more or less affectionate terms with every horse and cow, every cock and hen, in the pastures and about the farm-doors, even as she had been intimate with the house-dog and caged birds at the Hayes. She had just such an outlying acquaintance with the haunts and habits of the plovers and snipes which belonged to the nearest broods as she had yearned to acquire with the squirrels and the hedgehogs in the Covey woods. This gain was something to Pleasant; it would have gone some way to reconcile her to a life among wild Indians or Esquimaux, if she could have extended her visiting list to monkeys and moose-deer, even to jackals and bears.

Mrs. Balls fixed some of Pleasant's little drawings with pins—from which they were

always dropping—among the herbs above the kitchen chimney-piece, and showed them off to Mrs. Morse or Mrs. Blennerhasset, who sniffed at them, and told each other Mrs. Balls was a fool about that “gal.”

Notwithstanding Mrs. Balls showed the drawings also to her parson and her landlord.

The vicar put on his spectacles to look at them. “Very pretty,” he said, which was exactly what the wild drawings were not; “but don’t you think, Mrs. Balls, drawing is an inconsistent employment for your young niece—hem—cousin, who has made up her mind to stay with you? If she had consented to come up to the vicarage to see Mrs. Fennel, or even to go into my wife’s class in the Sunday-school—Mrs. Fennel has bigger girls—we might have found out any talents and little accomplishments she had, and seen if anything could have been made of them; but as it is, don’t you think she can’t afford such a pursuit?”

The vicar had felt slightly aggrieved by Pleasance’s absolutely declining to establish any connection with the vicarage, or any house of the same rank in the parish. He suspected, not being an imaginative man, that the girl had inherited low tastes from her mother. He thought it would be better in the end to let her fall back without opposition into the station from which her mother had been taken. At the same time he feared naturally that which Pleasance was shunning for herself—the admixture of habits and views, the halting between two lives as between two opinions, which would certainly prove ruinous to the girl.

Lawyer Lockwood did not even put on his spectacles. He thrust his hands in his pockets and said, “I am glad you have got a companion, dame, but I think it is a pity for both of you that she is a bit genteel and school-girlish. You are a sensible woman,

and if you really mind her good you will keep her at the cheese-making, or at least at shirt-making, and not encourage her to scratch with a pencil in a way that any boy at a charity-school could far outdo.”

“She hev a little bit of money of her own,” said Mrs. Balls, with some spirit, for Pleasance.

“How does that come?” asked the inquisitive lawyer.

“Oh, it were her father’s, and is in the hands of his people.”

“Then I guess she won’t come into it till she be of age, which is a good bit ahead yet; and in the meantime I would not bring her up to be a fool, if I were you, Mrs. Balls.”

“The gentlemen are quite right, Mrs. Balls,” said Pleasance, with a mixture of pride and vexation, when she heard the report. “Please don’t show anybody any more of these wretched scratches. I wish I could keep from doing them, but I shall burn them after this.”

“That you shan’t,” said Mrs. Balls, “I d’ believe it is en-vy, and nought elsen, in passon and Lawyer Lockwood, because their own wife and daughters can’t do the like.”

“Nonsense, Mrs. Balls. I dare say Mrs. Fennel and the Miss Lockwoods can paint in water-colours and in sepia, as Miss Eckhard could paint at Miss Cayley’s.”

“I ’a a right to my fancy as well as any passon or Lawyer Lockwood on them, and my fancy is bits of pictures of the beasteses, and I shall ’a them stuck all over the walls, and not above the chimley-piece alone, if I like.”

“Then they will be falling down and catching fire, and getting the house burned,” said Pleasance. “You don’t want to have a kitchen like the Vicar of Wakefield’s?”

“Who be the Wicar of Wakefield? He don’t take arter our wicar, that’s plain.”

WALKING TOGETHER.

BY THE LATE BISHOP THIRLWALL, D.D.

“Can two walk together, except they be agreed.”—Amos iii. 3.

THIS is one of a series of examples, in the form of questions, all designed to illustrate the same fundamental truth, and to press it on the attention of a thoughtless people, who, lapt in ease and sinful pleasure, disregarded the warnings of the prophet, and the signs in the times, and would see no meaning in passing events which they would

allow for a moment to rouse them from their sensual dream of false security. That fundamental truth, which they overlooked and virtually denied, was no other than the subjection of the world to the providential rule of a Moral Governor: the truth that nothing happens in the world without a cause, which has its ultimate origin in the divine will:

that, consequently, every event, however seemingly trifling, has its significance, though one which may not be in all cases discernible to the eye of man. "Is it for nothing," argues the prophet, "that the roar of the lion is heard in the forest?" Is there no cause of alarm when the trumpet is blown in the city? Are not these commonly reckoned sure signs of the presence of a real danger? And when God's judgments are abroad in the world, and are expounded by his servants the prophets, according to his Holy Word, shall that warning be treated as an empty sound? 'Shall there be evil in a city, and the Lord hath not done it?' Ought it not, therefore, to lead all who do not deny the Divine sovereignty to consider their ways, and see whether, according to the eternal order of the Divine counsels, that which they are following is one which tends to good or to evil? If those careless ones who were at ease in Sion, and believed themselves secure in the mountain of Samaria, had been awakened by the blast which the prophets sounded in their ears, to a right sense of the character of their dealings, they would have been in no doubt as to the nature of the inevitable issue.

In the verse immediately before our text, Amos assigns a special and a very impressive reason which should have convinced them that they could not, without mad presumption, look forward to the continuance of that prosperity which they were so grossly abusing. "You only," he says in the name of the Lord to the children of Israel—"you only have I known of all the families of the earth; therefore I will punish you for all your iniquities." That is as much as to say, 'You did I single out from among all nations as the special objects of my fatherly tenderness: in your behalf I displayed the most signal proofs of my power: on you I bestowed the choicest gifts of my love: with you I entered into relations of such peculiar intimacy, that all the other children of men became comparatively strangers to me.' "You only have I known of all the families of the earth." But can you suppose that such privileges involve no corresponding obligations? Can you expect that you, who have met such undeserved blessings with such base ingratitude, shall be exempt from calamities which have befallen others, who, having been less highly favoured, could not sin so grievously? Have you not rather reason to be sure that, whoever else may be spared, your iniquities at least shall not pass unpunished? and that the very love of a

Holy Father will move Him to visit your offences according to the measure of your guilt?

The words of our text are in themselves so general that they might very well stand alone as a proverbial truth, capable of a vast variety of applications. They would furnish an ample theme for many important lessons of practical prudence. It must be understood that the "walking together" signifies co-operation, a *working* together for some common end. And then we see at once how impossible this is, without some previous agreement. To take the instance which the words most readily suggest, how could two travel together to any useful purpose without some mutual understanding as to the direction and object of the journey? And even this we know is often found insufficient, unless there be also such a harmony of character and disposition between them as will enable them to take pleasure in one another's society, and prevent them from "falling out by the way." And how unspeakably important is the application of the same truth to those who are about to enter on a companionship for the journey of life! What kind of a walking together would it be with them except they be agreed? Unless there be such accordance and sympathy, not only in superficial tastes and habits, but in heart and mind, in principles and convictions, what prospect can they have before them but one of growing estrangement and constant unhappiness? And there is another possible case which is indeed of not very unfrequent occurrence. The companions who set out in a spirit of hearty fellowship may, one or both, in the course of the journey, undergo a change which creates a separation between them; and then the alienation may be the deeper, and its effects the more disastrous, on account of the temporary union. Love may be not only quenched, but succeeded by hatred, warm friendship by bitter enmity.

It is recorded of Enoch and of Noah that each of them walked *with* God. With regard to other holy men, it is said of some, that they walked "*before* God"—as Abraham was charged to do by the Lord himself: "Walk before me, and be thou perfect"—of others, that they "walked *after* God." These various forms of expression may be considered as amounting to nearly the same thing, as denoting an extraordinary degree of piety and holiness in the persons so described. But still we may observe a distinction which it is important to note, in

the ideas suggested by the different expressions which so nearly coincide in their general significance. To "walk *before* God," according to the natural sense of the terms, would imply a living under an abiding consciousness of the Divine presence, as the governing motive of action. On the other hand, to walk *after* God, seems to signify nothing more than the simple acting of obedience to God's will, without reference to any motive, whether of fear or of love. But far more than this is indicated by the expression, "walking *with* God." It suggests a position of nearer access, in which the two are side by side: the privilege of a constant, free, familiar intercourse: a relation, not of fear or constraint, but of love and confidence; such as that of the child to the father, when it grasps his hand, rests upon his guidance, feels itself secure in his guardianship, and from time to time looks up into his face, to be cheered by the tenderness of his smile.

Here we may repeat the prophet's question, and in a case certainly not foreign to that which he had in his mind when he asked it: "Can two walk together except they be agreed?" He had been dwelling on the history of Israel's perverse ingratitude and abuse of the divine goodness. But there had been a time when, though apparently for a very brief period, it might be said that Israel had walked with God as "a dear son, a pleasant child;" when the people answered together, and said, "All that the Lord hath spoken we will do." But these good resolutions speedily vanished, under the heat of temptation, as the morning cloud and the early dew. And though the original relation between the Lord and his people, so far as it had its ground in the divine nature, remained unchanged, the conduct of the people had deprived them of the benefits which should have flowed from that relation, and converted it into a source of bitterness. The agreement between the two parties had ceased: how could they any longer walk together? Filial love had been quenched: filial obedience succeeded by the casting off of all respect to parental authority. How was it possible that fatherly love should continue to manifest itself in the same way as before, by the outpouring of benefits, and not rather by the sharpness of deserved and necessary chastisement!

It may, however, seem as if the question in our text, applied to the case we have been now speaking of, would become nugatory or unmeaning, because such a walking together

is itself a spiritual art, not so much the result of a previous agreement as the very agreement itself. But still it may not be the less important to keep in mind the distinction between an inward union of heart and will and the outward signs by which the union may be shown forth, because it is possible that the signs may continue after that which they signify has ceased to exist. Israel was distinguished and separated from the surrounding nations chiefly by the visible forms of worship. Its worship differed from that of the heathen in two respects, in its object and in its rites. While the worshippers of Baal, Moloch, and Ash-taroath bowed down to images which represented no worthier object of adoration than the senseless powers of nature, Israel's worship was paid to the Creator of heaven and earth. While the heathen idolatry was an occasion for the wildest excesses of lust and cruelty, and the groves and high places were schools of licentiousness and depravity, the Holy One of Israel was adored on Mount Zion, with a ceremonial splendid indeed and majestic, but grave and austere; tending in all its observances to keep alive the consciousness and the dread of sin, and so, even when silent, to inculcate the law of righteousness. And thus the Israelite who forsook the ordinances of the Lord's house for the orgies of the heathen, not only withheld from God the honour due unto his name, but declared his purpose of plunging into the lowest depths of sin and wickedness. It was therefore unavoidable that attendance on the services of the sanctuary should be commonly regarded as the chief test of faithfulness to God, and that a right worship should be identified with a true obedience. And so long as Israel was considered as one body, the church of the Living God, such language might be used without danger of any mischievous confusion. The promise, "I will walk among you, and will be your God, and ye shall be my people"—this promise might be fulfilled as to the whole, though it did not take effect in every part.

As to individual members of the Church, the case was far otherwise. Their walking with God in the ordinances of his house could be no proof of their *agreement* with Him. The difference between the form and the substance, and the utter worthlessness, the worse than worthlessness, of the form when separated from the substance, was never overlooked, and it was one of the themes on which the prophets dwelt most

frequently in strains of the most solemn warning. And we see that if the agreement did not previously exist, the most exact observance of the legal ceremonies, not only was quite powerless to produce it, but had the effect of widening the breach. When the Lord, by the word of Isaiah, remonstrates with his rebellious people, it is not because they had come short of that which they owed to him in the multitude of their sacrifices and oblations, or that they had neglected the keeping of the new moons and Sabbaths, the calling of assemblies or the solemn meeting. It would rather appear that never at any former period had all such duties been more scrupulously performed. But they were so far from conciliating His favour, that they were themselves an abomination unto Him, things which His soul hated; not of course on their own account, for they were things which He had himself appointed, but as viewed with respect to the persons of the worshippers. Then how stands the case with regard to our Christian worship? In the first place, it is clear that we have ample warrant for claiming, on behalf of the Church of Christ, all the promises which were made to Israel of old with regard to the Lord's walking among them or with them, more especially in their worshipping assemblies. The Church has a special and sure pledge of the Divine presence, wherever two or three are gathered together in the name of Christ. And it is secured to her, not merely by the letter of her Lord's declaration, but by the nature of things. In one of our Collects we say, "Almighty and most merciful God, of whose only gift it cometh that thy faithful people do unto thee true and laudable service." What gift is this? Speaking generally, and summing up the whole in one word, we must say that it is the gift of Jesus Christ, from or through whom all other gifts flow to us. But if we enter into the particulars of the service which God's faithful people—that is, the Church of Christ—are enabled to do unto Him, we find that the gift consists of two distinct parts. There is first of all the capacity of doing any true and laudable, that is, acceptable, service to God. Such capacity the Church owes entirely to the mediation of Christ, through whom alone we have access unto the Father. It is as the body of Him in whom the Father is well pleased, and in whom "it pleased the Father that all fulness should dwell," that the Church herself becomes the object of God's fatherly complacency. That which

He sees in her is the image of the Son of His love, and the work of the Spirit of His grace. And this is an object on which His eye must rest with tenderness and delight.

And it is not in this respect only that the Church may say, "All things come of thee, and of thine own have we given thee." It is not only of God's gift that we are able or warranted to do unto Him any service which He can accept, but the service itself, in all its most essential features and in its main parts, is His appointment. And it is distinguished from that of the old dispensation as a purely spiritual service; not standing in carnal ordinances, and therefore more agreeable to the nature of Him who seeks to be worshipt in spirit and in truth. So in both respects, in the greater boldness of access, and in the fuller assurance of an acceptable service, the Church of Christ can appropriate to herself, in a higher sense and with a firmer confidence, all the privileges of the ancient sanctuary. Hers is "the true tabernacle which the Lord pitched, and not man," and in it she celebrates a right and holy worship, not of man's device, but of God's providing. Here is the closest walking together, and it is the result of a perfect mutual agreement between the parties. But true as this is of the Church viewed in the light of the divine institution, it may be very far from the truth with regard to individual Christians, and all the farther in proportion to the superiority of the Christian over the Jewish worship. Even in this the question was asked, "Who shall ascend into the hill of the Lord? or who shall stand in his holy place?" And it was felt that clean hands and a pure heart were necessary conditions of a lawful approach and a rightful standing. Without these the sanctity of the service was not a sufficient plea for any Israelite to take part in it, but, on the contrary, aggravated the offence of his intrusion, and exposed him to the rebuke, "When ye come to appear before me, who hath required this at your hand, to tread my courts?"

But, my brethren, can it be that a less earnest and searching self-examination, or a less careful preparation of hands and heart is requisite to entitle any one to a share in the privileges of the Christian sanctuary? Must not the case be just the reverse? And if there is any contradiction or incongruity between the nature of the worship and the character of the worshipper, must not the contrast be the more glaring and offensive in proportion to the greater purity and spirituality of the Christian worship? And yet

how little do Christian minds appear to be occupied with the question, "Who shall ascend into the hill of the Lord, or who shall stand in his holy place?" in its application to the Church of Christ! In the early times this was the great practical question, in which all members of the Church felt the deepest interest. The approach to her public assemblies was guarded with the strictest caution. Entrance was permitted only after a severe probation, and those who were admitted had different places assigned to them according to the various measures of their capacity to partake of the sacred mysteries. This austere discipline has long passed away, leaving hardly a trace behind. There never, indeed, was a time when the order and ceremonial of public worship engaged a larger share of attention, or agitated the Church with more violent controversies. What is to be done in the holy place? what forms are to be observed by those who come together there? is treated as the question of supreme importance, on which the benefit of their coming mainly depends. It is forgotten that there is a previous question, which far more nearly concerns every one present; and that is, what right he has to be there? what is his standing-place in the sight of God? whether this walking together with God in the ordinances of his house is the effect of a real agreement of mind and will? whether he is indeed one of those who come together in the name of Christ as a bond of real unity, or he can use it only as a phrase to round his prayers?

The idea of true worship will be realised only in a higher sphere, where spirit blends with spirit, heart beats in unison with heart, all in perfect harmony with the pulsations of Divine Love. In that worship there is no performance of a task, no teaching of a lesson, no prayer, except as the natural confession of creaturely and childlike dependence. It goes up as the incense, which, when kindled, cannot but rise heavenward. In the worship of the Church below there is, and always must be, an admixture of elements foreign to its real nature, but needed for the supply of our temporary wants. Still this worship may and should be, whatever it may be beside, the highest expression, the culmination and efflorescence of the Christian life. If the flower, which witnesses to the healthy life and

growth of the plant, is severed from its stalk, it soon fades and withers, loses its colours and its fragrance, and is only fit to be swept away as worthless refuse. So it is with our worship; though its words should be suited to the lips of seraphs, and its forms worthy of the courts of heaven, if it is to us a mere outward thing, having no root or ground in our inner life. As long as this is the case, however in itself it may breathe the purest spirit of the gospel, it will be to us no more than a legal, carnal ordinance, a burden which we support under a sense of duty, and because to cast it off would seem to be a renouncing of our allegiance to God, but which yields us little either of joy or profit. That sense of duty is, indeed, a very precious thing, and it will not be in vain that we submit to its guidance. But as long as this is the highest motive that leads us to the house of God, whatever may be our outward position in it, our spiritual standing place will be in the lowest room, at the threshold, and scarcely within the porch of the sanctuary. And this attitude of our souls in the places and seasons at which God vouchsafes his special presence is not merely a symptom of something very much amiss in the habitual condition of our lives, but must be continually aggravating the evil of that condition. It not only indicates the distance which separates us from the Father of our spirits, but must be ever widening that distance. We have to ask ourselves not only, "Can two walk together, except they be agreed?" but also, "Can two be agreed, except they walk together?" Can our hearts be right with God if it makes no response, or only that of a reluctant, servile obedience to the call, "Seek ye my face?" "Seek ye my face." But when, and where? At all times and at all places. But above all where you may gaze upon it, though it be for a short interval, in perfect peace, while the din and turmoil of the world has been hushed to rest; where there is nothing to distract your thoughts from the contemplation of that Fatherly love which, having provided the means of access with boldness, even into the holiest through Christ, is ever inviting us to draw near in full assurance of faith, that we may taste the sweetness of a true fellowship with the Father and the Son, and to every fresh call may answer more and more gladly, "Thy face, Lord, will we seek."

A LAYMAN'S PLEA FOR MISSIONS.

Being an Address delivered in St. Mary's Church, St. Andrews, on the 30th November, the day of Intercession for Missions.

I HAVE been asked by those who have a right to do so, to speak to you to-day of the object for which we are met; and though naturally shrinking from it, I felt that I ought not to refuse.

Most persons here may be aware that for several years past a day for united special prayer for missions has been observed in England, and throughout the colonies of the British empire, at this season of the year. And both in England, and wherever the English language is spoken, the observance is more and more taking root, and felt to be a reality. Gradually the attraction is spreading to Scotland, and this year I am glad to think that in Edinburgh at least, the several Presbyterian Churches, which so seldom unite for any purpose, are to-day meeting for united prayer that the kingdom of God may be deepened and extended throughout the world.

In this small nook or creek it is all too easy for us to live on, quite unconscious of whither the great currents are setting in the world's wide ocean. This may happen to us in things secular, it may also in things religious. Therefore it is a thing to be glad for that by our meeting here to-day we are called aside for one hour, not only from our local interests and common routines, but also from the narrowing divisions of our particular Churches, to realise for once our common fellowship with all Christendom—that is, with the whole company of faithful people throughout the earth—that we have the opportunity of uniting in spirit with them to give our interest, our sympathy, and our prayers to that one object for which alone all Churches exist—the extension of Christ's kingdom throughout the world.

It may almost be said that it is only within the present century that the Churches have, for the first time since the Reformation, woke up to the obligation which is laid on them to fulfil their Lord's command, 'Go ye and make disciples of all nations.' But if the sense of this obligation awoke at the beginning of this century, the last thirty years have wonderfully quickened and enlarged it.

To this many causes have conspired. One of the most obvious is the sudden and unparalleled increase in rapidity of communication which this generation has seen. Distance has all but disappeared.

The ends of the earth are brought close together, and the thoughts that stir one nation soon become the property of all.

Something like this facility of intercourse, though on a smaller scale, was the prelude and preparation for the first spread of Christianity. Just before our Lord was born, the fleets of the Romans had cleared the seas of pirates, and made the Mediterranean the highway of the nations, and 'their stern legionaries, the massive iron hammers of the whole earth,' had beat down all natural barriers, and paved their long unflinching roads to the limits of the then known world.

This was part of that fulness of time for which the coming of the Messiah waited. Without such a physical preparation could St. Paul ever have passed from nation to nation with that fiery speed? 'Can we conceive the tidings of Christ's Gospel having spread round all the shores of the Mediterranean as they did?

The levelling of physical barriers has generally been the precursor of great moral and spiritual changes. And therefore those who take a serious view of matters, and believe that God has some great purpose for the world, which is worthy of Himself, cannot but look with earnest longing toward the spiritual issues which they believe the great material changes of this day are preparing.

When they ask what that purpose may be, they cannot believe that it is merely to produce a cheap cosmopolitanism, which, under all its polished surface, often hides less moral worth than the stiffest nationalism.

Neither can they see that purpose in the mere increase of trade. Increase of trade is good in its way, and no doubt is part of God's providence; but it is as a means that it is good, not as an end—a means to something beyond, and higher than, itself.

Neither can they see this purpose satisfied in the spread of that vague thing called civilisation. For civilisation at its best effects 'no deep and essential change in the heart of man.' As Vinet said, 'It encloses the passions of the heart in a net, it does not kill them. It covers the savage, it does not do away with him.' After civilisation has done its utmost, the savage or the natural man is still there, ready to break out whenever the occasion offers. Those who know and feel that there is in individual man and

in society a deep taint ineradicable by any mere human effort, by any disposition of material things, look for the fundamental remedy, not to increased trade, nor to cosmopolitan manners, nor to civilisation, not to intellectual enlightenment, nor to so-called education. They believe that one thing only has 'the gift of staunching and healing the deep wound of human nature,' and to it they look as the supreme purpose of God, as the hope of the world.

Do we doubt whether the realisation of Christ's kingdom on earth can really be the ultimate purpose of God, because the progress of it is so slow; because, after eighteen centuries of Christianity, more than half the human race are still without its pale? Or is our zeal damped by what we think the scanty and uncertain fruits that have been gathered by the labours of the most earnest missionaries of our own time? Of actual results I shall have a word to say presently. But first consider this.

If there is any one truth which modern science and history combine to teach, it is this—How slowly and deliberately the eternal purposes are evolved in time. Shall a million of years be allowed to the deposition of a layer of old red sandstone? And shall a few thousand years seem too long for the kingdom of Christ to take ere it leaven the world?

Or, again, to turn to the most certain facts of Sacred History. When that word came to the first Father of the Church, 'In thee shall all families of the earth be blessed,' or when at a later day Isaiah proclaimed to Judah, broken and defeated, 'Israel shall blossom and bud, and shall fill the face of the earth with fruit,' could anything in the world have appeared more improbable at that time than that these prophecies should ever be fulfilled? And yet does not history bear witness to their fulfilment? Do we not see their fulfilment realised before our eyes? Even if the world were to end to-night, would it not be true that Israel *has* blossomed and filled the face of the earth with fruit? Could it not be truly said that in Abraham—that is, in one sprung from him—all nations of the earth have been blessed, in a way, and to an extent, in which they have not been blessed by any mere man, or by all other human agencies combined?

And when He in whom these prophecies centred had come and uttered that word, 'Fear not, little flock, for it is your Father's good pleasure to give you the kingdom,' could anything at the time have appeared

more humanly hopeless than that this prophecy should ever be realised? A thoughtful writer of our time has lately said, 'I never hear without the thrill of a new surprise that calm, strange, unique prophecy, addressed at the very outset of His short career to a dozen peasants.' Who ever before, or since, has heard of one essaying 'with so slender an outfit so vast an enterprise?' A few Galilean peasants, poor, simple, ignorant—these were the instruments He chose to overcome the prejudice of the Jews, the wisdom of Greece, the imperial power of Rome. With calm assured presage He looked forward with those foolish things of the world to confound the wise, with those weak things of the world to bring to nought things that were.

And He has done it, He has subdued the foremost and most highly civilised nations of the earth; has won to Himself, not their outward life merely, but the inner citadel of their hearts. As has been said, 'He selected, with divine confidence of purpose, the least promising of all materials for the most majestic and enduring of all works, and He has proved their fitness by the history of the ages.' He who could promise with so assured conviction that which contradicted all human experience, must not the grounds of his knowledge have been rooted in the eternal foundations of things?

He who with means seemingly so inadequate and unpromising calmly began to found a kingdom which was to embrace the whole earth, and outlast the world, must not he have been conscious that He possessed within Himself the power which could supplement the frail materials from behind, and fit them to effect His purpose? 'The materials of the building are not only intrinsically frail, but it is the Builder Himself who selects them because they are so, and because He knows that He can give them strength from that hidden life in God which He led before He came here, while He was here, and after He was seen here no more.'

In what has just been said, I have condensed, as nearly as possible in his own words, a line of thought which Mr. R. H. Hutton, in a very thoughtful paper, brought before the late Church Congress, and which I trust I may be allowed to bring before you now. It seemed to me at once so true and forcible, and also so appropriate to be a basis for our thoughts this afternoon, that I have ventured to make this use of it. He goes on to suppose that some of those worldly-wise men who in our own day are so clever at explaining away the divine facts of Christianity, had

been present in Judæa eighteen hundred years ago, and heard our Lord make those promises to His little band of followers. Cannot we easily imagine the incredulity and scorn with which they would have heard His words? Would they not, on their principles—the very principles of, as they seemed, common sense and sound criticism—which they apply now, have rejected our Lord's prophecies as not worthy of serious refutation? And yet the history of Christianity has so far fulfilled Christ's prediction, that we see the knowing critics would have been wrong in their contemptuous rejection of them. According to their principles, it would have been folly to expect what has actually happened. Are we, then, to trust the same principles when they are employed to discredit the present condition and the future hopes of Christianity? Rather, I think, there are good grounds for the belief that Christ's gospel has not yet done either *intensively* or *extensively* half the work which it is yet destined to do on the earth.

The words of Vinet are true, when he says, 'Christianity even at this day, which seems to us so advanced a one, is very probably far from having produced all its effects in the conscience and life of humanity—from having expressed its whole thought, and uttered its last word. In one sense it said its whole say at once; in another, it has still much to say, and the world will only end when Christianity shall have said all.'

There is not one of the principles of Christianity which has unfolded all that is in it; not one of the moral germs that it has sown in the world which has borne all its fruits. How many centuries had Christianity been in the world before it uprooted slavery; how many before it put an end to religious persecution, if it has yet put an end to it? In countries where Christianity has long been professed, how much remains to be done, before it shall have really leavened all even Christian societies—how many practical errors may Christians still be tolerating, to which Christ's gospel has yet to open their eyes? Just as individual Christians often feel that they are so far from what they *ought* to be, that they almost doubt if they are real Christians at all, so, as to the most Christian communities, it must be owned that the leaven has but half pervaded them, if it has so much as half.

These thoughts, drawn from history and experience, ought, I think, to encourage us if we are at any time inclined to despair of Christian missions. Is there anything half

so incredible in the expectation that the more than half the human family which is now heathen should one day receive Christ's gospel, as there was in the hope entertained by St. Paul, eighteen hundred years ago, that the nations of Europe would, before a thousand years were past, acknowledge Christ? I do not now speak of the mere extension of the ecclesiastical network over all Europe. To some this may appear but a questionable benefit. But I speak of the intrinsic essential leavening which we know it has effected throughout Europe—to the innumerable souls which it has penetrated to the core—the untold hearts it has purified and consoled, the many lives it has beautified and sanctified—lives which nothing else could have penetrated. If so much has been effected within the last eighteen centuries, what, with the rapid intercourse of our time, may not take place in the next few hundred years?

Now, as to the actual results of missions at the present day.

You will meet many persons who have been to India, and will tell you that 'missions are a failure, that the converts too often exist only in the imagination of the missionary, and that when they do exist, their conversion is but nominal.' That is the kind of talk one has often enough heard from knowing men of the world.

But then I have generally found that the persons who so speak had never really interested themselves in missions while they were in India, had taken no trouble to know the truth about them, but were content with a mere surface impression. Indeed they are generally persons not likely to take trouble about any object that implies putting themselves out of their own way for any unselfish object.

We see but as we feel. Such men feel little, and therefore see little, as regards missions. Therefore I do not put any store by what they say. On the other hand, it may be said that missionaries are interested witnesses, and that, without saying their reports are false, it is difficult to know how to estimate them. I therefore turn to a Blue-book presented to Parliament by the Duke of Argyll when Secretary of State for India, and ordered by the House of Commons to be printed. Here at least we shall find impartial evidence, and this is the testimony given to the steady growth of missionary work within the last twenty-five years:—

'In 1852, there were 459 missionaries in India, at 320 stations.

'In 1872 the number of missionaries were increased to 606, at 522 stations.'

Then, as to the number of actual converts, the same official document states—'Statistical returns show that a great increase has taken place in the number of converts during the last twenty years.

'In 1850 the entire number of Protestant native converts in India, Burmah, and Ceylon amounted to 128,000 native Christians of all ages. Of these, 22,400 were communicants.

'In 1872 the converts, old and young, numbered 318,363. The communicants were 78,494.

'Taking them together, the rural and aboriginal populations of India now contain among them a quarter of a million native Christian converts.'

We say, perhaps, what are a quarter of a million to the hundred and sixty millions who make up the population of India? If this thought is discouraging, let us think what were the hundred and twenty disciples who met in the upper room after our Lord's ascension, to the Christendom which now fills the world? As to the intrinsically moral and spiritual worth of this missionary work, the same official document thus gives the impression of the missionaries themselves:—

'The missionaries in India hold the opinion that the winning of these converts is but a small portion of the beneficial results which have sprung from their labours. 'No statistics can give a fair view of all that they have done. They consider that their distinctive teaching, now applied to the country for many years, has powerfully affected the entire population. The moral tone of their teaching has affected multitudes who do not follow them as converts. It has given to the people at large new ideas, not only on purely religious questions, but on the nature of evil, the obligations of law, the motives by which human conduct should be regulated. Insensibly, a higher standard of moral conduct is becoming familiar to the people, especially to the young, which has been set before them not merely by public teaching, but by millions of printed books and tracts scattered widely throughout the country.

'They consider that the influence of their religious teaching is assisted and increased by the example of the better portions of the English community, by the spread of English literature and education, and by the high standard, tone, and purpose of Indian legislation; and by the spirit of freedom, benevolence, and justice which pervades the English

rule. And they augur well of the future moral progress of the native population of India, from these signs of solid advance already exhibited on every hand, and gained within the brief period of two generations.

'This view is not taken by missionaries alone. It has been accepted by many distinguished residents in India and experienced officers of the Government.'

After thus giving the view taken by those favourable to missions, the Blue-book appends to it this cautious, yet decided official verdict:—

'Without pronouncing an opinion upon the matter, the Government of India cannot but acknowledge the great obligation under which it is laid by the benevolent exertions made by those six hundred missionaries whose blameless example and self-denying labours are infusing new vigour into the stereotyped life of the great populations placed under English rule, and are preparing them to be in every way better men and better citizens of the great empire in which they dwell.'

After such a testimony, coming from such a quarter, even the most cautious persons, those most afraid of being carried away by enthusiasm, may be in some measure reassured. They are warranted to feel that they may with safety commit themselves to this much, that in taking interest in the progress of Christian missions in India, they are not throwing away their sympathies, but lending them to a useful and good cause.

To answer further the oft-put question, 'Are missionaries to the heathen doing any real good?' I wish I had time to quote at length the witness borne by three men of the highest position and character in India. One sentence only from each must suffice.

Lord Lawrence, late Governor-General of India, in a letter to the *Times* in 1873, said,—

'Apart from the higher interests of religion, it is most important, in the interests of the empire, that there should be a special class of men of holy lives and disinterested labours, living among the people, and seeking at all times their best good. To increase this class, and also to add to the number of qualified teachers (taken from) among the natives themselves, is the object of the Day of Special Prayer, and in this object I heartily sympathize.'

Lord Napier and Ettrick (our own countryman), late Governor of Madras, said,—

'The progress of Christianity is slow, but it is undeniable. Every year sees the area and the number slightly increase. The

gospel is brought more and more to the doors of the poorest and most ignorant outcast people.'

Lastly, Sir Bartle Frere, late Governor of Bombay, says,—

'I speak simply as to matters of experience and observation, and not of opinion, just as a Roman prefect might have reported to Trajan or the Antonines; and I assure you that, whatever may be told you to the contrary, the teaching of Christianity among 160,000,000 of civilised, industrious Hindus and Mohammedans in India, is effecting changes, moral, social, and political, which for extent and rapidity of effect, are far more extraordinary than anything that you or your fathers have witnessed in modern Europe.'

These good moral results are the fruits of distinctively religious teaching and example.

Do any believe that the same results could be produced by the spread of English education and literature apart from Christianity? It has not been mere literature and intellectual culture that have produced the like results among ourselves. What reason is there then to expect that they will do so among the Hindus, who are naturally as religious-minded a race as we are? Nor does the experiment, as far as it has gone, warrant any such expectations. There are now considerable numbers of young Bengal who, having been educated in Government colleges, have cast off the native religion, and not received the Christian. And the picture drawn of such Bengalee young gentlemen by those who know them is by no means edifying. No doubt that is but a transition stage. But it is our duty to try that the transition stage of mere negation should be as brief as possible. For, by the very nature of man, science and literature, to be healthy, must repose on a basis of faith; or remain hopeless and heartless, if left without one.

While in the Indian Peninsula missionaries are confronted by a civilisation older than our own, and a philosophy almost too subtle for the European mind to grasp, in other regions they have to face the hardships, often the horrors of savage life.

To Africa the thoughts of all Englishmen have of late been especially turned by the publication of the last ~~journeys~~ of Livingstone, and by the labours of Moffat, his father-in-law, two worthy Scots. In the heart of Africa, which Livingstone's journeys have opened up, there are powerful counter-agencies at work—the slave-stealing trade, and

the Mohammedan proselytizing sword. And unless Christian enterprise speedily presses upon the footsteps of Livingstone, these adverse forces may soon have obliterated the effect of his life and his death for the ends of civilisation and Christianity.

The numberless island groups which stud the Pacific have long been as interesting to the friends of missions as they are attractive to the lover of adventure or to the naturalist.

In 1839, the interest of Europe was roused to these islands by the tidings of the death of the good missionary, John Williams, murdered amidst his self-devoted labours by the cannibals of the island of Erromanga, one of the New Hebrides. European curiosity, startled for a little, soon fell asleep. But the unwearied missionaries of six or seven different Churches still pressed on in different parts of the vast Polynesia. And within twenty years after the death of Williams, on the very island where he fell, the gospel was welcomed with gladness by the people who murdered him.

Once more: in September, 1871, the world, which had thought so little in the interval about the South Sea Islands, was again startled by the news of the death of Bishop Patteson, murdered by the savages of Nukapu, one of the Santa Cruz group. Many here have no doubt since read of that self-devoted life and death. They will remember the strange, mysterious beauty of that scene when the boat was pushed off from the coral reef with his dead body in it, rolled in a native mat, with a palm-leaf fastened over the breast.

To those who have not read that life, especially to the young, I would say, read it.

They will there see the faithful picture of one in whom were united the highest cultivation and refinement of modern manhood with the simplicity, the self-devotion, the holiness of the first ages of the Christian Church.

As one well entitled to speak has well said—

'In him were singularly combined the spirit of chivalry—the glorious ornament of a bygone time—the spirit of charity, rare in every age, and the spirit of reverence, which the favourite children of this generation appear to have combined to ban. The three highest titles that can be given to man are those of martyr, hero, saint. Which of the three is there that in substance might not be attached to the name of John Coleridge Patteson?'

But we must beware lest we 'let our words

and thoughts outrun our hearts.' One almost feels, in speaking of such men, who and what are we that we should take upon us even to praise them? Is there not presumption, almost unreality, in common men doing so? For probably many persons of mature years here will feel that, though they have always in a general way approved of Christian missions, and given to them the yearly conventional dole, they have never really taken interest in them, or helped them by active sympathy. For myself I must confess that in time past I have given time and thought to many objects far less worthy. Perhaps one might never have been awakened from this lukewarmness, had it not been my lot to have known at college, both in Scotland and in England, some men who have since become eminent missionaries. As young men these were among the purest, the noblest, the most unselfish spirits I have ever met. They gave up, for the advancement of Christ's kingdom, home, high prospects, all that the world most values, and went forth to lead a life of privation and to find an early grave.

A few such we may have known, but doubtless there are many more like them now in the mission field whose names we have never heard. Can we think of such men without some burning of heart, some sense of the contrast between their self-devotion, and our easy self-indulgent ways? If we can do nothing else, we may cheer them by our sympathy, we may help them by prayer, we may at least say to them,—

'Press on—and we who may not share
The toil and glory of the fight
At least will ask, in earnest prayer,
God's blessing on the right.'

In this place, where so large a part of the population are young persons, many of whom will soon be scattered to the ends of the earth, would it not be well that their hearts should be early prepared, when they leave home, to take interest in the Christian work that is being done in the lands to which they may go, and to sympathize with the good men who are doing it? For this is quite certain, that, go where they will, they will not find anything else more worthy of their sympathy.

If it should be that none here may themselves become missionaries, yet it is well that they should know that in foreign lands

they, by their lives, must either help or hinder the cause of Christianity. The late Bishop Cotton used to say that one of the greatest hindrances to the progress of the gospel in India was the unchristian lives of many so-called Christians there. The natives naturally turn away with aversion from a religion which they see belied by the lives of many who profess it.

Any here whose lives may hereafter be spent in India, or other foreign lands, either in trade, or in the civil service, or as colonists, should know that the tone of their lives, whether they will it or no, must either help forward or retard the kingdom of God in the land where they dwell. By their whole dealings and bearing toward the natives they must either be witnesses to them for Christ or against Him.

He who has any Christianity in his heart at all will be conscientious how he treats these natives. The more careful, the more degraded they may be.

'For whose loves the Lord aright,
No soul of man can worthless find,
All will be precious in his sight
Since Christ on all hath shined.'

Now, as to urging young men and others to give themselves to mission work, I have always felt that there was something strange in persons exhorting others to undertake hardships and dangers for the sake of the gospel, which they had not themselves undergone. At least I for one cannot do it. He only seems entitled to press others to engage in battle, who can say, 'Follow me.' But this one *may* say, That if any young man should feel his heart moved to go forth as a missionary, he would choose a course for which this world, indeed, has no rewards, except the honour and the sympathy of the best men.

But if he is a true missionary, he will find another reward—the sense that he is helping forward the true hope of the world in the directest way—the consciousness that he is permitted to be a fellow-worker with the Highest in advancing upon earth His eternal kingdom. And we, whose lot is now fixed at home, will follow such men with our sympathies and our prayers, and will feel that, if our lives and work here have any worth, it is only as they tend, either directly or indirectly, to set forward that same kingdom of God.

LITTLE MARY CRADOCK.

By LADY VERNEY.

I SAT waiting for a busy man, and as the old horse moved slowly backwards and forward for the benefit of his health in the north-east wind, sharp, though it pretended to be May, we came opposite a cheap draper's at the corner of a poor street. The windows were full of earnest adjurations to "purchase this splendid article, the only thing worn, price fivepence three farthings;" or "this entirely new and fashionable design in mantles, just out, at less than cost price." I wanted a ball of string, and utilised my enforced leisure by going in to get it. It is a tedious business to buy even a ball of string at a cheap draper's, and I had long to wait. Presently the shop door opened and two

little children came in hand-in-hand; their brown frocks were of the simplest possible stuff, but there was quite a poetry of neatness in the exquisite nicety of their dress, the little lines of white frill round their throats and sleeves, the string of coral round their necks. They had nothing on their heads, but their beautifully plaited hair hung down their backs. There was almost a foreign air about them, but their accent was purely English. Altogether they had a refined, cared-for look, contrasting with their premature shifting for themselves, which was very touching.

They were both very pretty children, with small regular features, but the anxious consi-

Page 139.

dering expression in the dark pale face of the eldest was much too old for her years. Her long eyelashes almost rested on her cheeks, and when she raised them, the large liquid brown eyes had a whole world of thought and feeling in them. She began in a low, gentle, shy voice, to set forth a long list of infinitesimal wants to the shopman. "Three small hooks and eyes, half-a-dozen pearl shirt-buttons, two large horn ones, a reel of black thread, a skein of worsted," and so on. She was very clear and precise in her enumeration, and evidently scrupulously exact, and while the shopman was very patiently looking out her requirements, she ranged three pennies and a halfpenny, kept tight and hot in her little hand, on the edge of the counter to pay for her large order. I spoke to her, and asked if they lived near. "Not far," she said in a reserved tone. How old were they?

"Annette is six, I am eight," she answered, but in the same cold, self-contained manner. They had evidently been told not to gossip with strangers.

"What little things to send on errands!" I said to the shopman.

"They do their work much better than the big ones," he replied. "We'd ten times rather have such than their mothers. They loiter and talk and look at a dozen things without buying; these do their business, and have done with it."

I had at last received my string, I could not infringe further on the quiet little dignity of my companions, and went away.

Not many days after I was waiting again in the same neighbourhood, but this time in one of the busiest of the busy London thoroughfares. It was in the height of the fearful rush of the season, and I sat watch-

ing the heavy omnibuses crowded with masses of human beings which came bearing down upon us. Great waggons crushed heavily on; dashing Hansom cabs swung recklessly past—cutting in—swinging—turning—crossing; horses were prancing and plunging; it was a network of legs and wheels; a perfect Babel of noise and bustle. As I looked on I noticed two little girls with a small boy about two years old between them, hurrying along the pavement. The nurses held tightly on to the child's hands, and his black beads of eyes peered out of his shelter with the wide-awake sharp expression of a London baby. Suddenly, to my distress, the convoy began to attempt to cross the street in the face of the hubbub, and I recognised the long tails (though the heads were now covered with hats) and the brown frocks of my small acquaintances of the week before. It was a raw, gusty, disagreeable day, the water-carts and the east wind were fighting against each other, and water and dust had been churned into a sort of greasy mud. The horses had a very infirm footing on the slippery steep incline of the wide street; there was no regular crossing, but the children were following the lead of some older adventurous passengers. I watched the perilous passage anxiously, too far off to be of any help; all seemed at first to go on well; even that incarnation of the London savage, a butcher's boy, had turned aside for them in his reckless course. They were so small and innocent-looking that the omnibuses swerved an inch or two in their favour, and the prancing horses in a barouche drew up a hair's breadth to let them pass. I began to breathe, they were already half way across in safety, when the little group was cut off from the rest of the company, and stopped in the very middle of road by an enormous dray with four horses, which was taking its slow length along. They stood beside it as behind a rampart of defence as long as its course lasted, but it had stopped the way for a whole entanglement of impatient cabs and carriages, and as the last heavy wheel rolled stolidly on, two violently driven Hansoms cut across each other, both trying to be first in the narrow free way which now opened for them. There was just time for the children to get past the rival horses' heads—not the twentieth of a second to spare, when to my horror I saw the little nurse child slip on the greasy pavement, there was a tumbling heap of little petticoats for a moment, and a frightful confusion of hoofs and wheels and children's

XVII—10

limbs. The horses had, almost miraculously as it seemed, avoided trampling on them, but the wheels had been less merciful, and by the time I reached the spot, the bystanders were raising a fainting child from the ground, with a poor little crushed bleeding foot and ankle which I could hardly bear to look at. Everybody was very helpful, some water was brought from a shop, smelling salts came out of somebody's pocket, sal volatile from the chemist's below; but there was nothing really to be done but to take her to the nearest hospital. A policeman came forward and took hold of the hands of the two younger children. "Where do you live?" he said in a very fatherly tone. "Mamy knows—we haven't been there long," replied little Annette, pointing to her sister and sobbing. "But at least you can show me the way to it," inquired the man kindly. She nodded and pointed down the street. "Robby and me can find it," she said, and they trotted off trustfully, one on each side their guardian, as we drove away.

"Where's Robby, he's not hurt, I hope?" asked the poor child, waking up from her swoon. "I *did* try to push him out of the way of the wheels, and Annette too. You'll tell mother," and she relapsed into a half-conscious state.

It was not very far to the hospital, but it seemed hours before she could be delivered over to the shrewd, quick-looking surgeon, and the pleasant-faced nurse. He shook his head.

"It's a case of amputation—chloroform: she won't feel it," pronounced he gravely and decidedly, and the poor little prostrate form was hurried off, the large eyes looking round with a puzzled, half-scared expression, which was infinitely pathetic, at my face, as the only one she had ever seen before.

"She'd better be kept as quiet as can be," said the nurse kindly, when I asked how soon her friends might see the little girl. "They'll do no good, and only worry her by crying, most likely."

I had no means of communicating with the child's home. She herself could not be troubled about it, and the policeman must be trusted to give the direction of the hospital, to which he knew she had been carried. "You'll get the address for me as soon as you can," I said, as I went away. It was now nearly dark.

The next morning when I went to inquire for Mary, "She's asleep," said the nurse, "she's going on all right, but it's a nervous little one, and best kept quiet. Chloroform's

all very well, but it's the healing, which must be gone through all the same, and the being sick after it's over, and the first dressing and all that is so trying, as we nurses know, none so well. You'd best not see her yet. Her father came late last night, and here's the address where they live, which he gave me—Jem Cradock's the name."

I went in search of the place. At the end of a quiet *cul-de-sac*, opening out of the great thoroughfare, were a pair of lofty iron gates belonging to the departed greatness of some old-fashioned "mansion"—*entre cour et jardin*. I passed in—a wild tangle of lilacs and pink May in full flower, great bunches of white elder, and broad-leaved sumach, with tall elms over-arching the whole, were growing about deep hollows, where the bricks had been dug out of the foundations of the deceased great house, and upon the desolate heaps of refuse overgrown with long grass. Only the gloomy backs of a few almost windowless houses looked into the space, which was very large, and everything was so still that the birds were singing as in a country lane; yet on all sides the roar of the great city seemed to hem it in, and was heard rising and falling occasionally, but with the continuous undertone of the sea—the silence seemed like a presence, by force of contrast. The garden had once run down to the edge of the river, but the new enclosed foreshore had isolated it from the world beyond, with a broad strip of frowsy, untidy, unoccupied land shut in by a high fence. Amongst the grass, surrounded by the flowering shrubs, overshadowed by the tall trees, was a large old boat, evidently dragged up and forgotten when the river wall had been first made, and now left stranded, far from the only element where it could be of "any use or significance" whatever—left behind in the race—empty, useless, "remote, unfriendly, melancholy, slow." It was very strongly built, and there was a good deal of work left in it, if it could have been in its right place, but now it lay blistered by the sun, its planks gradually rotting away—mouldering piecemeal, in unlovely decay. *King Theodore* was painted in rude red letters on the bows. Poor *King Theodore*! I felt quite sorry for him—one out of sorts with fortune, like his namesake,—"out of gear" in the world.

I made my way to the door of some old stables which had belonged to the ex-great house, and had not been pulled down. I was met by a groom coming from his horses.

"Jem Cradock—yes, that's me. You're

come to see my missis?" said he. "It's a poor place, will you walk up-stairs. She's just a-been brought to bed of her fourth, yesterday, and she's a-been rarely put about with all this, so to speak. She took on greatly about Mamy. I'd a hard matter for to pacify her last night, when I come home."

Then, as we went up the steep rickety staircase, he went on—

"I were out a'most all yesterday, and the nurse she just sent the children off to be out of the way for the day to their aunt's—that's my sister—and there wasn't anybody to see to them there, I take it—she's so busy, is my sister—and so they gets into trouble trying to come home, I suppose. Mamy's such a one to be with her mother."

It was a little dark room, looking out, not on the garden, but on a narrow yard beyond, which was very close even on this breezy day. The poor woman's pale face was so painfully eager and nervous, as made one's heart ache to see, at the time when she most required rest of mind and body, while a wailing baby lay on the bed beside her.

"Had I seen her child? was she in great pain? what did she say? She was a great help to her mother, was Mamy! Where's Mamy?" she sobbed pitifully. "Oh, Jem, why weren't you there, not to let her be sent off like that out of the house when I couldn't see to it!" and the big tears rolled down her white cheeks.

I saw where Mamy's large eyes and long lashes, and clear brunette complexion came from. She was from Jersey herself, she told me.

The two other children were playing in the room. "She couldn't bear them now out of her sight," said the loud-voiced drabby nurse, when I proposed to take them away for a time.

"You'll have her in a fever if you don't keep her quieter than this," I said to the husband, as I came away to get some more and better help.

Jem began explaining rather confusedly about his being away till so late the day before, his broad, good-natured, weak, handsome face, had a sort of blush up to his red ears. I am afraid it had been enjoying itself at the public house, instead of helping in the trouble at home. To conceal his shamefaced look he stooped down and took up a child on each strong arm, and little Robby crowed with delight, and patted daddy's face as he went along. He was evidently fond of his children, and kind to them after his fashion, and when he remembered it. He now carried them both out, and put them

into the old boat, the sides of which were too high for them to crawl out unassisted.

"There!" said he, with great satisfaction at his own invention, "they'll be safe here, anyhow for a while, out of harm's way, and I shan't be far off with the horses. Mother was Jersey born, and knowed as much about a boat when I married her as I does of a horse, so I think she'll be pleased like."

The two small young faces peered curiously and rather anxiously over the weather-beaten timbers as I handed up all the things to play with that we could lay hands on. I looked back as I left the place. The weather had recovered its temper. The shadows of the trees flickered over them, the soft May wind blew the petals of the laburnum in their faces. Robby had hooked himself on by his arms over the edge of the boat; Annette was resting her round cheek on her hand: they looked like the cherubs at the bottom of the San Sisto Raphael, without any inconvenient little stomachs to be filled, or active little limbs to be clothed, while the bright eyes watched me intently as I walked away, promising to return.

The poor woman's recovery was very slow. I thought she looked more white and more nervous than ever when next I brought her news of Mamy.

"She was such a one to help at home; she'd more thought in her little finger nor yonder woman in her big body," said she irritably, as the heavy-handed, heavy-footed char-woman clattered among the crockery, and disturbed the equilibrium of everything which could be shaken or overset. Poor Annette's fastidious neatness was cruelly insulted by the din and disorder of her drabby nurse, but this was to be remedied to-day, and more efficient help coming.

"And Jem says she's lost her foot;" she went on, "it's bad enough for a man, but for a little girl, and such a pretty one, and so light to go," she sobbed, "folk mayn't like to marry her with but one poor little foot, perhaps; and how's she to get her living with crutches like that? My little Mamy, ma petite, my darling, my pretty one!"

"She'll get about wonderfully, they say, with an artificial foot. You'll hardly see it, and she's so young she'll learn to manage it like a real one; and she's doing very nicely at the hospital, and they're all so fond of her in the ward, and petting and spoiling her to your heart's content. I wish you could see her; she looked quite happy to-day, and a little colour in her cheeks."

But Annette the elder refused to be comforted; she pined to get to see her child, or that she should come to her, and neither the one nor the other was possible.

Although the shock had been great to the nervous child, she was up and about before her mother. It was the first day that the poor woman had come down-stairs, and she insisted on sitting under the trees, with an empty chair beside her, watching anxiously for the sound of the wheels which were to bring her Mary home. Presently the great iron gates creaked majestically, and poor Mamy on her crutches came slowly in. Annette held out her arms: she was white even to her lips, and looked as if she were going to faint; but she recovered herself, and sat stroking her child's face, and crooning inarticulate welcomes, with a shower of pet names in her long-unused Jersey patois, which seemed to come more naturally to her in moments of emotion. "Mon chou! mon ange! mon petit cœur! my precious!" And then the two sat side by side in silence, holding each other by the hand.

"Was it very bad, Mamy?" said her mother at last. "And your poor foot gone and all!" And her tears began to flow.

"They were all so kind," answered the little girl cheerfully, "and nurse had a canary sung so nice; and Mrs. Jones gave me, oh! such a pretty picture-book (it's in my box), and a doll with real petticoats to take off. They were all quite sorry when I came away."

"And you can't get about without your crutches," sighed her mother, not listening to the list of delights, and even, I thought, a little jealous of the new friends whom her child had made and she knew nothing of.

"I'm to be measured for my foot in next week," answered Mamy proudly; "and I shall walk now soon so nice with the crutches. There was a little boy, younger nor me, used to hop about so funny with them. He'd get across the ward so as they could hardly catch him; and I can do a great deal too: only see!"

And she began to show off her proficiency, her mother uttering a faint cry at the sight, doleful enough, of the efforts to make the best of the great loss. The wind had been tempered to the shorn lamb, but the poor mother's tears were hardly to be wondered at.

I thought I detected a strong effort in the child to bring forward all the cheerful side of the story, almost unconsciously springing out of her old life of ardent devotion to her mother; but the struggle was growing almost

too much for her, as I saw in her little quivering lips and drooping head.

"Here's some bread and butter, and tea and cake—we're making a feast for Mamy's coming home so well," made a wholesome diversion.

"And you haven't seen the baby," said the new nurse, judiciously bringing forward the very ugly little red bundle which few but mothers can admire.

And presently, to his little daughter's joy, Jem rode in at the gates, on one horse and leading another, with a grin and a smile of welcome, and, coming out from the stables, seized hold of the younger children, who had been kept till now in the back-ground, and hoisted them both into the old

boat, where they sat looking down on us as out of a big cradle, munching cake and drinking mugs of tea, in a serious, earnest state of mind, as if they were performing a grave and solemn duty to themselves and the public.

Even poor *King Theodore* had found a certain use by waiting patiently for his time.

The cloud had lifted from poor Annette Cradock's face, as Mamy crept very close to her in the little low arm-chair, her small arms and soft cheek resting on her mother's hands and lap, with a sort of protecting comfort and care in them, which was inexpressibly touching from the child to the parent. The sun shone, both morally and materially, on the little group, for that evening at least, and I came away.

BEFORE THE FIGHT.

"WHO is there, Fritz, to pray for you?"

I said, as we were lying
On the bare ground beneath the firs,
Through which the wind went sighing.

The leaguered city lay below,
Our men lay round about us,
And I had thought of home, and how
The evenings passed without us.

Fritz rose and leaned against a tree,
And on the mist stood gazing—
"There's nobody to pray for me,
For all my folk are praising.

"Or as yours pray for you at home,
In heaven mine may be praying.
'Lord, do not let him longer roam,
Love sickens with delaying.'

"Prayers change, you see," and Fritz smiled
sweet
Out in the pale moon's shiver,
"Yet in God's heart the prayers all meet,
And melt in his love's river."

Next eve the sun went angry down,
Next night was dark and chill,
And I lay in the conquered town,
But Fritz slept on the hill.

ISABELLA FVIE MAYO.

HOMES OF THE LONDON POOR.

CHARLES KINGSLEY, in one of his most touching essays, mourns over the malign influence exerted on the decent and industrious poor by their enforced proximity to the idle and degraded. "Let us no longer stand by," he urges, "and see moral purity, in street after street, pent in the same noisome den with moral corruption, to be involved in one common doom, as the Latin tyrant of old used to bind together the dead corpse and the living victim. But let the man who would deserve well of his city, well of his country, set his heart and brain to the great purpose of giving the workman a dwelling fit for a virtuous and a civilised being, and like the priest of old stand between the living and the dead, that the plague may be stayed." If it had been Charles Kingsley's

good fortune to have accompanied us in some of our recent visitations, he would probably have penned without delay a proof of the vast influence for good that may be exerted by the respectable and industrious poor on those around them and below them in the social scale, when once you have practically considered their case, and made it possible for them to live quiet and cleanly lives.

By appointment on a recent morning, we met a lady who had agreed to show us the mode in which she carried on an important department of the work, to which she has for years devoted all her time and energies. We passed through a fine, fashionable street, then through a square, crossed over a main street, and turned down an alley, at once to perceive that we were on the margin of a

crowded district. This alley burrowed along through rows of damp, dilapidated houses, with that peculiar close odour one never misses in such places, and at last we found ourselves in the centre of a court, which at first look struck us with a joyous sense of contrast. The space between the rows (for it is a thoroughfare) was comparatively clean, in spite of the numerous articles set out at the dingy shop-doors; and, looking through into the back yards, for most part miserably small, one was pleased to find them clear and very clean. Only in one case did we see some boxes set up against the wall; and for this, as our guide explained to us, a special license had been given, as the employment of the man to whom they belonged could not be carried on without his occasionally having them there for a little space. "We have to exercise a firm control in all these matters," said she, "for if you give an inch, an ell would soon be taken." We pass in, and go on from one room to another, admiring the whiteness of the common stairs, and the excellent condition of the houses. Here is a family of little ones left in charge of a father, convalescent, while the mother is out at work. A word of kindly encouragement is said, and a fresh engagement for next day is made for the wife. In another room two young girls are busy at the sewing-machine, the one teaching the other, while the mother is out; some cheerful words of counsel are given, and a magazine left in place of one sent back. In a room above, a man and his wife are enthusiastic over their singing-birds, and a few minutes is passed in listening to his account of his favourites. Next door a complaint is tendered about a neighbour who has been disagreeable, and a bit of skilful mediation has to be done between this tenant and the tenant of the room above: there a grate is out of gear; and here again a chimney-pot has been broken, with a smoky room for one result. These have to be arranged for, and a note is accordingly taken. In another house, we find in one room a cobbler working away industriously, and cheerful in spite of dull trade; and in the next room to him a mother is anxious to know about a place which is in view for her eldest girl. Some of the tenants are out, many of them being costermongers, who need assistance from their wives in their callings; but in most cases either the rent or a message has been left with a neighbour. So we go on, seeing in an hour or so some thirty tenants. The rent is taken

in most cases, or a day is fixed for its payment (for this is a collector's visit), but in each case such kindly inquiries are made, little familiar details are communicated, and the thoroughly confidential and friendly footing on which landlady and tenants stand is clearly apparent in the various remarks and requests of the latter. They know and, to a great extent, trust each other,—that is clear. The lady who has accompanied us has the charge of no fewer than fifteen such blocks as that we now stand in, and has altogether under her a population of 3,000. Of course, she began in a small way, and has added to her charge gradually; but in all of them she has managed to gain the goodwill and confidence of the people, and also to do a great deal towards solving one of the most pressing problems of the day in reference to the life of the poor in our great cities.

Any one who wishes to see in detail how she has been led on step by step in this great work, should consult her own simple but eloquent account of it.* We can hope to give but a bald exposition in the small space at our disposal.

Miss Hill had seen so much of the tyranny exercised over the poor by a low class of landlords—those tenants who paid rent suffering for those who did not pay, in the form of accumulated dirt, and buildings wholly out of repair—that she resolved to make an experiment, and see whether a better type of landlord could not gradually make better tenants. On hearing her scheme Mr. Ruskin advanced a certain sum of money for the purchase of suitable buildings. Three houses not far from her own home were bought—very dirty and dilapidated. They were put into thorough repair, and let to such tenants as offered, under a distinct understanding as to the rules to be observed. These were that the rent be regularly paid—a point which has been most stringently enforced—and that the place be kept in every respect clean and neat. From the first Miss Hill took care to keep up a strict personal supervision—she had her regular times of calling on the tenants, when she would point out anything amiss, or drop an encouraging word when the room was clean and tidy, and she would appear unexpectedly in order to see that the standard of cleanliness was kept up. Gradually, as the plan, in spite of difficulties, was found to have good results, other friends, besides Mr. Ruskin, came to her aid, and other

* "Homes of the London Poor." By Octavia Hill. Macmillan & Co.

houses, some in even lower quarters than the first lot, were bought, repaired, or rebuilt, and put under her rule, till now she has a staff of volunteer assistants who aid her in collecting and supervising her enlarging properties.

In the cases of the more extensive courts, the condition of affairs was truly pitiable prior to her management. Families lived in low dark cellars; there was no attention paid to drainage or to water supply, and, as may be imagined, the morals of the people were correspondent. Yet there were bright exceptions; and these formed the one hopeful element to begin with. In all cases where the freehold could be bought, or where the conditions of the lease would allow it, old structures, especially those built over what had originally been back yards, were removed to let in light and air; and it would hardly be believed that in some instances these back courts had been built in on till they did not extend to more than five feet either way; no provision otherwise being made for dust-bin, water, &c., and in some instances the accumulations of years had been gathered here, while poor creatures tenanted the cellars close to it. The blocks of new houses which have been built are admirably planned, and all has been done that could well be done, to secure free space behind. As for the old houses, the best is made of them that can be made, and Miss Hill consoles herself, in her own cheery practical way that, since they can't be got rid of, they are good schools for training the people for something better. And in this, from what we saw, she is clearly right. The irregular habits of the class are hard to eradicate—even systematic locking of the street-doors so as to save the passages from risk of destruction from intruders, is found to be difficult of attainment.

In the matter of moral influence, equal practical wisdom and care appear. It was a particular pleasure to us to see the large airy rooms devoted to men's club and reading room, and the meeting room for women and girls; and from what we saw we can believe that the Saturday evenings Saving's Collection is a sight to be remembered if once seen. All this, of course, could not have been began, not to speak of being carried on successfully as it has been, had not the firmness, so far as the business element is concerned, been combined with genuine consideration for all; and this, no doubt, it is chiefly which has enabled Miss Hill to do what she has done. It is the personal influence which she has made to inform all that gives the real clue to her success.

"My people," she says, "are all numbered; not merely counted, but known, man, woman, and child. I have seen their self-denying efforts to pay rent in time of trouble, or their reckless extravagance in seasons of abundance; their patient labour, or their failure to use the self-control necessary to the performance of the more remunerative kinds of work; their efforts to keep their children at school, or their selfish, lazy way of living on their children's earnings. . . . If positive gifts must be resorted to, who could give them with so little pain to the proud spirit, so little risk of undermining the feeble one, as the friend of old standing?—the friend, moreover, who has rigorously exacted the fulfilment of their duty in punctual payment of rent; towards whom, therefore, they might feel they had done what they could while strength lasted, and need not surely be ashamed to receive a little bread in time of want?"

It is worth noticing that a certain class of the repairs are reserved as a means of affording work to the tenants in slack times, and that the stairs and passages are scrubbed twice a week by the elder girls, who can not only in this way earn sixpence, but gain a facility and liking for work of the kind; and we are told that a healthy spirit of emulation has in many cases been excited by this arrangement. Looking at the wisdom and tact shown in the administration—the mingled firmness and kindness which characterizes the whole method, we are not surprised to find that the people have learned to trust Miss Hill thoroughly, and are keen to co-operate in many ways for their own further improvement. Yet it is surely very remarkable to find that, though she has in some instances failed to carry her tenants with her in her desire to elevate them, she is able to say, "In no single case have I met with suspicion or with anything but entire confidence." For this object much pains is taken to arrange so as to make them unconsciously co-operate in mutual improvement. "Our success depends," says Miss Hill, "on duly arranging the inmates: not too many children in any one house, so as to overcrowd it; not too few, so as to overcrowd another; not two bad people side by side, or they drink together; not a terribly bad person beside a very respectable one."

It has been one great aim of Miss Hill thus to develop in her people a sense of self-respect, especially in the matters of space and fit conveniences. Wherever a family can be induced to have two rooms instead of one, or wherever a solitary dweller could be urged to give up a poor room for a better one, she has been ready to aid and encourage; and very touching are some of her stories which illustrate her efforts in this way. She writes in one place:—

"Our plan of removing the inhabitants of the

miserable underground kitchens to rooms in the upper parts of the houses did not, strange as it may seem, meet with any approbation at first. They had been so long in the semi-darkness that they felt it an effort to move; one woman in particular, I remember, pleaded hard with me, to let her stop, saying, 'My bits of things won't look anything if you bring them to the light.' By degrees, however, we effected the change."

These underground kitchens are now either disused or devoted to holding the stocks of the inmates—an important matter, —for one of the great evils of courts inhabited by costermongers is their inveterate habit of having their stocks in their rooms.

Managed as Miss Hill manages her houses, the property becomes a medium for restoring and elevating to their former position those who by misfortune may have lapsed. Thus she tells of one case:—

"One great advantage arising from the management of the houses is, that they form a test place, in which people may prove themselves worthy of higher situations. Not a few of the tenants have been persons who have sank beneath the stratum where once they were known, and some of these, simply by proving their character, have been able to regain their former situations. One man, twenty years ago, had been a gentleman's servant, had saved money, gone into business, married, failed, and then found himself out of the groove of work. When I made his acquaintance, he was earning a miserable pittance for his wife and seven unhealthy children, and all the nine souls were suffering and sinking unknown. After watching and proving him for three years, I was able to recommend him to a gentleman in the country, where now the whole family are profiting by having six rooms instead of one, fresh air, and regular wages."

Of course, all this is accomplished as a merely secondary result, and it has been done without detriment to the commercial aspect of the experiment. Most readers will be glad to know that in this regard also, the thing has proved a decided success.

"The pecuniary result has been very satisfactory. Five per cent. interest has been paid on all the capital invested. A fund for the repayment of capital is accumulating. A liberal allowance has been made for repairs; and here I may speak of the means adopted for making the tenants careful about breakage and waste. The sum allowed yearly for repairs is fixed for each house, and if it has not all been spent on restoring and replacing, the surplus is used for providing such additional appliances as the tenants themselves desire. It is therefore to their interest to keep the expenditure for repairs as low as possible; and instead of committing the wanton damage common among tenants of their class, they are careful to avoid injury, and very helpful in finding economical methods of restoring what is broken or worn out, often doing little repairs of their own accord. From the proceeds of the rent, also, interest has been paid on the capital spent in building a large room where the tenants can assemble. Classes are held there—for boys, twice weekly; for girls, once: a singing class has just been established. A large

work class for married women and elder girls meets once a week. A glad sight it is—the large room filled with the eager, merry faces of the girls, from which those of the older, careworn women catch a reflected light. It is a good time for quiet talk with them as we work, and many a neighbourly feeling is called out among them as we sit together on the same bench, lend one another cotton or needles, are served by the same hand, and look to the same person for direction. The babies are a great bond of union. I have known the very women who not long before had been literally fighting, sit at the work class busily and earnestly comparing notes of their babies' respective history. That a consciousness of corporate life is developed in them is shown by the not infrequent use of the expression, 'One of us.'"

To demonstrate how such properties may be made to yield a fair return, as Miss Octavia Hill has indubitably done, is a matter of vast moment—it is indeed like the opening-up of a new world of hope and promise to those who have social improvement and amelioration at heart; for it is now a recognised axiom that you can only help the poor by teaching them that self-respect which leads to effective self-help. But there is a series of less apparent influences set in operation by this plan, which should not be lost sight of. Each of these courts is a centre of softening and civilising influences. The dwellers near by daily see what may be gained by conformity to rule, by unity, by temperance, by cleanliness. The self-interest rather than the self-denial of all these classes is what must be first appealed to with any hope of success; and very effectually must it be appealed to by the constant presence of a community of their own class, who have already lifted themselves a degree higher in the social scale, by the simple process of obtaining a better house at the same or even at less rent than they had paid before. Improvement in dress and general appearance, the healthier and cleaner looks of the children as they go regularly to and from school, are things not likely to pass unnoticed, nor will they fail to stir that healthy emulation which is one of the strongest forces in working people when once fairly aroused. Miss Octavia Hill's plan has thus one advantage over the excellent and praiseworthy schemes of the Peabody Trustees, and the Industrial Dwellings Company, which aim either at drawing the better class from amid the lower to a better locality, or at dealing in fact with a superior class altogether. By choosing a court, and doing all that can be done to make it clean and comfortable, a practical testimony of the most effective kind is raised up exactly where it is most wanted; and the more respectable labourer, while he is relieved from those

evils of close association with the vicious, over which Canon Kingsley so deeply mourned, is yet not so far removed from his old whereabouts as to fail unconsciously to influence his old neighbours, in as far, at all events, as his daily appearance gives evidence of his improved circumstances. Miss Hill has well written, with that keen perception of real possibility which comes from thorough experience, "The people's homes are bad, partly because they are badly built and arranged; they are tenfold worse because their habits and lives are what they are. Transplant them to-morrow to healthy and commodious houses, and they would pollute and destroy them. There needs, and will need for some time, a reformatory work which will demand that loving zeal for individuals which cannot be had for money, and cannot be legislated for by Parliament." And it is not too much to say that she has, in our idea, inaugurated and proved to be practical and remunerative, one of the best machineries of reform we have yet witnessed. But in it the element of personal interest and care is most essential—a point, too, which should not be for a moment lost sight of when this work is compared with that of the Peabody trustees or other societies or companies. A great deal more might well be said on these points. We must hurry on to take note of another experiment.

No deep but there is a lower deep. We cannot presume that our readers are intimately acquainted with the Mint in Southwark. It is not a region likely to attract those whose business does not lead them that way. What the Seven Dials is to Bloomsbury, what the Rookery is to Westminster, what the New Cut is to Lambeth, what Drury Lane is to the Strand, what Whitechapel is to East London, that the Mint is to Southwark. Mr. Timbs describes it as a nest of "debtors, coiners, fugitives, outlaws, and the like." There is, of course, a sprinkling of honest poor, but they find it hard to withstand the influences that are predominant. Drinking prevails, and public-houses flourish; street fights are to be seen any evening; and in the crowded three-penny lodging-houses are to be found many who dare not show themselves openly to the police. A few of the members of Surrey Chapel, several years ago, moved by the lack of spiritual ministration there, formed themselves into a Christian Instruction Society for the purpose of visiting the lodging-houses in the district. A goodly number of the landlords agreed to give them access,

and at first they spoke to the inmates as they sat in the dull, dingy kitchens, engaged in drinking, cooking, or sometimes quarrelling, as we ourselves have seen them. In some of the kitchens as many as eighty men were frequently addressed on a Sunday evening. By-and-by a cellar was rented for the meetings, and afterwards a school-room was taken; and at length out of this work grew two institutions, separate yet connected—the Farm House Temperance Mission and the Farm House Lodging-House. Mr. Thorneloc, one of the leaders of the movement, had discovered by means of the confidence with which he had come to be favoured, that many of the men in these lodging-houses had left their wives, drink in the bulk of cases being the cause. The thought struck him, after having been compelled to declare for temperance, that if a superior class of lodging-house were opened, something might be done towards bringing these separated couples together again; at all events those who were inclined to reform would thus be removed, if they chose, from the midst of the temptations that beset them in the ordinary lodging-house kitchen. Seeing that these lodging-houses are the homes of a large class, this he felt might be the beginning of something. Accordingly he made known his plan to some friends; money sufficient to buy the lease of two houses was procured. They were in a frightful condition; but they were thoroughly repaired. They have now eighty beds, which are always occupied; more than half of the lodgers being regular tenants. There is no condition that the lodgers be total abstainers; but no spirits must be drunk on the premises. Good order is easily kept, and the place is wholly self-supporting, though only 2s. a week is charged. In numbers of cases, wives and husbands, who had been long apart, have been brought together again, and by means of this house as a "stepping-stone," have found a way to homes of their own, and not a few of them have now been for years members of Christian Churches.

These cases abundantly suffice to prove that where the personal element is brought into play, and where prudence and firmness are united with Christian concern for the elevation of the lower classes, a rich harvest of reward may be reaped; and if those who have money to dispense would but put it into the hands of such wise and practical workers, a reform would soon be effected such as must tend at once to lessen our taxes and also our national shame.

H. A. PAGE.

THE STORM OF LIFE.

By HESBA STRETTON, AUTHOR OF "JESSICA'S FIRST PRAYER," ETC.

CHAPTER IX.—AT ANCHOR.

FROM a dream-
less sleep
Rachel was
roused, early
in the morning
before day-
break, by some
person stirring
about in the
rooms below.

She groped her way quietly down-stairs, and found the old man kindling a fire, and getting ready his breakfast, before starting out into the dark and foggy streets.

"Up betimes, Rachel!" he said cheerily, "up with the lark, ay! and before the lark in the winter. I've lost my head-man that did the very early jobs for me, or I only wait myself on the nobility and the gentry commonly. But St. Gregory's flues want cleaning, and I must see to 'em myself, for it's a particular job. I was coming from there last night when I fell in with you. Eh! but you're a handy lass, my girl! I like to see a body as can move about brisk and sharp."

"I've been servant in two or three good places," she answered, "and I'm handy at any housework. I can wash, and iron, and bake, and clean with anybody; only I've no character. If you and her could trust me."

A sudden hope had broken upon her that these kind folks, who had been so good to her and Rosy, might perhaps let her stay with them, at least for a time, as they were plainly in want of some one to do their housework, and mind the poor woman upstairs.

"Trust you," repeated Sylvanus; "ay! ay! my girl, I'll trust you. Only you keep in your mind as God sees you—ay, and loves

you always, though He mayn't be always showing it plain—and there'll be no fear of you going wrong. He isn't always nursing us, so to say, and kissing us, and making much of us, as you do with your little maid; and you'll have to leave that off soon, if she's to grow up a good serviceable woman. He sets us hard things to do—ay, and hard things to bear, till we're ready to cry out that He's a hard master; but all through it He's looking at us, and if you and me could only see His face, there'd be such a smile upon it when we were doing right, and such trouble if we were going wrong, that we couldn't go wrong anyhow. Didn't He give up his dear Son to come and tell us all about himself? That was love. Ay! God is love."

"I never thought much of Him loving me," said Rachel softly.

"Well, well!" he answered, "that's how we ought to think of Him."

He was silent after that, being busy with his breakfast. It was ready in a few minutes, and he bade Rachel sit down with him at the little round table on which it was laid.

"My girl," he said, just before finishing, "maybe you might like to stay with us a bit. Well, do. It isn't a superior place, such as you're used to; but when you've earned a character, so to say, I might speak for you at some of the grand houses I go to. Bless you! there's scores of the gentry know me, Sylvanus Croft; thousands and thousands of chimneys I've climbed in London, in old times, and seen the tops of 'em in all sorts of weather. There's no climbing boys about here now, thank God; though they tell me there are down in Liverpool, and in country places. Eh! God sees some sad sights! But you think about it, my girl. Mother forgets how old Sylvie 'ud be, if she was alive now, but she'd be about your age, I guess, and a great comfort to me."

"I don't want to think," cried Rachel earnestly, "I'd serve you and her on my hands and knees, if you'd only let me stay, and keep Rosy instead of wages. It shouldn't cost you much, I'd save so. And, oh! you'd teach us both to be good."

"Please God!" said the old man, nodding; "talk it over with mother, while I'm away. I'm agreeable—more than agreeable. The little lass 'ud be like a playfellow for me, and I'm beginning to be fond of play again, like a child, only I've had no playfellows."

Well, I must be off now, or St. Gregory 'ill think I'm never coming to his flues."

Rachel could hardly believe that it was true, as she stole softly up-stairs again to the attic, to see if Rosy was asleep. The little room seemed already to belong to her, to be her own home. The view from the window was charming to her, though it looked out only upon roofs and chimneys, and up to the open sky overhead. There was a small glass hanging against the wall, reflecting her wistful face, and rough, uncombed hair; but that should soon be smoothed again, she thought. Everything delighted her, and Rosy's face upon the pillow wore a look of peace and comfort, such as she had not seen upon it yet. Oh! if Rosy could only be safely sheltered and cared for! If they might but stay here with these good people, there would be days of play and gladness for her little child, even if she herself were bowed down and saddened by the memory of her sins.

To dress Rosy, even in her ragged clothing, and to take her down to the quiet and warm little kitchen, where breakfast was ready for her, was such a joy as Rachel had never felt before, and hardly dared to think of now, lest it should prove but a mocking dream. To see the child's gladness, as she warmed her little feet before the fire, was a delight. The cold and hunger they suffered only yesterday seemed already a long time since. There was only their torn and soiled clothing to remind them of it, and Rosy, like a child, had no thought about that. She laughed aloud once or twice, and Rachel stood and listened with a sob. Could it be indeed that her merry little darling was coming back to her?

As the morning light strengthened she set ready a breakfast-tray for the sick woman up-stairs, as daintily and nicely as if it had been for Mrs. Curtis of the Hall. She earnestly desired to gain Mrs. Croft's favour. When she found that she was awake, she set the white, pleasant room in order, and waited upon her quietly and deftly, in a fashion that the paralytic woman had never seen before.

"You're a handy lass," she said, as Rachel was about to carry away the breakfast-tray, somewhat downcast at Mrs. Croft's silence.

"Yes," she answered eagerly; "and, oh! if you would try me, and trust me, I'd serve you on my hands and knees. Only let me stay! You know the worst of me; I haven't kept back a thing; and you didn't turn me out of doors last night. It 'ud be almost like being in heaven for a night, and then

turned out again! I'd do better for you than any other maid could do."

She stood beside the bed, trembling with anxiety, her eyes fastened upon the pale, worn face, and grey hair, and sunken eyes upon the pillow.

"Ay, stay," said Mrs. Croft, "my old man is always fretting about me when he's away, and he's taken a fancy to you and your little girl. Stay, till we see how things go on. I'm very lonesome here at times, only for the thought of our dear Lord. He never leaves me, only I forget He's here, and fancy I'm alone, till it's as if He laid his hand upon me, and there comes a whisper in my heart that He hasn't gone away. Stop a minute, and I'll tell you how long I've been in this room."

She shut her eyes, as if to recal the long years, and count them as they went by, while Rachel stood looking down upon her, with tears standing in her eyes—tears that were more of gladness than sorrow.

"It's going on for eighteen years," she said. "Sylvie was a little bigger than your child, and I was proud of her, more than I can say; and I couldn't bear to think her father was a chimney-sweep. I'd come of better folks, and I'd been laundry-maid in great houses; and how I came to wed with a sweep I could hardly tell. But I would never let Sylvie go out with her father; no, nor never went out with him myself, for very shame of his trade. And nobody would believe Sylvie was a common child. It was a sore trouble to him, my pride and shame was, and I let him have no pleasure in Sylvie. Then she died quite sudden. I suppose I'd something like a stroke, but I was never right again; and he was so good to me, so good! He never said a word to blame me, though he were almost broken-hearted. Ever since then I've been lying here, till this place has come to be like the place where Jacob slept, and saw a ladder set up on the earth, reaching up to heaven, and angels ascending and descending upon it. I wake up sometimes, in the dead of the night, and say to myself, 'Surely the Lord is in this place.'"

"Are you scared?" asked Rachel. "Doesn't it make you afraid?"

"At first, at first," she answered, "but not now. If I could get the feeling that God was gone away, that would scare me. Oh! it would be dreadful to be in this place without God! It's all my comfort and gladness. Sometimes I say to myself, 'I am poor and needy, yet the Lord thinketh upon me;' and I feel in my very heart He is really thinking of me and my wants."

"If He would but think of me and Rosy!" sobbed Rachel.

"Eh, lass! but isn't He thinking?" cried Mrs. Croft. "Who sent Sylvanus in your way last night, when you were at the worst pinch of all? And who put it into our hearts to keep you, instead of letting you go again into the streets, and you'd have been thankful only to be let go? By-and-by you'll be glad to feel as if God was with you all the day long."

"Oh! if He would only forgive me and make me good!" sobbed Rachel again.

"He does forgive you, and me," she went on. "There was that poor woman, who was a sinner, and washed the feet of Jesus. The good folks wondered at Him for letting her touch his feet, she was so wicked. But He let her wash them; ah! and kiss them over and over again, and anoint them with her precious ointment. And then He said to her, 'Thy sins are forgiven.' Why shouldn't He forgive you? He came for the very purpose. Could He do more than He has done for us? There's a verse of a hymn Sylvie learnt once, I'll say it to you:—

"What could your Redeemer do,
More than He hath done for you?
To procure your peace with God,
Could He more than shed his blood?
After all his waste of love,
All his drawings from above,
Why will you your Lord deny?
Why will you resolve to die?"

The solemn words fell slowly on Rachel's ear. She could not understand them altogether; but the words that smote her heart most keenly were, "After all his waste of love." Oh! if He had thrown away his love upon her all these years, whilst she had been sinning against Him, what a wretch she was! She would love Him back again with all her heart.

"I can't ever wash his feet, like that poor woman," she said softly, "and I can't ever take Rosy to Him like those other women did their children, but maybe He'll let me show my love some other way."

CHAPTER X.—ROCKS AHEAD.

NEXT day Rachel was going about the house in an old print gown of many colours which had been lying by since Mrs. Croft had been paralyzed, and Rosy was dressed in some of Sylvie's clothes. Sylvanus was full of joy; he felt no suspicion of Rachel, and no dread of her turning out badly on his hands. Nothing was locked up in the house, and she had free access to every room. The place of a trusted and familiar friend was given to her at once, or rather that of a

grown-up daughter. The second evening she was in the house she found the old man sitting by the kitchen fire with Rosy on his knee and her head resting peacefully on his shoulder.

"I'm learning her to call me grandad," he said, with a short, happy laugh, "grandad! Why, it might be Sylvie, grown up, and married below her, like mother, and come home again with her little girl! We've been talking about our poor eyes, and what's to be done, and how we'll go to a famous doctor I know quite well, a very clever doctor, and see what he can do for us. Rosy and grandad will go to-morrow."

There was nothing serious the matter with Rosy's sight. Now that she had good food and well-shod feet and warm clothing, they were quickly well again, and Rachel could see once more the pretty blue eyes of the baby she had lost when her sin committed her to a jail. More than ever Rachel's life was bound up in her little girl. Week after week, month after month, glided by, almost unmarked, whilst she, and Sylvanus, and Mrs. Croft watched the growth of the child. It was a very quiet home, but it was like a Paradise to her; for no one fretted her, no one remembered her past life. Or if either the old man or his wife remembered it, neither of them spoke of it. When she herself looked back on the past as sometimes a suddenly awakened memory compelled her to do, she felt as if she were dwelling in quite another world. All was so tranquil and so simple about her; the daily work sufficient to occupy without oppressing her; the evening rest in the snow-white chamber where Sylvanus read aloud, or made her read to the listening mother in bed; the untroubled nights, with Rosy slumbering beside her; the unbroken but cheerful sameness, after the wild sin and sorrow of her former days; all made it to her like another world.

Mrs. Croft had not expected Rachel to settle down so quickly and so easily into this new life. She had looked to see her pine after the freedom and excitement she had once had, and she had dreaded lest she should some day break out of bounds and give way to old temptations, to her own grief and that of her husband. But Rachel had taken simply a simple belief. She believed, now she could trust in God's love, that He was at all times present with her and tenderly watching over her conduct. She no longer doubted this, or was afraid of that loving presence, and the desire for the old sinful pleasures, so grievous to Him and so dangerous to herself,

had passed away for ever. The thought of her old ignorance and guilt made her shudder as if she were looking back down some fathomless gulf, from which a Father's hand had saved her. Rosy must never fall into that gulf, as she had fallen!

"Mother," said Rosy, one Sunday evening after she had said all her hymns to Sylvanus, who held her tenderly on his knee, "Mother, is father dead?"

Rachel started, and dropped the tray, which she was reaching down for tea. The colour fled from her face, and her lips quivered. What could have put such a question into Rosy's head?

"They asked me at Sunday-school," went on Rosy, "all that had got kind, good fathers were to stand up, and I didn't know what to do. When I said I didn't know, they laughed out at me; but I told them you'd know, and I'd ask before I came again. Is he dead, mother?"

It was as if the child had been stabbing to her heart. Every word wounded her. So many months had passed by now since Sylvanus found them both in the street, that she had ceased to think anything of her husband. At first there had been a lurking fear of him disturbing her tranquillity; and now Rosy's question stirred up the old dread and anxiety. What could she say to the child? Had Rosy then forgotten that her father was a convict like herself?

"Is he dead, mother?" persisted Rosy.

"No," muttered Rachel.

"Why! I thought he must be dead," Rosy went on, "why haven't I ever seen him, grandad? Where is he gone to? Didn't he love you, mother?"

"Oh! hush, hush, Rosy," she cried, in quick, sorrowful tones, "be quiet now. I'll tell you all about him when you're a big girl, perhaps. You're too little yet."

"But what must I say at school?" she asked. "I thought I hadn't got any father, and I don't know where he is. I want to see him. Would he love me, mother?"

For a minute or two Rachel stood quite silent, thinking of her husband. How plainly she could see him in her mind, when he first made love to her! and when he took her home on their wedding-day, and laughed at her surprise at all the things he had bought for her! Had he really loved her then? She could remember how it was when the first freshness of their early married life was over; how cruel, and selfish, and ill-tempered he had shown himself, and how lazy, except when there was some wickedness afoot. He

had cursed the birth of their little girl; and she could not recall one pleasant word or smile given to the baby, who crowed and laughed in his face. He had been jealous of her, and enraged by his wife's passionate love for the helpless little creature, who was seldom out of her arms.

"No, he never loved you, my darling," she answered.

"My little lass," said Sylvanus, putting her off his knee, "run up to mother, and say your pretty hymns to her, till tea's ready. She loves to hear 'em; and then you sing till we can hear you down here; there's a little woman."

They listened in silence to the child's pattering feet climbing up the staircase. Rachel did not dare to meet the old man's eye. He had never uttered her husband's name to her, or referred to him in any way. Sylvanus knew nothing about him, except what she had said the night he had taken her into his home.

"Sylvie," said the old man, in a tremulous voice, "come here."

He had called her by his daughter's name once or twice before, and now the sound of it made her lift up her eyes to him. He was holding out his arms to her, and she threw herself down on the floor beside him, and hid her face upon his knee.

"My poor daughter!" he said, "my poor Sylvie! tell me about him. The Lord cares for him, too, ay! and He's ready to receive him back any day. The Lord laid down His life for him. Tell me all about him, Rachel."

"Oh! he is so wicked," she sobbed, "so bad! I should never have been a thief but for him. He 'ticed me, and drove me, and worried me, till I was almost as bad as him. I dreamed once as he'd come back, and made Rosy a thief! I couldn't be a good woman if he found me."

"Where is he?" asked Sylvanus.

"He was sent to Gibraltar," she answered. "He wrote once to me in Thornbury jail, but I never wrote back. He can't come back for two years longer, but every day makes the time shorter, and I feel scared lest he should find out Rosy and me. If it were only me, I'd shake it off, and try not to mind; but there's my Rosy, and just old enough to learn all sorts of badness."

"But, maybe," said the old man, "he's learned about the Lord, and his love, in prison, as you did, Rachel. The Lord knows all about him, as well as you and me. S'pose he comes home, set free from all his

"THE STORM OF LIFE."
Page 243.

sins, and ready to serve the Lord with you?"

"I never thought of that," cried Rachel, looking up with a tear-stained face, "yes, God sees him as well as me, and loves him too. If he'd only come home a good man!"

"Or, may be, you'd win him to be a good man," said Sylvanus, "why! if he were as bad as bad can be, and you were forced to live with him, and see it, it 'ud be only like the Lord dwelling amongst us sinners, and being grieved day by day, with our sins. But He's doing it to win us back to Him. Why! He might leave us alone, and live up in His glory in heaven, with the angels and archangels singing His praises, only He can't be content to leave us in our sin and misery. He'll be satisfied some day, the Lord will, and you'd be satisfied, Rachel, if you won your husband to be good, ay! though you had to go down into the pit for him."

"Ay, I should," she said, with a deep sigh, "only for Rosy."

"Well, well!" answered the old man, stroking her head softly, "the Lord will take care of His little lamb. Ay! and we'll take care of her too. You must run with this trouble to Him. Why! He isn't in some grand place a long way off, like the best rooms in a great house, far away from the nursery, so as the children's noise can't be heard. The Lord's in the nursery, and if any trouble scares you, you can run and hide yourself in His arms. He's ready to take up the very least care of ours, like you'd stoop to take a pin out of Rosa's pinafore, if it was going to prick her. You take this trouble to Him, my lass, and don't bring it away with you again."

From that time the only fear that had haunted Rachel gradually died away. Nothing hindered her now from a simple striving to be good. Her past sins had been forgiven, and her future life lay before her, untroubled by any doubt of God's love for her. True, she could not altogether forget the years that she had spent in a prison cell, and often the remembrance that Rosy inherited a sullied and sad name from her came, like a cloud, across her calm tranquillity. The past could not be blotted out, no tears could wipe away the stain of it: even God's forgiveness could not efface it. She had been a thief; no power in earth or heaven could alter that. She could never be one of those happy women who had resisted evil, and not fallen into sins like hers. But Rosy might be, nay, must be,

among that glad and good company, knowing God, and loving Him, from her very childhood. And for herself, she trusted that some day or other she might hear Christ saying, "Her sins, which are many, are all forgiven, for she loved much."

CHAPTER XI.—STRANDED.

PERHAPS, of all the members of that little household, Sylvanus was the happiest. He had suffered much, while his little Sylvia was living, from his wife's false pride, which had deprived him of the joy and pleasure he might have had in his child. After her death, he had sorrowed for her silently, never letting his grief betray itself before his poor, paralytic wife; and as the years had gone by, he had kept count of them, picturing to himself his little girl growing up into a woman, his grown-up daughter. When Rachel and Rosy came, he seemed to have restored to him, not only his grown-up daughter, but his little, prattling, playful Sylvie, who was allowed to watch for him at the door, and run down the street to meet him, even when he was coming home, soiled and begrimed with his work.

He was not now a struggling man, doubtful whether he could make both ends meet. He had his regular employers, and plenty of work for himself and the two or three men who helped him in his trade. Rosy's maintenance was no burden to him, and he used to say triumphantly that Rachel was worth her weight in gold. Never had the house been so clean, or his wife's room so spotlessly white. Never had there been so little money needed for housekeeping. Rachel baked and cooked, and washed and mended, as if the house were her own. It was her home. There was no mention made of her seeking a better place, or going into service in some grand house. Sylvanus pressed money upon her in payment, which she refused to have; and then it became an occupation and a delight to the old man to look into the shop windows, and buy the dresses he liked most for both her and Rosy. He had never tasted that pleasure before.

Now and then in the early summer time, when business was slack with him, Sylvanus would take both of them out into the country for a day in his little trap, which was specially cleaned up for the purpose. No words can tell Rachel's quiet gladness, on those sunny days, to feel her feet treading once more among the tufts of grass, and to see the cows feeding in the meadows, as in the old times when she was a girl, and was sent

morning and evening to fetch the cattle home, through fields scattered over with buttercups and daisies, and under hedgerows, where the hawthorns showered down their snowy blossoms upon her. Sometimes they passed by a farmstead, and she could hardly keep herself from cluck-clucking to the busy brown hens and little downy chickens, as if she had a lapful of corn to toss among them. And in the hay-fields, oh how they brought her merry childhood back to her, when she had helped to rake up the sweet-scented swathes of hay into cocks, standing all in lines like so many rows of thatched cottages, with a village street between them! Rosy did not gather the opening flowers more eagerly than she did, though Rosy's laughter rang through the quiet lanes, while Rachel smiled but sadly, when she did smile. The great storm of life that had burst over her so fiercely had swept away laughter and loud merriment from her.

Many and many a time had Sylvanus talked of going down to the sea-coast for a day, by one of the cheap trains. He had never seen the sea, nor had Rachel and Rosy, who came from an inland county. They had spoken about it on winter nights by the fireside, and on Sunday evenings after Rosy had said her hymns, speaking of it as some great and almost solemn holiday. But summer after summer had gone by without bringing the exact day when the pleasure could be taken without drawback, until it had become almost like a dream to them all.

At last the dream was to come true. A splendid Whit week was gladdening all the people, and holiday trains were running every day to Brighton at low fares, and starting so early in the morning that they would be some hours on the coast. Rosy was nearly ten years old now, a pretty, bright-eyed girl, well made and healthy, the very life of the house. Sylvanus believed that no such child had ever lived before.

"Rachel," he said on Whit-Monday, "the time's come at last. To-morrow we'll be off to the sea. You go and buy something nice for us to eat, such as the little lass 'll like best, while I seek somebody to stay with poor mother all day. Poor mother! if she could only come with us, I'd be the happiest man in London, whoever the next one might be."

"Let me go with you, mother," cried Rosy eagerly, "and I'll carry your basket for you."

"No, no," answered Rachel, "you stay

at home, like a good girl, and read something pretty to Mrs. Croft. She'll be by herself all day to-morrow, while we're enjoying ourselves, you know."

"I'll stay if you'll give me twenty kisses," said Rosy, clinging to her and hindering her from setting off. Rachel kissed her fondly, and looked back as she passed over the door-sill, to see her standing at the foot of the staircase, nodding and smiling gaily. It was a lovely day, and Rachel herself felt more light-hearted than usual. The month of May was drawing to a close, and the sun had been shining in a cloudless sky since its rising, yet there had been no sultry heat, even in the streets of London. A cool freshness was in the air as soon as the sun sank down in the west, foretelling heavy dews out in the country, and overhead light filmy threads of silver mist floated slowly across the blue, taking tints of rose and gold as they caught the rays of the setting sun. There was no fear of the weather to-morrow, for the sky was deepening into red. "Red in the morning is the shepherd's warning, red at night is the shepherd's delight," said Rachel to herself as she passed busily through the streets on her errands, and thought of Rosy's joy. She wondered what the great unknown sea would be like. She had seen many pictures of storms at sea, when wild waves tossed the ships about like cockle-shells, but she could hardly believe it would look like that under a calm summer sky, with only breeze enough to fan her cheek softly. Well, to-morrow she would know.

The station from which they would have to start was less than a mile from their house, and she was so near to it when she made her last purchase that she thought she had better go on and inquire particularly the exact minute early in the morning when the train would set off. The streets were all in a stir about the station. Rachel made her way along, down the covered approach to the entrance of the ticket-office, smiling as she thought how Rosy's feet would dance along the pavement at her side, how Rosy's tongue would chatter when they were fairly off on their day's pleasure, and how Sylvanus would pace on, with his grey head tossed back a little, and with a beaming look spreading over his furrowed face. What a happy day it was going to be to-morrow!

All at once there flashed across her mind the memory of the summer day when she had stood at the bar before the judge, and the sun had shone in upon her through

some uncurtained window till she could not lift up her eyes to see his face. Why did she think of it now, when the thought of it had slept so many months? She tried to shake it off. No one could suspect her of ever having been a jail-bird. Her face had lost its old gloom and sullenness; she was neatly dressed, and her manner was soft and quiet. Even if she went back to her native place, no one could know her for the wild, giddy, unprincipled girl who had so swiftly brought shame and sorrow on herself. The porter to whom she spoke answered her pleasantly and civilly, not at all as if he could guess what she had once been.

"At five o'clock precise, the train starts," he said; "and if you'll take my advice, you'll be here at 4.30 to secure good places."

"Oh! we'll come in good time," she answered; "my little girl'll never sleep a wink all night."

There was a group of idlers loafing outside the door of the ticket-office, but Rachel had not glanced at them. Her clear voice had spoken so distinctly as to cause her words to be heard above the clamour of other speakers. One of the men, who was lounging against a pillar, started up at the sound.

"Why, Rachel, my girl!" he cried with an oath. "Rachel!" and he laid his hand upon her, "don't you know me again, my lass?"

Know him! As his voice fell upon her ear, all the sunny light and the merry sounds about her grew dim and confused. Her heart was ceasing to beat, and all her strength was passing away from her; but she did not fall, for the man who had spoken to her caught her in his arms, and at the feeling that his arms were about her, a pang of terror brought her back fully to her senses, and to the reality of the great misery that lay before her.

"Rachel," he said again, "cheer up, my girl. Why, you're prettier than ever! She's my wife, lads, that I've been hunting for up and down the country, and all about London here. It was misfortune parted us, no fault of hers or mine. But I'm her husband, and she's my wife, till death us do part, the parson said. I'll not let thee out of my sight again. Come, give me a kiss at meeting, Rachel."

But she had wrenched herself out of his grasp, and stood leaning against the wall for support. She felt scarcely strong enough to keep from falling to the ground. A crowd

was quickly gathering about him and her, watching and listening with a sort of pleasure in her misery, but not one face was distinct to her, except his, her husband's. He did not put his hand on her again, but he stood close beside her. There was no chance of escape from him.

"I've been down in the country seeking you," he said, in a loud voice, so as to be heard by the policeman, who was forcing his way through the crowd towards them. "Mrs. Curtis said you'd come to London, but she knew nothing more about you, and you'd never wrote again to her. Old Curtis is dead. Where are you and Rosy living here?"

"Oh!" she cried, in a voice that was lamentable to hear, "I'll never let you know where my Rosy is! Will anybody tell me if I'm bound to go with this man? He's my husband, but he's been away from me more than eight years, and I don't know whether he's any right to claim me now."

There was something so mournful about Rachel's voice and manner, and the man who claimed her was so disreputable and worthless a scoundrel, with such a hang-dog look about him, that the feeling of the greater number of the lookers-on was enlisted on her side. But by this time the policeman had pushed his way through the crowd, and stood looking calmly on, ready to settle any question in dispute. Trevor whispered a few words in his ear, and he turned to Rachel, speaking authoritatively, yet almost pitifully to her.

"You'll have to go back to him," he said; "it isn't as if he'd kept away from you of his own free will. If you're married to him, you're his wife, and the law says he's a right to claim you. I can't say anything contrary to law, and that's the law."

"I don't want to force her away all at once," said Trevor, but it's only fair I should know where she's living, and where our little girl's living. I've a right to my own little girl, I reckon. I'm able, and ready, and willing to make a home for both of 'em; and I'll be as good as a man can be to 'em both. I can't say fairer than that, can I? Only let her show me where she's living, and I'll leave her alone for a day or two till she's pacified and content."

While he was speaking a great struggle was going on in Rachel's heart. She must never, never let her husband know where Rosy lived. Rosy, her pretty, bonny girl, just old enough to need more care and watchfulness than ever, how could she let

her be dragged down into the shameful depths into which her father would plunge her? Yet to save her she must make a living, an entire sacrifice of herself. She must consent to forego everything that was precious and good to her; even the small easement of her own hard lot which Sylvanus and Mrs. Croft could give. She must herself shut the door upon all hope, and peace, and comfort; from all chance of help to live a Christian life; and she must go down, step by step, into the great gulf where no light could reach her. "God help me!" she murmured, "God help me!" But her soul was too troubled for her to feel how near He was to her just then.

"I'll go with him," she said, looking despairingly into the policeman's face, "if I must go; but I'll never let him know where my little Rosy lives."

"You hear her," said the policeman in a sharp stern tone, "she says she'll go with you. Now, take her off, out of here; and mind how you behave to her, my fine fellow, or a magistrate 'll give her a divorce from you. If I could have my way she should go scot free now."

Trevor was too cowed to answer, though he drew Rachel's hand through his arm, and marched off blusteringly. A few persons followed him and his unhappy wife for a little way along the streets, and he out-stared them in an insolent manner. Rachel walked beside him in dumb despair. At last one by one their escort fell away; and they were left alone, mingling unnoticed with the stream of passers by, not one of whom could guess the wretchedness that was breaking Rachel's heart.

CHAPTER XII.—WAVE UPON WAVE.

TREVOR hardly knew what to do now he had discovered his wife. He had no place to take her to, not even a lodging; for since he had been in London he had turned into any low den, in the worst streets, for a shelter at night. His time was not yet served out; and though he had destroyed his ticket-of-leave, he was too much afraid of being known as a felon, to be willing to bring himself under the notice of the police. He determined to speak softly to his wife. In old times she had had a will of her own, and he knew he could do little with her by sheer tyranny.

They were not far from Hyde Park, and Trevor turned his steps towards it, for there they might find a place quiet enough to talk in. The sun had set by the time they reached

it, but the birds were singing merrily in the topmost branches, where the light still lingered. A star or two was shining faintly in the sky, and the creeping twilight was softening everything about them. Rachel knew that they would begin to wonder at home what could keep her out so long. Rosy was watching for her to come up the street, and fancying she saw her in the dusk. She sank down on one of the park seats, and covering her face with her hands, burst into a passion of tears. She had not uttered a word since she had heard her sentence pronounced by the policeman; but at the remembrance of her peaceful, lost home, she cried aloud, "O God, help me! O God, save me!"

"I don't mean to be hard on you," muttered Trevor, "only you're my wife, you know, and Rosy's my child. Why! I mean to be good to you both. You just show me where you two are living, and I'll not come near you again for a week. Come! that's fair, and you can go your pleasuring to-morrow all right. I don't want to spoil sport. Rosy 'll be a big girl by now, I reckon; and if she takes after you, she's a pretty one, I'll wager."

"Trevor," she said, with difficulty mastering her tears, and speaking as clearly as she could, "if you'd tell me where you live, and let me go home this once, without following me, I'd promise you faithful to come anywhere you tell me; to-morrow, or any day you fix. I would for certain. Only I want them at home to know what's happened, and how it is I must leave them all."

"You aren't married again?" he interrupted, sharply.

"No, oh no!" she cried, "I'm in service. Don't look like that at me. They are good folks I'm living with, and they've taught me to be good."

"Good!" he repeated, "you used to be a good one, as good as any girl in England. You were fond of me once, Rachel; what's come over you to turn so rough on me? Scores, ay, hundreds o' times I've thought of you, out yonder, you and Rosy; and I've said to myself, 'Lad, there's one that's true to you as 'ill welcome you kindly when you get back again.' Why, when Mrs. Curtis told me nobody knew what had become of you, you might have knocked me down with a straw. I'd counted on you watching out and waiting for me. Times and times again I'd have given all I had in the world for a kiss from you and Rosy."

Rachel's heart was stirred again to hope, as she listened to her husband's kind and

gentle words, spoken in the same low tone he used to talk to her in the days long ago, when she had often stolen away from the Hall kitchen to meet him in the rickyard, amid the ricks of scented hay. She could hear again the rustling of wings and the chirping of the crowds of little birds under the thatch of the corn-stack, and the lowing of the oxen in the farm-yard close by, and the swinging-to of the gate on its creaking hinges, which gave them warning that somebody was nigh at hand, and made them run, half-laughing and half-frightened, to hide

themselves in the deepest shadows of the brown ricks. She had loved him then in her way. It was quite true, and her heart beat with a feeling of the old tenderness coming into life again. In the growing dusk of the evening she drew closer to him, and kissed him as she had often done in the Hall stack-yard.

"Oh! if you were only a good man!" she sobbed, "we might all be so happy again, you and Rosy and me. Wasn't there any good chaplain out yonder to teach you about our Saviour and God, that sees us always,

Page 151.

ay! all we've ever done that's wicked, and spite of all loves us yet? The chaplain at Thornbury taught me first, and the folks I live with now taught me more; till I can never be the same again."

"It's nothing save an old woman's tale," said Trevor, with a sneer, "or it's only what rich folks 'ud have us poor folks believe, to keep us down. They don't believe God sees 'em, idling away their days, and making ducks and drakes of their money, whilst folks are clemming to death close by, and have nought save the bare floor to die on.

No, no, Rachel. They don't believe that, and they've got all the learning; only it's safe for them to teach us so. I thought you'd been sharper than to swallow that."

"I couldn't give up believing that," she said softly. "I love to think of it."

They sat silent for a little while; Rachel pondering in her mind what she ought to do. There seemed no choice offered to her; no way of escape was open, though she seized eagerly upon every thought that crossed her bewildered brain. Trevor's face told too plainly its story of a drunken and vicious

life, for her to hope that there was any change in him, even if he had made any profession of being reformed. He looked harder and more cruel than when he was a young man. Yet there came a great flood of pity and sorrow for him across her heart. His state was so miserable, so helpless; as wretched as her own had once been, before Sylvanus Croft had rescued her. He seemed so neglected and so desolate, as though neither man nor woman cared for him. The very rents and tatters in his clothing appealed to her. She was his wife; no one stood so near to him as she did, and she had chosen to take her place beside him, when she married him! If only he was not Rosy's father.

There was the rub! But for Rosy she was ready, almost willing, to leave her tranquil, comfortable home, and share his lot with him. It would be wretchedness to her to be forced into companionship with evil; but she was a grown woman, with some strength to defend herself, and with God's help she could overcome temptation, and live a good life, if an unhappy one, with her husband. It would be her duty to do so. She might even win him back at last; and have the joy the angels in heaven have over one sinner that repenteth. But Rosy could not live in the midst of sin. No; she must die rather than let him know where her darling was.

"Come, Rachel," he said pleasantly, "a penny for your thoughts!"

"I'll go with you," she answered, in a mournful tone, "wherever you choose to take me, and I'll be as good a wife to you as I can. Only I can't give up believing in God, and trying to be good; no, not if you killed me for it; and you won't like that. I don't know what rich folks and scholars believe, but ever since I've felt sure that God sees us, and loves us, bad as we are, and low as we are; why! I've been a better woman and a happier woman than ever I thought to be when I was in Thornbury jail."

Trevor whistled the air of an old song, which Rachel remembered well, but before he came to the end of it he stopped suddenly.

"Well," he said, "are you going to stop here all night?"

"I'll go where you go," she answered. "I haven't got any home but yours now."

"Aren't you going to show me where you live then?" he asked.

"No, never!" said Rachel. "I'll never tell you where my Rosy is, though it'll break my heart to keep away from her. But she's safe, and happy, and good where she is; and, please God, she'll never be like me."

"But I'll find her out!" said Trevor, with an oath. "She'd be worth any money to me. You'll never keep away from her, and you'll never keep up your religion where we shall have to live, my fine lady. Why! do you think God sees the places folks like us live in? He'd burn up London with fire and brimstone if He did. No; the rich folks think we poor folks are born to be trodden on, like their slaves; and we poor folks don't see any harm in robbing 'em if we can get the chance. It's all fair play; only there's no religion with them or us, Rachel."

But he tried again and again to turn her from her purpose, and consent to show him where she had been living. It was all in vain; she stood firm, though her heart was wrung by the thought of Rosy. The night had closed in before Trevor gave up his effort; and the sky, clear and cloudless, was studded with glittering stars.

At length, in angry and sullen silence, he took his wife by the arm, and threaded his way through many dark and narrow streets, to the low lodging-house where he was most sure of meeting with some of his boon companions. It was a low and filthy cellar, crowded with vicious occupants. Though Rachel had stayed in many a comfortless place while she was wandering, a beggar, in the streets, she had never set her foot into a den like this. She found the darkest corner for herself, and crouching down as much as possible out of sight, strove to be blind and deaf to all that was going on about her. Trevor left her alone. He might have been tempted to vent his ill-humour and disappointment upon her, but he had not forgotten the policeman's hint. He would take care to keep clear of any personal cruelty which might end in giving freedom to his unhappy wife.

THE USE OF WASTE SUBSTANCES.

NO. I.

“WASTE not, want not,” is a maxim instilled into us from our earliest childhood. It is very good as far as our knowledge goes, but that is a very little way indeed. What the most learned of us know with respect to waste, is infinitesimal compared with our good mother Nature; she, indeed, has no such word in her universal dictionary, and this mankind is slowly finding out as knowledge progresses. We find that in the universal alembic of nature, not only is nothing lost, but that the most offensive refuse contains within itself the essence of things which astound our senses with their beauty. The coarse efforts of man in analyzing his so-called waste, are not to be mentioned in the same breath with the perpetual but silent operations of our great mother, but it is interesting to observe, as the pressure of the population increases, the efforts he is making to utilise every particle of refuse which arises in large communities. Speaking broadly, for instance, it would be said that the dustbin was one of the best examples of waste and refuse that could be mentioned, and in the aggregate it is discovered that the yearly value of London dust collected from its 600,000 houses, amounts to many hundred thousands of pounds.

Why it has so long been allowed to flow into the exchequer of the private dustman, instead of that of the parish, where it is required for the reduction of the rates, has long been a puzzle to those who have given the matter a thought. Let us for a moment investigate the process of analysis that goes on day by day in the vast dust-heaps that we see rising over the yards of the dust-contractors. Here, by a mechanical process, we may see the mass divided into its constituent parts in a much clumsier fashion than it is effected by the chemist in his laboratory. The hill-women, as they are termed, may be called the agents and the reagents by means of which the refuse we are so glad to eject from our dust-bins become converted into valuable material, useful in the arts, manufactures, and agriculture; and, strange to say, the new uses to which they are converted are often of a higher nature than that which they originally subserved. Many of us who feel the pressure of the coal-bill during the winter season, have shrewdly suspected that there must be a great leakage of fuel through the carelessness of servants,

and that it finds its way through the dustbin. This suspicion is more than realised by the fact that the chief value of the dust is to be found in the lumps of coal rescued by the hill-women. These poor creatures—it is a shame women should be so employed—sieve in hand, eliminate the coal lumps, whilst the cinders and half-burnt fuel are thrown aside for another purpose—no less than that of rebuilding London. The dust-contractors may be considered to perform a double duty to the commonwealth; not only through their agency is the offensive matter of our households withdrawn, but the houses themselves are both built as well as preserved. Independently of their duty as dust-contractors, they are also brick-makers, and they utilise the half-burnt ashes and cinders in baking these bricks. As we go by rail along the suburbs, we see vast stacks of bricks slowly cooking in a smouldering smoke. The bricks are, in fact, loosely built upon this “breeze,” as it is called, and by means of a judicious draft, caused by the careful disposal of weather-boards, the “breeze” is fired and kept smouldering with a dead heat, which speedily bakes the bricks. The coal itself is sold to the poor. Indeed poverty, with her meagre rags, warms herself on the refuse that falls from the fire of the rich men. It is quite a sight to see the scramble there is at the dust-yards among these poor creatures for the chance of getting their morning’s supply. The hill-women are allowed to take away with them all the old laths and pieces of wood in the dust.

The value of the coal refuse in the metropolis is the dust-contractor’s chief profit, but there are a score of other matters which his diligent agents collect. The hill-women, with amazing rapidity, collect these around them in different heaps—rags, old paper, bones, crockery, glass, old iron, and other metal, &c. The money they find they are allowed to keep themselves. The rags, of course, go to make paper, so do the clean pieces of paper; but our supply of this material is wholly insufficient to meet even the demand of the newspapers for their broadsheets. Year by year the requirements for the current publications has become more exacting, and other materials are come, not only to eke out the rags, but actually to supersede them. For years esparto, a grass from Spain, has been the main source of supply for the

Times. Those who travel by the South Western rail must notice the huge piles of this material, which are daily unloaded from the barges at Wandsworth. These huge piles, as big as four or five cottages, disappear in the course of two or three days, to supply the paper-mill, and are as rapidly replenished. Straw is also very largely used in the manufacture of paper; and in France the grass known as *Stipa tenacissima* is very largely used. Of this material vast quantities grow on both sides of the Mediterranean, for about five degrees of longitude.

Even the old printed newspapers are utilised, as they go to make *papier-mâché* ornaments. Bones re-enter society under a score of different addresses. Those which come from cooked meat go immediately to the boiling-houses, where any residual fat and gelatine they can yield is extracted. The fat, of course, goes to make soap, and the gelatine, for making the transparent packets used for various chemical preparations, and for cosmetics. The bone itself subserves a hundred useful purposes. The turners mainly employ it, when in sufficiently large pieces; the smaller make the fine animal charcoal, and, lastly, it is ground down, and, by the agency of sulphuric acid, it is transposed into superphosphate manure. Once having touched the earth, like Antæus, it rebounds with fresh vigour, and bears with it all the fruits of a replenished soil.

Glass is carefully preserved for remelting. If, however, La Bastie's patent turns out to be workable, there will be but little of this in future dust-heaps. It is asserted that by tempering articles manufactured of this substance in oil, it becomes unbreakable, and we have ourselves thrown tumblers and other glasses on to the stone floor without in the slightest degree damaging them. Even fine watch-glasses bear an iron-heeled boot to be turned round on them, placed upon a stone floor, without fracturing them. Like the Prince Rupert drop, however, when once broken they fall into a fine dust. We hear that the weak part in glass so made, is at the place of fusion. For instance, a wine-glass is made up of three pieces—the cup, the stem, and the foot; at the place where these joins take place, it is said that they are still liable to fracture.

Old medicine bottles are transferred to the dust-bin with great thankfulness; we get rid of them, we fancy, for ever, but it is as likely as not that we get them again with the next illness. Certain it is that they only visit the dust-bin for change of air, the sick-room and

the chemist's shop occupying the rest of their time.

Metals of all sorts are valuable "finds," especially brass and copper, broken portions of ornaments, the remnants of children's toys, &c. But especially iron in its various forms of broken manufactured articles, as they contain much solder, which is far more valuable than the iron. Horses' shoes and nails are especially valuable, as they furnish a peculiarly tough iron, used for making the famous stub-twist barrels of guns.

Old woollen rags are very valuable, as they go to make the famous shoddy, of which we have heard so much. All the old clothes of Europe, when past reviving, greasy to saturation, and in tatters in fact, and past all decent wearing, come ultimately to Batley in Yorkshire, where in the shoddy factories, by means of huge cylinders studded with teeth, they are reduced to their original fibre, and re-enter life in combination with newly-woven wool. These old rags are equal to a contribution of twenty-five thousand tons of this material. By means of this introduction of the old to the new stuff, a score of fabrics have been introduced which clothe the poor and the lower middle class. If it were not for this re-introduction of a once perfectly waste material, woollen clothing would be so costly as to exceed the means of the working population. It has been the custom of late to mix woollen with cotton in the production of what is termed union goods. This mixture for a time puzzled the manufacturers, as the combined material could not be usefully treated. The plan lately adopted is to put such fabrics into a closed receiver, and to heat them with steam at a high temperature. By this means the cotton is preserved in a clean condition for paper-making, and the wool is reduced to that great fertiliser, the ultimate of ammonia.

All greasy rags, such as dishcloths, those employed by engineers in the cleansing of machinery, minister to a curious purpose. They are past even shoddy-making, but by a curious turn of fortune advance at once in the scale of noble uses by being transferred to the hop-grounds of Kent. Beer from dishcloths! a noble ascent doubtless, in the working man's opinion. Old boots and shoes, of course, go to the cobblers. In their hands they are transferred into apparently new ones. New soles are added in the form of old pieces of leather pressed by steam into solid pieces; whilst uppers, when injured, are cut down into smaller uppers for children's boots and shoes.

Small fractures are hidden by what in the trade is called "a smother," or application of heel-ball; and really worn-out boots and shoes, in a few hours after being turned out from the dust-heap, are made to look quite respectable.

Old clothes may be termed the most noble form of refuse that we throw aside. When a pair of pantaloons has been shrunk, or the fashion of a frock or dress coat has changed, the bachelor throws them aside, or his housekeeper transmutes them into geraniums or fuchsias the first time the costermonger comes round with his barrow, or Ikey calls "Old clo'," and offers some cheap jewellery in exchange. The family man is not so imposed upon. When clothes are too bad for paterfamilias, they are made to descend to the younger scions of the house, through the instrumentality of the woman tailor. The old-clothes men, however, manage to intercept the main stream of old clothes which is for ever flowing towards Seven Dials and the Old Clothes Exchange in Houndsditch.

It is a curious if not an odorous exchange. Both women and men are to be seen eagerly inspecting the various lots put up for sale, scanning most carefully the skirts of coats and dresses, the uniforms, the ladies' finer apparel, before the auction comes on, glancing at their possibilities. Old clothes, if possible, are made to re-appear in their original shape, but so improved by pressing, so brightened up by "reviving" with some appropriate dye, that they look as good as new. Old swallow-tailed coats all go to Ireland; that is the reason why Paddy is always to be seen in the long-tails of the dandies of a past generation. Old uniforms are very valuable. When in pretty good condition they are sold for masquerades, fancy dress balls, &c.; when worn out, what does our reader think becomes of them? They are sold to the Dutchmen, who have a fancy to have under-waistcoats made of them. The red colour, as they rightly believe, retains the heat of the body better than any other—a very important matter in the cold, damp climate of Holland. But what becomes of the liveries of lord mayors' footmen, of beadles, of court flunkies? They are indeed prizes over which the Israelitish eye glows. The gold in them is considerable, but they are too valuable even for this disintegration. They find their way to the courts of African potentates, where they flash forth in a meridian sun, making their bearers rival the brightness of Oriental

fireflies. Ladies' dresses, of course, are taken stock of by the women, who revive them and remake them. Black velvet and black silk are, of course, the most sought after. Where dresses, male and female, are not good enough to restore as they were, in consequence of being too much worn, they are cut up and remade into smaller suits, or into waistcoats. Where, indeed, there is insufficient tolerably good cloth for this purpose, they are converted into caps; even when too small for this, they will do to make pen-wipers. When it has passed this second stage of its existence, it finally becomes, as we have before shown, converted into shoddy, and awaits a third existence; and ultimately, in the shape of ultimate of ammonia, passes to the final destination of all things, the earth, as manure.

As we have seen our clothing to earth, from which it sprung, and noted that shoddy, after the bad name given to it, has risen in the scale of value, having been transferred from the back of the beggar to that of the gentleman, let us turn to what may be termed the shoddy of our food. We shall refer by-and-by to the astounding amount of waste that is going on in the vast plains of South America, Australia, and New Zealand; but the mention of shoddy is too enticing to permit us to avoid here referring to it, as it affords a direct parallel to an article that now enters our food, and without which the poor man could no more indulge in his pat of fresh butter than he could in a new great-coat. The editor of the trade journal, the *Grocer*, with a grim smile which must have convulsed the compositor who set up his copy, slyly asked in his pages the other day, what becomes of the tallow? . . . "The beauty, cheapness, and brilliancy of the paraffine wax and the mineral lamp-oils have brought them into use everywhere among all classes, and in all countries and situations. The tallow-candle seems going the way of the old tinder-box; and tallow is only used as an exceptionally high-priced and luxurious lubricant. Thus it appears that the demand for tallow is wonderfully diminished, while the Australian supplies are increasing. How is it, then, that the price of tallow keeps up? What answer can be given to the question? What does become of the tallow? It is well known that vast quantities of kitchen-stuff and Australian fat, which formerly were consumed by the tallow-chandlers and soapmakers, have lately found their way into the empty Dutch and other butter tubs, which are now bought up more

freely than of old ; that much of this purified fat has been shipped into Holland and other butter ports for the purpose of admixture ; and although the monstrous newspaper nonsense about making butter from Thames mud is utterly baseless, the River Thames has borne upon its bosom many and many tons of white fried fat that has been prepared within a moderate distance of its banks. . . . At the present moment fresh butter is offered for sale in some parts of London at 1s. per pound retail, while the farmers are selling their produce wholesale at 1s. 4d. to 1s. 8d.¹¹ It is pretty clear that clarified fat is the shoddy of our butter, such as the working-class get under the name of butterine ! Now the *Grocer* very justly adds that so long as this mixture is admitted, it is a vast addition to one of our most important food sources. A sop-in-the-pan and dripping-toast were considered a treat in the writer's young days, and we see nothing in the slightest deleterious to health in clarified fat. Indeed, it is quite as nourishing as cream-made butter. But then it sounds so horrid ! that such a Cinderella of the kitchen should dare to make any comparison with the Dolly of the milkpail ! It is the old tale of the iniquity of mixing shoddy with wool ; but as long as the pure article is, as at present, beyond the means of the working man, the admixture will continue to the benefit of all parties.

The subject of butter naturally leads us to bread. Whilst we are not prepared to say that we may economise our flour by substituting for it bread made out of sawdust, which has been boldly asserted we might do, we wish to draw attention to the cleverness of a Parisian, "an old soldier," by the way, who in the course of his occupation of a *ravageur*, finding that the *chiffonniers* picked up a vast quantity of pieces of stale bread, which they could not sell, determined to turn the fact to account, and commenced business as a manufacturer of bread-crumbs. He speedily found that the supply from the *chiffonniers* was not to be depended upon. He consequently made an arrangement with the cooks and scullions of the schools and colleges, and set up as a manufacturer of bread-crumbs. When last we were in Paris, this old soldier had established a fine business, and employed a vast number of persons in pounding and baking and grating bread for his celebrated commodity. Finding that he could not repay himself for the expense of sorting the good and the bad bread, he invented a new industry—*croûtes au pot*. It is only at the first-rate hotels that you can

depend upon getting soup *au pain au croûton*. In the cheaper hotels *croûtes au pot* are not obtained from such cleanly sources as from Le Père Chapellier's bakery, who, we are told, no longer depends upon the stale bread, but bakes it fresh at his own manufactory at the Barrière St. Jacques.

The use of waste has met with no instance which comes home to us with more telling effect than with regard to the supply of flesh-food to this country. Whilst beef and mutton are selling for a shilling a pound, millions of oxen and sheep are roaming upon the vast prairies of the New World, if not mere refuse, at least worthless to us as surplus stores of food. If we could transport these countless herds by water, they would at once subserve their highest purpose—the nourishment of man ; but that being found impossible, they descend at once in the scale of value, and are sacrificed for the mere worth of those portions of them which in this country are of the meanest value. It seems the coarsest form of retrogression to know that countless flocks and herds are moving in one ceaseless procession towards the steam-boiling vats across the great ocean, where they are boiled for the mere purpose of extracting their fat, bones, and hides. In the great cities of Australia, however, civilisation has advanced beyond this mere disintegrating process, and has employed machinery to preserve the flesh as well as the details we have referred to. Mr. Simmonds, in his interesting volume on "Waste Products and Undeveloped Substances," gives the following interesting account of the method of slaughtering and turning the carcasses of bullocks to account in New South Wales. Machinery is employed in nearly every department :—

"The beast, instead of being driven into a comparatively wide space, and exposed to the cruel and protracted method of killing usually resorted to, is brought into a place so narrow that he is incapable of movement or resistance, and dispatched by the butcher at once, with the greatest ease. He is then lifted for skinning by machinery, and as soon as the hide, head, horns, &c., are removed, the carcase is let down on a chopping-block running on a tramway ; it is then cut into convenient-sized pieces, without the necessity of the men handling or lifting the meat, and the trolley chopping-blocks run on the rails to the other end of the building, where the boilers are. The meat is then lifted from the chopping-block into the boilers by means of endless chains, with hooks attached, passing over sheaves, and driven by steam. The

boilers are large, steam-tight double cylinders, and capable of holding upwards of fifty bullocks at a time. When filled with meat, the orifice at the top of the boiler is closed, and the steam is let in at a pressure of fifteen pounds to the inch. In about seven hours the whole mass of meat and bone is reduced to a pulp. The steam is then condensed, and the tallow flows upon the surface. On a tap being turned, it flows into the refining-pans; and when the refining is completed, by turning another tap it flows into large, shallow coolers . . . and is thence conveyed to Sydney. The mass of pulp by which both bone and flesh has by the steaming process been reduced, is then removed from the boilers by means of an opening near the bottom, fitted with a steam-tight door. It falls into a powerful press, also running on a tramway, and the strong pressure being applied, a large quantity of highly-concentrated soup is extracted. The flesh and bone having by the pressure been made into enormous solid cakes, the trolly-press is run into the piggery, and the greaves given to the pigs. The concentrated gravy or soup is then placed in a peculiarly-constructed boiler, and reduced by evaporation to such a consistency that when cold it becomes solid, previously to which, however, it is run into bladders."

When we are told that an average bullock makes twenty pounds' weight of this portable soup, we see at once the Homeric nature of the style of cookery worthy to provide concentrated soup for the gods. It is at least gratifying to know all the good beef is not so disposed of. Some of the best bullocks have the bones extracted from their prime portions, which are then salted, and cut into strips, and constitute what is known as "charqui," the South-American name for "jerked beef." The supply of this article, we are told, is unlimited. Why has none of it found its way over to this country? We are told it goes mainly to feed the slaves in South America and the freedmen in the Southern States of North America. Surely salt beef would be a welcome addition to the meat-supply of our own working classes whilst meat is at its present prices; but we are told that the British workman will not touch it. He goes in for his beefsteak at 1s. 2d. a pound! Nevertheless, there are many respectable people of the lower middle classes who are not so fastidious, or rather they cannot afford to be so luxurious, who would be glad of this despised jerked beef.

But we trust that Mr. Appert's plan of preserving meat *in vacuo*, which, indeed, was

discovered as long back as the year 1811, will force its way into public use as a triumphant success; in that case we can leave the jerked beef to the slaves in South America. In 1839 Appert's preserved meat in tins was adopted by the navy, under the name of Goldner's canisters. It will be remembered that the agent who supplied the navy board obtained these meats from Moldavia, and not having been particular enough in sealing them, a few cases arrived in a putrid condition. Henceforth Goldner's canisters were associated with everything that was disgusting—it became a byword in fact; but now that we are forced to find some addition to home-grown meat for the million, it is seen that it was absurd to forego the vast excess of food in Australia, in consequence of the negligence of the agent in sealing the tins. But let us inform our readers of the method of preserving the meat quite fresh. The round tin in which the meat (previously deprived of bone) is rolled and placed, is covered with a top and hermetically sealed, with the exception of a pinhole through which the steam is allowed to escape. The tin is then placed, together with others, in a bath of chloride of calcium, a dark-looking mixture which does not boil under a temperature of 320 degrees. When the meat is sufficiently done, a drop of water is allowed to fall in the pinhole, the steam is condensed, and at the same moment a plug of solder is dropped into the pinhole, when the tin is hermetically sealed. The canisters are allowed to remain a few days in store, when its perfect soundness is tested by the outside air forcing the can to assume a concave form; as long as this concavity exists it may be relied upon that the meat is perfectly fresh. It must be remembered that much of the objection to this tinned meat arises from a cause which the cook using it is answerable for: the meat is already cooked, and it only requires warming to be eaten, whereas cooks will recook it, and spoil it. We are glad to see that the prejudice against the meat (mainly formed by our cooks, who don't like provisions in tins, as it interferes with their perquisites and percentages from the butcher) is fast fading away, the good words the late Canon Kingsley afforded them no doubt influencing the middle classes. This fact may be estimated by the fact that the importations from Australia, which were in 1866 valued at only £321, are now nearly a million. If, however, we must eat foreign meat, let us have it in the form we are accustomed to see it in on our tables. There can be no diffi-

culty in sending a leg of mutton in a tin; let us have it in a tin then. If we see the anatomy of the joint, it will dispel all fear that we are eating offal under another name. Why do we mistrust sausages? Because anything can be stuffed into a sausage case.

Appert's process is applicable to the preservation of any surplus food, to be found either at home or in foreign parts. Why should we not have some of the turtles tinned and brought over here? They are said to swarm so in the bays of the Bonin Islands, that they quite hide the colour of the shore, and many of them are from three to four hundredweight each. Turtles' fins, kangaroos' tails, we can get in these tins at the grocers'. It is even proposed to preserve the carcasses of oxen and sheep in ice, and send them over.

Underground vermin may not promise to afford adequate material for profit, but when we come to consider the enormous number of rats to be found in our sewers and great warehouses where sugar and articles of food are stored, a different aspect is put upon the matter. In the metropolis they swarm by myriads; it is the same in all our great seaport towns. In Paris they have long since utilised these destructive creatures. We are told that there is a common pound in that city, and in this enclosure, which is surrounded with a wall, the carcasses of dead horses are placed. These are used as baits for the rats, which in the course of a single night eat them to the bones, so that nothing is left but a polished skeleton in the morning; but, as may be supposed, the rats, when there is such a plentiful supply of food, increase enormously, and the colony, every three months, has to be partially destroyed. When the battue is made, the ground is prepared in the following manner:—horizontal and cylindrical holes are bored all around, in and at the foot of the enclosing walls, the length and thickness of the rat's body. On the occasion of the battue a vast noise is made, and the rats in great fear rush into the holes; those which rush in the wall holes, which are deep enough only to hide their bodies, but letting their tails hang out, are immediately seized by those appendages, and lifted into the collecting bag of the operator; hundreds of thousands are captured on these occasions. The chief value of the rat consists in its skin and fur. Strange as it may seem, the skin of the rat is found to be vastly more delicate than that of the kid; hence it is largely used for the manufacture of so-called kid gloves. The lady, as she pulls on her Parisian glove, admiring the excellence of its

fit, is little aware that she is encasing her delicate extremities with the skin of vermin, and the dandy who lifts his hat to her, little suspects that his "beaver" is made of the skin of the same nimble rodent. We use them in this country, but it is principally to give so-called sport to dogs; abroad, however, especially in the east, they are eaten by the natives. To European ideas such flesh may seem repulsive, but when we come to consider it, we have no occasion to be so nice. A corn-fed rat is really very wholesome food. In China they are considered a great delicacy, especially rat soup, which is considered equal to ox-tail soup. The negroes, again, in the West Indies, are very fond of rats. Here they get very fat on the sugar, and are considered most delicate eating.

The value of dead horses, from the fact of their being given to the rats for the sake of clearing their bones, would seem to imply that those placed in the Paris pound are worn out or diseased. They are, of course, skinned before being handed over to their living tomb. The value of a decent horse that has died from an accident is, however, a well-understood sum. In the first place, in many countries, especially in France and Germany and Denmark, the flesh is used as food for human beings. As it is strictly herbivorous, we don't see why human beings should refuse it as an article of food.

In all sieges of large cities the horses, as a matter of course, are eaten to the last horse, and the food once tasted, we are told that the people get accustomed to it. At the siege of Paris from fifty to sixty thousand horses were consumed, and the consequence was that many persons became confirmed hippophagists; M. Decroix, in his enthusiasm on the subject, asserting that he ate the flesh of horses that had died of farcy and glanders without any ill effects, and that the taste of the meat when diseased was preferred by some people to that which was healthy! Be that as it may, however, there is no portion of a horse, diseased or not, which is incapable of being turned to account. The flesh, if not used for human food, is appreciated by cats and dogs, and when unfit for these animals it makes very valuable manure. The hide, the hair, the tendons, the blood, the intestines, the grease, the bones, the hoofs, and the old shoes are sold, the average value of a horse being 35s.—a ten-thousand-guinea racer not fetching so much as a scavenger's cart-horse which has been engaged all his life in conveying slush.

ANDREW WYNTER.

EARLY LOVE.

O UR early love was only dream !
 Still a dream too fair for earth,
 Hallowed in a faint far gleam,
 Where the fairest flowers have birth,
 Let it rest ! no stain e'er trouble
 Magic murmur, limpid bubble !

There two spirits in the calm
 Of moonlight memory may go,
 Finding pure refreshing balm,
 When life traileth wounded, slow
 Along dim ways of common dust,
 As dull lives of mortals must.

Early love, fair fount of waters,
 Ever by enchantment flowing,
 Where two snakes, her innocent daughters,
 Were wont to swim among the blowing,
 Wilding flowers thou knowest well,
 In the wood of our sweet spell !

Never Fear found out the place,
 Never eyes nor feet profane !
 Of our innocent youth and grace
 Love was born ; if born to wane,
 We will keep remembrance holy
 From the soil of care and folly.

No weariness of life made wise,
 No canker in a youngling bud,
 No lustre failing from our eyes,
 Nor ardour paling in the blood !
 Neither ever seemed less fair
 To the other playing there.

Still asleep, we drift asunder,
 Who met and loved but in a dream ;
 Nor kissing closely, woke to wonder
 Why we are not what we seem !
 Fairy bloom dies when we press
 Wings young Zephyr may caress.

Fare you well ! more might have been !
 Nay, we know more might not be !
 A moment only I may lean
 On your bosom, ere you flee,
 Ere the weary sultry day
 Hide my morning and my May !

Yet a fairy fountain glistens
 Under soft moon-lighted leaves,
 And my wistful spirit listens
 For a voice that glows and grieves,
 Breathing, when my heart would fail,
 Youth from yonder fairy vale,
 Where sings a nightingale.

RODEN NOEL.

THE NATURAL HISTORY OF ATHEISM.

II.

INGENIOUS novelties of the kind we referred to at the close of last article, whether propounded by the logician, or naturalist, by positive philosophers like Plato, or negative philosophers like David Hume, may make men stare for a day, and talk for a century, but they will never stand against Nature. "*Opinionum commenta delet dies, Naturæ judicicia confirmat*," said the great master of old Roman eloquence, and the eloquent expounder of old Roman sense. Build up your Babels of transcendental or paradoxical speculation as high as you please, if they have no root in the fundamental facts of Nature, they are only so much paper; card castles which will fall to the ground easily enough, when the wind changes and the whiff comes. And of these Babels which the perverse ingenuity of men has piled up, there is none against which the verdict of the majority and the loud protest of Nature will more certainly prevail than atheism. Theologians, no doubt sometimes with a shallow impertinence, and a presumptuous dogmatism, may have propounded many things about the character, attributes, and administrative procedure of the Supreme Reason, in protesting against which atheists may justly put in a claim for modesty and wisdom; but when they go beyond this, and instead of the arbitrary dogmas of certain ecclesiastical councils, go to war with the deep-rooted instincts of humanity, they can no more hope to maintain their ground than a little smoke and mist in some muddled locality can obscure permanently over the world the glorious sun in the firmament. For that feeling of reverential dependence of the finite derived reason on the infinite undervived reason (the *Λόγος* of John i. 1) is so rooted in all sound reasonable existence that it requires rather a perverse ingenuity to give the opposite thesis—that is, all sorts of atheism—the semblance of truth than any peculiar perspicacity to perceive that it is false. If the majority, as Aristotle argues—though there are many fools amongst them, and though they do not a few foolish and mad things occasionally—are nevertheless upon the whole entitled to have a voice in the difficult conduct of public affairs, much more are they entitled, by the primary postulates of all reasonable nature, to protest against such a hollow absurdity as atheism. For the maintenance of the atheistic theory necessarily implies one of three things: either

that effects can be produced without a cause; or that a system of reasonable effects can be produced without a reasonable cause; or that the system of effects which we call the world is essentially unreasonable, and therefore does not proceed from a reasonable source. Now of these three atheistic propositions, the negative of the first is of the nature of a postulate to all sane minds; and the wretched cavil about invariable sequence which David Hume introduced, and John Stuart Mill made fashionable for a day, will no more do away with the idea of causality in the great mass of normally constituted minds, than the assertion that the regular going up and down of a piston in a cylinder renders the supposition of a constructive reason in the person of a James Watt superfluous in order to explain the existence of a steam engine. If physical science can put its finger on nothing but a series of sequences, it merely proves that science is not philosophy, and is altogether a subordinate affair; but when philosophers, with their most acute spectacles, can see nothing in the world but an infinite series of invariable sequences, the sooner they give up their profession of wisdom the better; for it is just the invariability of the sequences which causes the reasonable mind of man to assert that there is a cause within them, or behind them, which makes the invariability possible. As to the second proposition, that a series of reasonable effects can be produced without a reasonable cause, any sane man—and the more ignorant the better for our present argument—will answer without hesitation, as Cicero did, that when a box of letters, such as are used to teach children the alphabet, shall have tumbled themselves into a well-reasoned treatise, he will believe such proposition, not sooner. The third proposition, the real stronghold of all practical atheism, though at bottom equally untenable, admits of being dressed out in some sentences of plausible pleading, and therefore must be more seriously looked at. The pious theist finds his faith on the wonderful order and beauty, and the exceeding cunning displayed in the architecture of the universe: The most obvious and ready way for the atheist to contravene this argument is to bring into the foreground the contrary of this; and to assert roundly that there is really as much disorder as order in the universe. Of course, for this form of

argumentation there are materials at hand of a very formidable look not far to fetch: Neapolitan and Icelandic volcanoes; Lisbon earthquakes; inundations of the Garonne at Toulouse, or of the Dee at Aberdeen; storms, squalls, shipwrecks, conflagrations, conspiracies, murders, massacres, madness, and all sorts of evil things which make a prominent figure in the newspapers. But, before we talk on these subjects in a perplexed or, what is more, in an inculpatory humour, let us consider calmly what our position in this vast universe really is. It is pretty much like the position of a single ant-hill in a vast forest. If you happen to be walking through some pine forest, as at Aviemore or Braemar, with your head very high, and full of fine fancies, let us imagine, you may come roughly, with your heel, booted and spurred perhaps, plump into the middle of that metropolis of straws; then what happens? the architecture of laborious weeks is destroyed in a moment, and some scores of those active little intelligences called ants squelched out of existence at a stroke. Now, suppose one of the ants who had not been squelched, with a particularly sensitive brain, and a great amount of self-importance, being able to make theories like human philosophers, should excogitate a treatise or a tissue of imaginations that might make a treatise, to the effect—My beautiful architecture has been destroyed: therefore, either there is no God, or a God who delights in mischief. What think you of this logic? If it is just, then let us all become atheists to-morrow; if it is ridiculous, let us hear nothing more of such nonsense. The real fact is, that in a vast and varied world heaving and swelling, and ramping everywhere, so to speak, with the most eager vitality, collisions and confusions of vital forces will constantly be occurring, which may produce a certain amount of discomfort to individual existences, or even blow them out altogether, but which prove no more the disorder of the universe, than a skit of a boy's squirt can put out the sun. In some parts of the west of Scotland, from the peculiar configuration of the richly varied coast-line, two opposite tides come in, and when they meet make a jabble which disturbs the serenity sometimes of nervous ladies in pleasure boats. Is there therefore no certain and regular flow in the tides, but only a universal jabble? The whole system of the world from the whirling planets in the sky to the little brown ant-hill, or the grey crusted lichen on the crag, exists in, by, and through a reasoned order only: the disorder belongs not to the exist-

ence of any one thing, but to points of occasional disturbance arising naturally out of the co-existence of many things. Who can look nakedly on such logic as this, without smiling—"I have the toothache; therefore there is no God." This is the way a clever French writer puts the absurdity of this sort of atheism. It is the product of narrowness of view, and selfishness of feeling. Let Dr. Paley's answer suffice for all such vain talkers:—"The teeth do ache sometimes, but they were manifestly not made for aching."

On the subject of EVIL generally, a great deal of impertinent stuff has been talked—not seldom by very pious people, who forget, in the first place, to tell us what Good is; and, in the second place, fail to show us how much of what is good and best in the world could possibly have been produced without the existence of many forms of what is commonly called EVIL. Sir William Hamilton, in one of his chapters, defines pleasure unhindered energy. Very well; this is a sort of pleasure which may suit some persons, or many persons. But there are others—not a few—who will say that they prefer the pleasure which arises, not from the absence, but from the presence, of hindrances. Their notion of happiness is to struggle with difficulties, not to evade them. What, it may well be asked, is the use of energy, if not to struggle with difficulty? But difficulty is only another name for what lazy people call evil; as when virtue is described as an uphill work, and vice as a prone descent. If virtue were as easy as vice, virtue would cease to be virtue; in other words, in a world where there was no evil there could be no good—at least, no good of the highest kind. If there were no ignorance, how could there be the greedy delight of opening up from ignorance into knowledge? If all men instinctively knew everything, where were the pleasant relation of teacher and taught? If there were no poverty, where were charity? If every person were equally independent and self-reliant, where would be the gracious pleasure on both sides, which arises from the support given by the strong to the weak? Where, again, would be the topping virtue of moral courage, unless the majority, at some particular critical moment, were cowards? Where would be the skill of the pilot, unless there were squalls and unexpected blasts, by which people might possibly be drowned? Where the science of a surgeon, if legs were made of stuff that could not possibly break? And if the garden, left to itself, grew not nettles and thistles, and

hawkweed and dock, but only roses and potatoes and peas, where were the work of the gardener? In fact, always and everywhere the development of energy implies the existence of that which energy must subdue, namely, evil in some shape or other. Therefore the existence of evil is not a proof that there is no God; but it is by the overcoming of evil constantly that God proves Himself to be God, and man proves himself to be God-like, when, in his subordinate sphere, he does the same. The only real evil in the world is the negative, carping spirit, the Mephistopheles of Goethe's "Faust," which, for lack of will to use the given materials in the given way, gratifies an unreasoning restlessness in blaming everything and doing nothing.

These are only a few of the considerations which might be adduced to show how unmeaning are the objections which the atheist brings against the grand and beautiful order of breathing things which we call the world. From our position the laws of order are not always equally comprehensible; but Disorder is nowhere. If it were to exist at all, the world would very soon cease to be a world; consecutive reason would dissolve into a general babblement of Bedlam; and nothing would remain but a blind weaving and unweaving of a tissue of unintelligent and unintelligible forces. So far is this, however, from being the actual state of things, that the more we penetrate into the hidden workings of Nature, the more we discover that the superficial multiplicity of outward movements is governed by a higher Unity, which pervades and controls all; and this principle is simply God, in whom, as St. Paul says, you and I and all things live and move and have their being. As in a mighty host of hundreds and thousands of men encamped on a battle-field of many miles in extent, movements are constantly taking place which are unintelligible to the private soldier in the position which he occupies, but which all shoot out from the directing mind of the great Napoleon or Moltke of the struggle as clearly and as efficiently as the divergent radiation of the sun; so, most certainly, all the multiplicity of apparently tangled movements in the living marshalling of the world, is the manifestation of that self-existent, self-energizing, all-present, all-controlling, all-moulding, reasonable Unity, whom we justly call God. Any other theory of the world is either nonentity or nonsense.

Having thus stated, in a few broad lines, the general facts of the theistic creed, and

the main foundations on which the reasonable doctrine of theism rests, I shall now attempt to lay bare the pathology of that most strange disease of the speculative faculty which we call ATHEISM. The history of error is the necessary and most instructive complement of the theory of truth.

And in endeavouring to set forth the causes of this monstrous disease of the reasoning faculty, we shall commence with the simplest conceivable, viz., such absolute feebleness or babyhood of intellect as has not yet reached to the conception of a cause at all. Travellers and anthropological writers tell us of savage tribes whose faculty of discriminating multitude has not reached beyond the number five. Some men, even of well-cultivated minds, but unused to figures, can scarcely perform a single arithmetical operation without confounding addition and subtraction; and if so, there may, of course, be creatures so imperfectly emerged from the original monkey-germ of humanity (to speak for a moment with Darwin), and so totally engrossed with putting into some sort of order the multitude of sensuous impressions now being raised into ideas, that the notion of cause has never arisen in their minds. Each individual amongst us remembers a period when curious observation and recognition of individual sensuous impressions formed the sole occupation of budding intellect; and we have only to imagine the growth of the reasoning faculties suddenly stopped in incipient boyhood, in order to realise the notion of a human being incapable of the idea of God. Stunted individuals of all kinds, and stunted races may exist just as trees trying to grow in the Western Hebrides are blasted down to the stature of gooseberry bushes. Atheists, therefore, wherever they may be the natural product of stunted and half-developed intellect, we shall set down in the lowest stage, and call them Atheists of imbecility. But, as we do not go out of our way to see oak trees not bigger than gooseberry bushes, so we need not detain ourselves with this type of intellectual incapables. It is not Atheists of this class that we are likely to meet with in the present age; and if we did meet with them, we should be much more likely to remit them summarily to some hospital of incurables, than to a thinking school where they might be gradually trained up to a comprehension of Leibnitz, and Butler, and Dr. Paley. It is not defect of intellect in ages of civilisation, but perversity, that is the main cause of Atheism.

The next type of the atheistic disease which demands notice has its origin not so much in an intellectual feebleness, as in a moral disorder of the reasonable creature. We may have met sometimes in life, or at all events in the columns of newspapers, with persons of a certain irregular, disorderly, dis-tempered habit of mind with a life and character correspondent. The career of these people is like a piece of music made up of a constant succession of jars which shakes the strings so much by unkindly vibrations, that the instrument, from the force of an unnatural strain, cracks itself into silence prematurely. Now unharmonized characters of this description are naturally indisposed, and practically incapacitated, from recognising order, design, and system in the constitution of the universe; and of course cannot see God. We find, indeed, always in the world only what we bring with us, a capacity of finding. An ass that delights in its own braying, as it is to be presumed all asses do, cannot be expected to find delight in the symphonies of Beethoven; a gambler who has been long accustomed to feed his emotional nature on the emotional stimulus afforded by the blind throw of the dice, loses the capacity of extracting pleasure from the normal exercise of reason; and a drunkard who has destroyed the tone of his stomach by the constant irritation of strong liquors, will turn away from the simplicity of Nature's most healthy beverage as from a poison. It could serve no good purpose to parade in these pages flaming examples of the terrible pranks played by disorderly characters in high places, who showed by their whole conduct that they regarded neither God nor man, but delighted in the production of sheer chaos for the triumph of a grossly selfish energy. The biography of Jack Sheppard may be a very profitable study for young thieves, but honest men will furnish the picture galleries of their brain not with such portraits. Nevertheless, it occurs to me to set down here the features of one of the most notable of those disorderly characters who lived in ancient Rome at that same epoch when the hollow Atheism of Epicurus was dressed up for a day in the garb of poetical beauty by a poet of no mean genius called Lucretius. The man I mean is Catiline. Hear how Sallust in a well-known passage describes him: "Lucius Catiline, born of a noble family, a man of great strength, both of mind and body, but of a wicked and perverse disposition. To this man, from his youth upwards, intestine broils, slaughters, rapines, and civil war were a

delight; and in these he put forth all the energy of his youth. He could boast a bodily frame capable of enduring heat and cold, hunger and watching, beyond all belief; he had a spirit daring, cunning, and full of shifts, ready alike to simulate what he was not, and to dissimulate what he was, as occasion might call. Greedy of others' property, he was lavish of his own; in passion fiery; in words copious; in wisdom scant. His unchastened ambition was constantly desiring things immoderate, incredible, and beyond human reach." This is exactly the sort of character, to whose completeness, if anything like a philosophy is to be attributed, Atheism will be that thing. For how can the man who delights in turning the social order into chaos cherish the belief that the world is a physical system, moulded and maintained by a spirit of which the essential function is to create order out of confusion, not the contrary? The man, whoever he be, that sets Rome or Paris on fire, is an Atheist, and one of the worst type; he not only denies in a speculative way the fair order of the universe, but he actually employs himself systematically in creating disorder. And what does the Roman historian say about the character of the age which produced this sort of monster? Was it remarkable for religion, for piety? Not at all. Hear the words: "When the Romans, who had grown great by labour and righteousness, at length saw all nations subdued, and the world, both sea and land, at their feet, then Fortune began to rage and to confound all things. That very people, who had found it an easy thing to endure any sort of difficulty and danger, found ease and wealth, a blessing to the wise, the source of misery and ruin. First, greed of money, and then lust of power, grew rampant: here was the fuel which fed the flame of all evils. For the greed of money and the haste to be rich, sapped the foundations of all faith, probity, and good morals: instead of the old virtues, the desire of wealth taught men insolence, harshness, the neglect of the gods, and general venality; while the love of power forced many men to be false, having one thing in their breast, and another thing on their tongue: friendships were cultivated, not from genuine love, but from some consideration, of external advantage; and men were more anxious to show a fair face than to keep a clean breast."

In this striking passage the writer shows, as by a terrible example from real life, how true the doctrine of St. Paul is, which, in that awful narration of heathen vice, in the

first chapter of the Epistle to the Romans, identifies Atheism and immorality as growing out of one common root; not, of course, meaning that all Atheists are immoral (for this, as we shall see, is contrary to the fact), but that certain epochs of gross social disorder and contempt of all moral restrictions are in their nature always atheistic. "And as they did not like to retain God in their knowledge, God gave them up to a reprobate mind, to do things which are not seemly, being filled with all unrighteousness, wickedness, avariciousness, full of envy, murder, strife, guile, evil habitude, being whisperers, slanderers, haters of God, haughty, insolent, boasters, inventors of evil things, disobedient to parents, senseless, faithless, without natural affection, merciless." For, in fact, the moment the binding power of the great cause of cosmic unity, which we justly call God, is lost sight of, the multitudinous units of human society can no more hold themselves together than the stones of an arch when the keystone is removed. Without this controlling unity to create an organic subordination of part to part, a congregation of human beings naturally resolves into a series of explosions of fitful individualism, which ends in Chaos. That which saves the cosmos at any assignable moment from reeling back into chaos is simply the unity of the self-existent divine reason, controlling the physical world in the first place by what we call laws of nature, and the moral world by what we call the principles of right conduct. Fundamentally both are one; deny the radical unity of laws of nature in the divine *Λόγος*, and you can have no reason to admit a controlling unity of reasonable plan in a well-ordered life, or a well-governed state.

So much for the outstanding extreme types of godless humanity—the atheistic incapable and the atheistic monster. Let us now descend a little into the arena of common modern life, and see what symptoms of the morbid atheistic pathology we may discover there. Now as nettles are seen growing abundantly always where human habitations have been, and every weed has its favourite soil, out of which it seems to spring spontaneously, so all the varieties of speculative and practical Atheism which we meet with in common life are weeds sprung from the rank soil of irreverence. As a man cannot eat without an appetite, though all the fruitage of Paradise be spread before him, or as a man with no love in his constitution will see a whole army of Aphrodites marched out before him without emotion, so neither

can gods expect acknowledgment from the sort of creature in whom all reverence for superior excellence is non-existent. Reverence implies a certain inferiority, and certain organs by which the inferior lays hold of the superior, and thereby achieves the pleasant feeling of elevation. But how shall a climbing plant attach itself to the lofty wall if you cut off its tendrils? So there are human souls that seem to have no tendrils, or whose tendrils have been frosted or nipped off, and thus they remain without any bond of attachment to their natural support. These are the men whom St. Paul, who knew the heathen world well, designates as *ἄθεοι*, or without God in the world (Eph. ii. 12). They drift about in a whirl of unconsecrated passion, or get trampled in the mire, or, what is even more sad, prop themselves up in various absurd ways, boasting that they can do without tendrils, and that only a weakling will cling by the old wall. This want of reverence, which is the natural soil of Atheism, may, in some cases, be congenital, like a lack of taste for music, or an incapacity of understanding a mathematical proposition. Some human beings seem shut up in a certain narrow self-sustainment; to such the recognition of anything beyond their own shell is impossible; for no person expects a lobster to come crawling up to you, and look in your face with the affectionate worship of a dog. Man is, however, naturally not only a weak creature, but a creature who, on only too many occasions, is made sharply to feel his weakness; in his normal state, therefore, he will naturally put forth feelers towards that which is above and beyond him, and that which he seeks to lay hold of for his sustainment, even in the most blind and groping way, he will justly call God. This lowest and simplest form of religion, the mere feeling of dependence on a superior Being, however inadequate, and however far from the sublime of intelligent piety, is, nevertheless, quite natural; whereas Atheism, in a mere piece of ephemeral dependency, such as the strongest man is, must always remain an absurdity and a monstrosity. We shall say, therefore, that man, being naturally a religious animal, Atheism can then only spring up when, in the individual or in society any influence arises, which nips the natural bud of reverence in the soul, and perhaps not only deprives this emotion of its healthy nourishment, but furnishes a plentiful supply of fuel to a feeling of isolated self-sustainment. Under this category falls naturally every exercise of strength, power, or

force, which may inspire the agent with a strong feeling of independence, and incline him, in the pride of the moment, stoutly to disown his dependence on any superior power. Of course in such a creature as man this sort of feeling is mere madness; for the point of a bare bodkin may give a quietus to the earth-shaking bulk of a mammoth as readily as to the minute machinery of a wren. Nevertheless, experience shows amply that this feeling of self-sufficiency, partly natural and partly formed by favourable circumstance, may grow up to extraordinary dimensions, and teach the petty personality, so intoxicated with his own imagined self-importance, to play a farce of fantastic tricks before high Heaven, which makes men laugh and angels weep. Ancient story, both sacred and profane, is full of instances of this kind; indeed, the wise Greeks, no less than the religious Hebrews, seem to have been possessed with nothing so much as with a sacred fear of the consequences that follow to poor humanity when a just self-esteem grows up into a false self-importance, and a false self-importance is exaggerated into a monstrous self-worship. Hence the frequent repetition of the wise warnings to persons in lofty positions to remember that they are mortal; and the popular image brought before the imperial absoluteness of the Eastern monarch in Herodotus,* or by Horace, in one of his familiar odes, that the lightnings of Jove love to strike the topmost towers. A man is never in greater danger than when, from whatever cause, his spirit, to use the Scripture language, is "lifted up," and in the full-blown sense of prosperous power, he forgets how he is girt round with mortal weaknesses, and conceits himself that he can even cope with the gods. "Is not this great Babylon that I have built for the honour of the kingdom, by the might of my power, and for the honour of my majesty?" says the Chaldean monarch in the Book of Daniel; and we know what happened. A man is never nearer being a beast than when he imagines himself a god. The sentiment which lies at the bottom of all such self-magnification is radically atheistic, essentially monstrous, an inversion of the order of nature—as great as if a man should say that $3 - 2$ was equal to $3 + 2$.

"Demens qui nimbos et non imitabile fulmen,
Aere et cornipodum pulsu simularat equorum."†

* History, vii. 20.
† Virgil, *Æneid*, vi. 590.

"Fool, who Jove's thunder and immortal bolt
Would ape with brass and tramp of hoofed steeds."

Now of this rebellious strength and insolent usurpation of the throne of the superior by the inferior, the lowest form, of course, is when mere animal strength, planting itself above the intellectual and moral, assumes the reins of government, either in the celestial world or the terrestrial. Of this type of Atheism the Giants and others in Greek mythology are a prominent example; the signification of which the reflective Roman lyricist saw clearly. "We know," he says in one of the most beautiful of those wise and weighty odes which commence the third book—"we know how the impious Titans, the monstrous troop, were hurled into Tartarus by the swooping bolt of Him who alone controls with righteous sway the sluggish land, the windy sea, and the dusky realms of the dead beneath the earth;" for how can it be otherwise, since everywhere in heaven and on earth—

"Vis consili expers mole ruit sua
Vim temperatam Di quoque provehunt
In majus: idem odere viro
Omne nefas animo moventes."

"Strength without counsel falls by its own weight,
But tempered force grows strong and stronger still,
By grace of gods who wisely do rebate
The insolent thought and the rebellious will."

And in the same way Homer always characterizes his Cyclops, Laestrygons, and other savage and cannibal tribes from whom the ill-starred fellow-sailors of Ulysses find cruel fate as not only inhuman and lawless, but utterly destitute of any notion of religion (*οὐδὲ θεοδύης*, *Od.* ix.). But it is the intoxication of absolute power in the government of men, more than mere brute strength, that chiefly inclines a mortal man to forget his human limitations and imagine that he can defy the gods, or, what is the same thing, set at nought the eternal constitution of things, by bowing to no superior. "I will take the city, whether Jove wills or wills not!" cried Capaneus in the pride of assault against the seven-gated Thebes; and the intoxication of self-will, and the madness of self-worship which inspired this famous old sentence, stirs even now the breast of a great Napoleon, dreaming of absorbing vast Europe, or a little Napoleon, scheming in the way of his smaller ambition, for a Rhine boundary. There is an unmistakable germ of Atheism at the root of all pride.

J. S. BLACKIE.

SOUTH AFRICA.

III.

TO revert to the question of diamond-stealing at the fields.

Let us think for a moment how facile is the theft. Peter, good Christian Kaffir, Nehemiah, excellent Basuto, Manyougoo-toosoo, pure original Kaffir, or Whatdoo-yocoolum, admirable Corrana, are at work, individually and collectively, in claim No. 555, belonging to the firm of White, Mann, & Co. All at once a small bright stone sparkles in the clay, close to the great outspread foot of Whatdoo-yocoolum or Nehe-

miah. The respected members of the firm of White, Mann, & Co. are absent. White is lunching at the Craven Club, Mann has gone to look for Namaqua partridges towards the Vaal River, the Co. is at his usual post in black letters in the mining register. Well, then, what happens? Only this. Whatdoo-yocoolum places for a moment his great toe upon the little gem, and a moment later quietly transfers the brilliant pebble into his mouth, or under his wool, where it rests safe and sound until the even-

Cattle Treking along a Mountain Road, Cape.

ing has come, and up from the vast pit stream countless negroes to scatter for the night over the dusky plain.

And now for the market where this stolen diamond finds sale—that is white. The black man does the stealing, but it is the white man who generally gets the stolen gem. Sometimes the stolen stones are not disposed of at the fields, but are taken back into the interior by the returning negro. The chief Logubula dwells far away by the water of the Limpopo. When he gave permission to fifty of his young men to visit the diamond fields as labourers, he stipulated that, in addition to every man bringing back a rifle and twelve pounds of ammunition, they were also to give him one diamond each man.

Six or eight months later, forty-eight men trudge homeward along the weary road which leads to the Limpopo; a bucket falling from the reef edge of the pit, settled for this world the account of No. 49; 50 had his thick head split in a row with the Amakosae Kaffirs, so forty-eight go back to their northern kraals, carrying forty-eight muskets, a goodly store of ammunition, some red rugs, and forty-eight bright little stones carefully hidden away.

When they arrive at their destination they hand over the forty-eight diamonds to the chief Logubula, who drops them into a little earthen vessel in which many others already lie snugly; and every now and again he takes the earthen cup between his hands,

and shakes it until the stones rattle and glisten, and then he says, "See! this is easy to carry. In a day I can walk a long way with this. Not so with lands or rivers, I cannot carry them away, and when the white man comes to take my land, as come he will, he will get my land; but then I take up this little earthen bowl, which will by that time be full of shining stones, and I will walk away with more in my hands than land, or river, or cattle." And the chief grins as he thus develops his little programme, and rattles his treasure-bowl again and again. All this showing clearly enough that Logubula is wise in his generation with the wisdom of the white man.

Diamond-stealing is on the increase. The negroes are yearly becoming more dishonest. It is a sad fact, but a true one. What produces this result?

Unquestionably it is contact with civilisation. It is one thing to tell this black man that it is wrong to steal; it is another thing to let him see, day after day, white men buying stolen stones; Jews and Christians, and men who are neither Jews nor Christians, prowling round the pit, offering money at random for the

morning's find. But the negro learns other secrets than diamond-stealing at the great pit of Colesberg. Kaffir from the Kei, Amafonda from the St. John's, Zulu from the Umfolosi, Swasi from the Maputa, Matabilli from the Limpopo, Basuto, Bechuana, Corrana, or Bushman, all learn here the great fact that they are brothers in labour, confederates in servitude; the old jealousies of race begin to disappear before this bond of a common sympathy, and at last before the black races of South Africa stands out the patent truth that they are opposite in interest, object, desire, in every line of life and thought to the white man who has come among them, and that the old dream of a time drawing near, in which the black and white races would share together their rival inheritances of possession and knowledge, is only destined to

develop a reality in which knowledge and possession rest with one race.

And in this we touch the real obstacle to what is called the civilisation of wild or savage races. We often marvel why the conversion of the heathen becomes more difficult as time goes on, and yet a moment's reflection will suffice to show us that the reason of the thing is patent enough.

When the wild man or the negro gives up his Great Spirit, his fetish, or his idol, and adopts the teaching of Christianity, he also adopts the social customs and the social standards of what we call civilisation. Where does he find himself in that new scale? At the very lowest point, somewhere between the beggar and the pauper.

In nine cases out of ten we have taken, or bought, or tricked his land from him; we

have killed or chased away the wild animals that roamed over it; we have shouldered him out into the remote mountains, or regions unfitted for our present wants. He learns our knowledge after a time; but that is only as a light held out to show him how miserable is the position he has accepted — the position of a Christian pariah.

View of River in Mountain District, Cape.

He has been told, a hundred times, that this new religion meant brotherly love; that before God colour vanished, and race was not known; and if he has believed the teaching, how bitter must be the sense of disappointment with which he learns the real nature of the rôle he has accepted in the new creed and social state; how startling the discovery that this beautiful theory of the white man's love and brotherhood and charity to all men, means in the hard logic of fact the refusal of a night's shelter under the same roof to him; means the actual existence of a barrier between him and the white race, more fatally opposed to fusion, more hostile to reciprocity of thought, mutual friendship, or commonest tie of fellowship, than that which lies between civilised man and the dumb dog that follows him.

Long years ago the red man of North America realised this fact that civilisation meant to him servitude or death. He chose the latter. America, said to contain at the period of its discovery fourteen million Indians, to-day does not hold four hundred thousand.

But with the African it is different; he does not die out before us. Nay, if we give him the common condition of room, he multiplies amazingly; he multiplies, but he does not come to the surface. He is always beneath, deeper, thicker, denser, it may be, but always below. It is a curious problem, this of the African, and the more we study it the more difficult it grows. He will not die, he will not disappear. We will not have him as an equal; we cannot have him as a slave. What then is to be the outcome? Time will answer, as he always answers; and, meanwhile, this big pit at Kimberly promises to hasten the answer.

We said before that the black toilers in the pit carried away with them when they returned to their homes arms and ammunition, in addition to a certain amount of dangerous knowledge. We will now give a significant fact. More than 300,000 stand of arms, chiefly rifles, have passed from the hands of white traders at the diamond fields, into possession of South African negroes, during the last seven years. "A man has worked for me," a trader has said to us, "until he has had money enough to get a rifle, and the regulated amount of ammunition, six pounds or thereabouts; he has then gone away to take home his rifle and powder, and after a lapse of a couple of months he has come back again to work for more ammunition." It is not too much to suppose that more than 300,000 natives have been armed and equipped for war at the diamond fields.

What is it all for? Ah! that is the question. Some will tell you that it is for the chase; others for war between tribe and tribe; others, again, see in what it is, in all human probability, a preparation for war against the common enemy, the white man. The struggle will be as hopeless as it ever has been. Snider and Martini-Henry and Whitworth have quadrupled the weight with which the white man "crushes" these efforts of the savage to keep him out; but all the same there will be much bloodshed and misery yet experienced ere the white line of conquest is pushed home to the Limpopo.

Now let us say one word about the diamond itself ere we quit the "field" on which it is found. We cannot believe for a moment that this pit at Kimberly, or the

two or three other spots at Du Toit's Pan and De Beers, are the only diamond mines in this great plateau of South Africa; many others must exist.

Nothing marked these rich places of the earth; the mimosas grew their thorny stems there as elsewhere; sheep grazed on the stunted "karoo" bush; springbok filed in long peaceful lines across the plain. All at once the glistening stones are found, and in seven years ten millions' worth of diamonds are unearthed.

It is not yet ten years since the first diamonds were found on the banks of the Vaal River. They were water-washed stones of a lustre far surpassing those now discovered in the big pits at Kimberly; but they were few and far between, and the river banks where they were found were soon worked out. It was evident that they had been washed in bygone times from some spot higher up the river, and deposited on the outer slopes of gravel banks formed by eddies in some vast volume of running water. This brings us naturally to the question of what was originally the aspect of this plateau. It was without doubt a mighty lake. At some age in the earth's history all this red plain, this grass-covered rolling table-land, now so dry, and at times so arid, lay deep beneath an inland sea.

If a traveller lands on any portion of the coast of South Africa, from the tropic to the Cape of Good Hope, and journeys inland from the sea, he soon comes to a range of mountains. These mountains run nearly parallel to the coast, and are at varying distances from it; sometimes thirty, sometimes one hundred and thirty miles from it.

Ascending this mountain range, and gaining the top, one stands on the rim of the extinct lake; the ground falls again, but only falls to a third of the original extent. This inner plateau is in fact the lake-bed of South Africa. What has become of the enormous volume of water that must once have filled this vast basin? The lower lands, between the rim and the sea, tell that plainly enough; the dry bed of the lake tells it too. The waters rolled away in mighty floods. The lake bottom was raised from beneath, or the rim was worn down; but at any rate the great flood poured forth and swept before it, not the mere rock and debris of earth, but the surface of the earth itself—the hills and plains that lay before it.

South Africa is a land of table-topped hills. These curious flat wall-like mountains with hard sandstone sides are the wrecks

left by this mighty flood, they are the island fortresses that resisted the rush of water; around them the softer rock, and looser earth was carried away; their iron sides stood the fierce rush of the waves, and at last, when the era of erosion had passed, they remained to still carry on their smooth summits, sometimes set three thousand feet above what is to-day the surface of the country, the level of the land in bygone ages. But, before the waters were pushed over the rim of the vast lake mighty changes had taken place beneath its waves. The fires of the earth had broken forth, and through the soft silts of cycles, and through the layers of sand and mud and sub-marine vegetation, the molten trap had forced its way in many fiery fissures.

In all human probability it was during these struggles between water above and fire beneath that the diamonds were formed in the funnel-shaped bed, where they are found to-day at Kimberly. That they came floating from beneath is evident enough. Here and there, scattered through the pit, are found detached masses of rock, these boulders are called in the language of the mine "floating reefs;" on the tops of such rocks diamonds are scarcely ever found; at the sides, sometimes; beneath, they often lie. As bubbles seek the surface, so in bygone ages might these carbonic bubbles have floated from the furnace, raging beneath through the funnel opening under the lake, where, kept down by the weight above, they crystallized under conditions we cannot define.

This explanation of that curious question, "How are diamonds formed?" was first put forth by one who has long watched with observant eye in South Africa the story told by the rocks to man.*

That these three or four earth-openings, under the bed of the extinct lake, were not the only ones, is evident enough, and it is impossible to believe that there are not many other such mines scattered over the plateau, which, as time goes on, will be found as rich, perhaps richer in these bright carbon crystals than even the big pit of New Rush. Karoo and mimosa cover them to-day.

A word now as to the quality of stones found in South Africa.

The diamonds first found along the Vaal river were of exceeding brilliancy, fully equal in lustre to the finest stones of Golconda, or Brazil; but in the pits of Kimberly, De Beers, and Du Toit's Pan they are nearly all "off-coloured," or yellow. In

the one case they have been washed by the river, and exposed to the action of air at some period of the world. In the other, they lie deep in the bowels of the earth, and first see light when the digger's pick disturbs their rest. Many of them crack and flaw when the light first comes to them.

And now as to the value of the diamond, and its probable future.

It is scarcely possible that the gem can retain the place which it has so long held, if these South African diggings are to continue. Large brilliants must become common. Fifty, eighty, one hundred, even two and three hundred, carat stones have been unearthed in these dry diggings. We have already stated our opinion that many other pits will be found in the vast dry bed of this extinct lake; and then fashion, easily frightened at profusion, will take alarm, and the emerald of Central Asia, or the ruby of upper Burmah, will perhaps supplant the long-throned supremacy of the easier found diamond.

Turning from the Diamond Field itself to the effects of such discoveries upon the social and political aspect of South Africa, we find much food for reflection.

Every branch of trade, commerce, and agriculture has derived fresh life and new impulse from these fields. The land, deemed a desert twenty years ago, has become of great value. A farm in the Orange Free State means a great tract of land of not less than six thousand acres in extent. It is not too much to say that land in this Dutch Republic is worth to-day as many pounds per acre as it was worth pence five-and-twenty years ago. Six thousand acres form a single farm; but some men are in possession of five and six such farms in the state, and once it was our lot to ride over a Free State farm of two hundred and sixty thousand acres. What a possession! It lies on the top of the lower range of the Drakensberg, over the plains of Newcastle, some six or seven thousand feet above the sea level.

Grand beyond description is such a possession. Hill, vale, plain, and river, all lie within its limits; and from the rising of the sun to his setting the traveller canters his tireless Cape horse between the beacons of this single ownership.

If we in England would wish to realise the effect of this increase in the value of estate in the Orange Free State, let us suppose a country as large as England changing in the actual value of its soil from one penny per acre to ten shillings in the short space of twenty years; and yet the value of the land gives

* The Secretary for Native Affairs in Natal, the Hon. T. Shepstone, C.M.G.

but a faint idea of the value of its products. These are, in many instances, at famine prices; all vegetables, dairy produce, etc., are worth three and four times what they cost in London. It is a subject of jest to-day in South Africa, because the historian of the Tudors drew a moral in Bloemfontein—the Orange Free State Capital—from the price of cauliflowers sold in the markets; yet that one straw was a better index of the difference between demand and supply in South Africa than ten thousand theories.

It is only a little while since that we witnessed the sale of a large waggon-load of cauliflowers in the Kimberly market at 2s. 6d. each vegetable. The load contained about two thousand cauliflowers.

There is no fitter soil or finer climate in the world for the production of these things than that of this Free State and Griqualand. Give it water, and it will grow anything, and the water is there in abundance if man will only "turn it on." Before the discovery of diamonds and gold, all these things were drugs in the markets; suddenly a vast demand arose for them; Europe sent its steamships to supply what it could, tinned things of all sorts, but the Africans did little, the more adventurous ones flocked to the Fields, the lazy ones sat idle at home.

Diamonds were to be gathered in garden or dairy far away from those wonderful Fields, where men so often lost their little all; but few thought of so gathering them; people said the demand had suddenly come for all these things, and would as suddenly die out, and meantime they did nothing, and famine prices became the rule in a land ever ready to yield to man "the full fruits of his labour."

It has been said of South Africa that it is a land of samples, and of nothing more; that its cotton, coffee, sugar, and wheat, everything save its wool, is excellent, but limited; that it can produce the first specimens for an exhibition, but the last for a continuous export trade. All this is true; but all this only proves what we said before, that the people will not work.

If the land produced from itself wheat or sugar as the sheep produce wool, wheat and sugar would find their way to Europe; but at present wheat is brought from Australia, potatoes, butter, and vegetables are carried from England.

Take the bill of lading of any steamer sailing away from South Africa. The cargo consists of wool, a few bales of antelope and ox hides, a few packages of ostrich

feathers and parcels of diamonds and gold. It is scarcely too much to say that with the exception of wine, the manufactures of South Africa are confined to two articles—Cape carts and Cape waggons, both excellent in their way, but not enough to make even the semblance of an industry.

We do not mean to assert that idleness is universal in South Africa. All professional and commercial life goes on there as elsewhere; but, out in the country people do not till the land as they till it in America or in Australia, and it is but too evident that the occupations of husbandry are not congenial to the habits of the Dutch farmer in any shape or form.

Hitherto, in these sketches of South Africa, we have said but little upon a subject usually associated in men's minds with the upper plateaux of which we have been treating—the wild animals which have become so familiar to us in past descriptions of hunters and travellers. Well, the last few years have made sad havoc in these once-crowded ranks. The larger game has "treked" into the remote north. The lion, the eland, the koodoo, the rhinoceros, the quagga, and the buffalo, are all gone from the Orange Free State; the more remote Transvaal holds them still. In the dry wastes of the Kalahari Desert, in the feverish swamps of Zululand, and the valleys of the Limbombo Mountains, these grand specimens of wild nature roam and range. The elephant is further off still—all save one great herd preserved in the dense forests of George, nigh the southern extreme of the continent. Natal, once the favourite home of every animal, from the lordliest lion to the tiniest antelope, is to-day nearly denuded of game.

But if the larger animals have retreated into the wilds, the antelopes are numerous enough still in the Free State and in the more settled portions of the Transvaal. In the great grassy plains of the middle "Veldt" hundreds of blesbok and springbok gallop and gambol under the bright sun of winter, but they too are fast disappearing. Six years ago they existed in numbers impossible to reckon; they devoured such quantities of grass that the Boers killed them as people kill vermin.

It is said that a few years since a member of the "Volksraad" wished to preserve the game from the ruthless destruction of the farmers in the north and east of the State; but he was told that if he did carry a measure to that effect, another law would be proposed by the eastern farmers to pro-

fect the locusts of the west from destruction. Myriads of quaggas were ruthlessly hunted down; springbok and blessingbok, and wildebeestes, were shot and stabbed and galloped over precipices, where they lay smashed and heaped over one another, until at length the land was cleared of them.

A few wild ostriches are still to be found in Natal and in the Free State. As usual, the law has stepped in to save when there is hardly anything left for saving; but the domestic ostrich has now become a regular institution in South Africa, and thousands of pounds have been invested in "ostrich farming." It is probable that there are far more ostriches in sight of Cape Town today than when the Dutch first raised, on the shores of Table Bay, the old castle, and the lions roared so loudly round it at night that the quaint chronicler of the time tells us, "We thought that they [the lions] would have taken the post by storm last night."

It may appear strange how it came to pass that this great quantity of wild animals should have been able to exist upon the plateau of South Africa, in the midst of the

natives who dwelt there fifty years ago; but the answer is easily given. Around each native tribe there lay a wide cordon of uninhabited country. To pass from the country of the Matabili to the country of the Zulus or the Bushmen, one had to traverse vast unoccupied tracts, where game multiplied with incredible rapidity.

The conditions of savage life are the same all the world over, and have been in all times and in all places. We read that in ancient Gaul the septa or tribes dwelt far apart from each other. Contact meant war, and it was only by putting space between them, that the periods of peace, necessary for the rude work of agriculture, which they carried on, could be maintained.

Thus, too, has it been with the numerous warring races of North America, and we find that in the far west and north-west of that great continent, as well as upon the vast plains and plateaux of South Africa, these neutral grounds became the homes of countless wild animals, which roamed the wastes in a glorious freedom from the common enemy, nowhere else found on earth.

W. F. BUTLER.

THOUGHTS ON NURSING AS A PROFESSION FOR GENTLEWOMEN.

OF all the employments open to gentlewomen there is none more suitable to them than nursing, and although many people have grave objections to women entering the medical profession, who would object to women making *nursing* a profession? It is closely allied with the medical profession, equally honourable, useful, and, if properly taken up, scientific.

In some forms of disease, the requisite minuteness and completeness of observation can only be attained by a more or less constant presence in the sick chamber. Is it not evident, then, that Nature has assigned to woman this share in the task, and that, in performing it, her place can be in no way inferior to that of those to whom the other portion of the work is given?

Miss Nightingale says, "Sickness is everywhere. Death is everywhere. But hardly anywhere is the training necessary to teach women to relieve sickness, to delay death. We consider a long education and discipline necessary to train our medical man; we consider hardly any training at all necessary for our nurse, although, how often does our medical man himself tell us, 'I

can do nothing for you unless your nurse will carry out what I say!' Of how many a rich patient I have said, 'Would that I could send him (or her) into hospital.' Few know, except medical men in the largest practice, how many rich lives, as well as poor ones, are lost for want of nursing, even among those who can command every want under the sun that money can purchase."

The generality of people think that any woman can nurse, and trust for help, when their need comes, to the untaught, love-prompted care of wife, sister, or daughter. How many lives are yearly lost by that trust it would be cruel to compute; and for each life lost we may count another almost equally sacrificed; broken down by the combination of severe labour and trying emotions—labour of course threefold harder to the untrained labourer, emotion from which the professional nurse would be almost as free as the physician, a freedom which will improve, not impair, the goodness of the nursing.

What you want in the sick-room, to quote a well-known medical authority, "is a calm, steady discipline, existing but unfelt; the patient, cool control which a stranger is far

more likely to exercise than a relation; and the experience of illness to note changes, and call for aid at needed times, as well as to recognise symptoms and correctly report them." The latter capacity it is simply impossible that any but a trained nurse should possess in any high degree.

The patient whose wife, sisters, or daughters, unwearied by the fatigue of nursing, bring with them into the sick room fresh minds, a fresh moral atmosphere, and that cheerfulness which is impossible when spirit and body alike are over-taxed, really gets the best that it is their power to give.

Over and over again have I heard from wives and mothers, the terrible confession, "If I had known all that I do now, my dear ones would not have died." That is, they died of untrained nursing, and the untrained nurse, their wife or mother, knows it!

Sometimes the jealous affection of those who fancy that nursing is one of the natural instincts of womanhood, and that ignorance of nursing is a reproach, has had disastrous consequences.

I will give an instance of this, which was told me by the medical man in charge of the case.

A little girl, the only child of a lady, became very ill. The doctor called in to attend her said that "she must have an experienced nurse from London at once," and telegraphed to an institution with which he was acquainted to send them one. The nurse arrived, was put in charge of the patient, and day by day a marked improvement was perceptible, until one evening the doctor cheerfully announced, "he could now say there were fair grounds for hoping the child might recover."

Before leaving, he ordered leeches to be applied, directing the nurse how much blood was to be taken from the patient, and the great care required that at a certain stage the bleeding should be stopped.

The nurse promised to obey his directions, applied the leeches, and on their removal the warm linseed poultice ordered. This done, the mother—who had never left the room—insisted that the nurse should leave her patient and go to bed. The nurse refused to do so until the poultice was removed and the bleeding stopped. Upon which the mother indignantly asked "whether she supposed that *she* wasn't capable of doing such a thing as that for her child?" adding, that she "insisted upon the nurse's leaving the room," which accordingly the nurse did.

Early on the following morning the doctor

entered the child's room, expecting to find a marked improvement towards recovery.

He found the child dying!

The nurse was not in the room, and when he asked for her, the mother replied, "Nurse can't tell you anything about the child, for I sent her to bed, and have nursed Elsie myself." Upon hearing this, the doctor turned down the bed-clothes, and finding everything saturated with blood, exclaimed, "Didn't you know then how to remove a poultice, and stop leech bites from bleeding?"

"Of course I did," she replied, but the child fell into such a sweet sleep after nurse left the room that I was afraid to disturb her—for you know, Dr. —, how much you have wished she should have a good night's rest."

The doctor couldn't tell her she had killed her child. He sent for the nurse and gave her a severe reprimand for neglect of duty, adding, "that her work there and the life of her patient were alike at an end."

If this nurse had fully understood the responsibility of her position, she would not have deserted her post at the bidding of any one but the medical man under whose orders she was to act. Had she received a professional training—so high that none but a thoroughly well-educated woman could have passed through it—then I think there is little doubt that no one would have dreamt of interfering with her duties, any more than they would interfere with the prescription of the medical man in attendance.

Training, then—an education in the duties of her profession as complete in regard to those duties as the training of men in their vocations—is the only thing that can qualify a woman to take charge of the lives of the sick; can make her truly and honestly a professional nurse.

The idea that "any woman can nurse" is as silly as that other, by which most families employing a governess have suffered at one time or another, that all women who have "had an education" can teach.

It is not so long ago, as already to be forgotten, the anxiety felt by the whole nation for the health and recovery of the Prince of Wales, but did any of the thousands realise, who watched for the daily bulletins of his health, that, humanly speaking, he must have died, had it not been for the unwearied and devoted attention of skilled medical attendants? Ever at the bedside to watch and note the slightest change in the disease, and prompt in administering the right remedies at the very instant they were required,

the disease was fought and conquered. But what private person, however rich, can hope that any one would watch by his bedside with the skill of the physician and nurse combined?

The poor in one respect are better off than the rich, for their worst cases are sent to the hospitals, where, in addition to thoroughly trained hospital nurses, they have the advantage of medically trained "dressers" always at hand to note all the various forms that disease presents.

Few have yet realised that, in addition to the technical and moral training and discipline which must be acquired in a well-organized hospital, a greater amount of theoretical knowledge is absolutely indispensable for a nurse who goes out to "private cases," and that, for this vocation, a higher education and a higher grade of women are required. In addition to the ordinary hospital training—even though that be the best of its kind—it is essential that the private nurse should have received almost a medical education, if she is to act in any sense as *aide* to the medical man, whose patient she has been put in charge of. For she is in a very different position from the hospital sister or nurse. The latter has a staff of medical men to appeal to, at a moment's notice. Her patients are visited by the house-surgeon or physician at least three times in every twenty-four hours, in addition to the morning visit of the medical *chef* or "professor" of her ward. In private nursing, the nurse is *alone*, and has to act more or less on her own responsibility, rarely seeing the doctor above once in the twenty-four hours. Who, that has ever watched the progress of disease (more particularly in a certain class of fevers) does not know the many changes that may occur in even twelve hours? With a well-trained and skilful nurse at hand, no change could ever pass unnoticed, and her professional knowledge would enable her to know the right remedy to apply at the right moment, and in all probability life would be saved, which otherwise would have been lost. Nor is it possible to over-estimate the use of such a trained body of women, in time of war.

In my fever-lazareth before Metz,* the medical *chef* had not time to visit carefully all the men, but twice in the day he would come, and each time ask me to point out the cases that seemed to need particular

care and attention. On leaving, he would say, "Remember, Sister, that the lives of these men depend more upon your nursing and care than upon anything I can do for them. If you observe—such and such symptoms, you must change the medicine immediately. If you find any man's pulse going down rapidly, you may give . . . at your own discretion. *You* will see changes in the disease, which no one who is not watching by the bedside ever could see." Any difficulty I could always mention to him at his visit, and however hurried he might be, he would always explain and instruct me what to do, so far as time allowed. I often wondered whether such hurried instructions would have been of the slightest use, had I not been "trained" more than any of the Sisters in our station. And yet I daily felt how much more useful I could have been had I known more, and how great my ignorance really was. I learnt *then* how much a nurse requires to know when she must act on her own responsibility in every emergency that may arise.

If nurses could be as carefully and scientifically trained for their future work as medical men are for their vocation, it would be impossible to over-estimate the advantages to the world at large of such a body of women among us.

To quote one of the medical authorities of the day, "With a class of trained women, ever at the bedside, skilled in observing with the utmost accuracy, and without disturbance to the patient, all those delicate variations which disease presents, medical knowledge itself might be expected to enter upon a new development—new subjects and methods of observation could hardly fail to develop themselves."

How is it, then, that among the thousands of well educated and intelligent English gentlewomen, so few can be found to offer themselves for this work? Every one knows, however, how few employments there are open to gentlewomen. An officer or clergyman can bring his sons up to earn their own living in the world, with the hope of their leading useful lives to the community at large, perhaps of rising to honour and renown. But what provision can he make for his daughters? As children, they have probably received a far less thorough and expensive education than the sons, on the assumption that it will be of no use to them when they are grown up. The father dies, and with him probably all the little means the family possessed. Untrained and half-educated, his daughters must go out into the

* In this hospital the loss was only three per cent., while in others the mortality was enormous. One cause that contributed to this was that the *chef* was the only medical man who followed the so-called English method of unlimited fresh air and feeding.

world to earn their own living as they best can. And the only way open to them is to become companions or governesses.

This is neither the time nor place to speak of the heart-breaking disappointments that fall to the lot of most who are looking out for a situation. We are all acquainted with the long columns in the papers, filled with advertisements of "Governesses," and we all know how few of those who advertise their ability to teach others have ever been properly taught themselves, or have ever been taught how to teach, and the dignity of such a profession for those properly qualified.

To make nursing equal, as a profession, to the medical, a more comprehensive education and training is necessary than is required for a hospital nurse or sister; and such an education and training would be necessary as would secure to its members the social position and material rewards that belong and are generally given to those who combine a scientific education with a useful calling. The professor of the theory and practice of medicine at Montreal (Dr. Howard) says, "Such an art would imply, in my view, a liberal preliminary education at least equal to that now required of the medical student, assigning, however, a first place to natural science, and a lower one to the classics. And second, a professional education extending over three full years, and embracing the following scheme of subjects:—Anatomy, physiology, chemistry, materia medica, pharmacy, dietetics, hygiene, and clinical instruction in nursing the sick and wounded, in dressing wounds and applying splints, &c.; such nurses to receive a diploma upon examination, entitling them to practise the art of nursing. Such a body of trained nurses would supply the greatest want we have as physicians, and would open up a career of usefulness and honourable employment to our sisters, who would then be not only the helpmates, but the *complementa* of the medical profession."

Other members of the medical profession have said the same, although few, perhaps, have written as fully on the subject as the author of "Thoughts on Health." He confidently anticipates the time when every gentleman of limited income, who is seeking to provide a profession for his sons, will strive quite as earnestly "to establish" his daughters, not in the ordinary sense of the word—by marriage—but by providing them with such an education and training, that they may look forward with quiet confidence "to having a home of their own."

When these women married, they would marry simply because they felt that love and esteem which all wives should feel for their husbands, and not because they were alone in the world, and wanted a home, dreading sickness or age coming upon them unprepared.

In the last place, the interests of charity would be promoted; for no restraint would be placed on the benevolent efforts of those ladies or sisters of religious communities who prefer to act as nurses without being paid, and to spend their lives, so far as they can, in doing good. For why should their number or zeal be diminished?

But every one must acknowledge that those things which rest for their doing on charity alone are seldom thoroughly well done. To how large an extent medical men give their labour gratuitously to the poor, long after their doing so has ceased to be of any possible advantage to themselves, is partly known to all. Must not the sick poor be benefited in like way by the presence among them of a large number of kind-hearted ladies, filled with a professional zeal for good nursing for its own sake, and as being that whereon their own renown and prosperity depend? Would they be more apt to turn a deaf ear to the call of suffering than their male *confrères* have proved themselves to be? Their position would give them an influence with the sick poor, that the half-educated nurse or midwife who now tends them cannot hope to acquire; nor do I think it would be possible to overrate the services of such an educated body of nurses among us, in the *prevention* of disease alone.

Are there none among those who may have read these "Thoughts on Nursing," able and willing to train themselves for this profession? The demand for even the most ordinary of half-trained, half-educated women, is far greater than the supply.

We hear of ladies undertaking work that could be better done by others. Why will they not give themselves to this work, and give the time, money, and brains necessary to prepare themselves fitly for the most honourable of all careers open to women?

If the judgment, tact, discretion, and good breeding supposed to characterize a gentleman were supplemented by the thoroughness and endurance born of routine, and the mechanical habits of study which it is proposed they should adopt, *then* we should have a class of nurses, second to none in the world; and "nursing" will indeed have become a "profession," in the highest sense of the word.

FLORENCE S. LEES.

WHAT SHE CAME THROUGH.

BY THE AUTHOR OF "LADY BELL," ETC.

CHAPTER IX.—PLEASANCE HATTON AND THE
BLENNERHASSETS, LIZZIE AND CLEM, NEXT
THE BROWN COW.

ULLY six years after-
wards Pleas-
ance Hatton
was walking
in a June
evening up
to the vil-
lage—set on a
height—
of Saxford.
It had been a
grand sunset,

leaving a golden glow behind, while picked out against, and irradiated by the glow, stood the old irregular line of humbly substantial yet tumble-down white houses, with blossoms of red and white roses, orange tiger lilies, and marine-blue larkspur in the gardens, and with honeysuckle in flower over the stone porch of the little thatch-roofed, flint-built church, in whose graveyard lay the dust of Anne Hatton.

Saxford was at its best, both as to season and hour. The great, far-stretching meadows bore a wealth of waving grass starred with field-flowers; the very borders of the ditches were blooming with brook-lime, irises, queen of the meadow, and marsh-mallows. The rich religious light was so much in itself that it prevented the bareness of the landscape from being conspicuous; the light seemed not out of keeping with the wide flat as it flooded it, and descended low over it, without being broken save by the arms of the windmills and the masts of the barges, and lent a sober grandeur to the space and freedom of the place.

Everything was still save the revolving arms of the late windmill taking advantage

of the evening breeze, and the slow gliding sails of a barge, and both white and brown sails blushed ruddy under the sunset. The cattle and horses, which were in droves and herds, lay or stood in living patches in the pastures. Hardly a bird broke the silence, save when darting sand-martins uttered shrill screeches, or a flock of curlews from the direction of Cheam gave forth their mournful cries. In the morning the air resounded with the carols of larks, but save for larks this was not a region of singing-birds, and it seemed as if the rich, mellow notes of thrush and blackbird, belonging by right to woodland-coverts and tree-set hedgerows, would not have suited the scene which Pleasance had grown to love. She took in every one of its features—from its wistful blue distances to its airs from every wind of heaven, and its homely charms of grass and field-flowers, which were trampled under the feet of cattle—and laid them up in her heart.

As to Pleasance herself, she was now a young woman in the full promise of her womanhood, if she had not yet attained its fulfilment. She was dressed not like the women of Saxford, who were still showing their ignorance and their ambition by outrageous imitations in the tawdriest and coarsest materials of such prevailing fashions of crinolines and chignons as had descended from imperial courts and noble drawing-rooms, through city parlours and town factories, even to peasants' cottages and country-fields. But Pleasance knew better. Besides having renounced for herself, if not the vanities of the world, certainly the vanities of station, she was aware that if such senseless and ungraceful encumbrances could ever be redeemed by fine setting, and have a place of their own, they were simply irredeemable where they had no outward advantages to mask their uncouthness. Instead of aping those whom she had chosen should become her social superiors, she was earnest and deliberate in marking her difference from them, except in those essentials of a lady which are open to all, and in which, by burning her books, she would have sinned against her womanhood.

Not a lady in the land could be more delicately clean and neat than Pleasance, for since her altered circumstances a pathetic recollection of Anne's example and precepts

clung to her, and influenced her much more than they had done when Anne had lived, and lived together with Pleasance; and now that her standard was simplified for her, and that she had grown up to it, though she soiled her hands with labour, she could remove the soil a world more easily than some of her sisters could remove the soil of self-indulgence and dissipation.

Pleasance wore such a calicot gown as Anne had bought for their mourning, but it was of a peach-lilac colour—like the blossom of the lilac-bush—a fast colour, which stood frequent washing. The gown was made as Mrs. Balls had taught Pleasance to make her gowns, but not according to Mrs. Balls hankering after the fashion. It had a plain, rather tight skirt, short enough to leave Pleasance's feet—quite shapely feet, though encased in thick-soled leather boots, such as boys wear—room to walk with perfect freedom.

She wore a white apron, but as it was evening, and Pleasance had a morning (albeit a working) gown, and an afternoon or evening wear, as duly assumed as any duchess changes her cachmere for her *crêpe-de-chine*, Pleasance being no anchorite, and having no austere desire to disfigure herself, but on the contrary, a perfectly natural, and, in her case, artistic longing to make herself look as well as possible, had substituted for her heavy shrouding-linen apron, with its bib, a little round white apron of soft muslin.

Her gown was finished by a collar and cuffs of the same muslin, but she wore no brooch, mock or real. Her collar as well as cuffs was fastened by white buttons.

Her hair—a deep black brown—was still drawn back from the forehead, against which it formed a wavy, dusky line, the duskiness softened here and there only, where the soft young hair showed upon the skin, with a hazel-nut tint, and was plaited into close coils behind. Partly covering the coils, and coming down in a little peak in front, was a little veritable muslin-cap, with a narrow-frilled, lace-edged border, which did not outline the face, but after approaching the forehead ran back in two full flowing white lines above the ears. The cap had no strings and no ribands, and was fastened on the head by no gilded or silvered skewers, but by invisible pins. The cap itself, which, if Pleasance wore it as a badge of interior station, she somehow felt was also a badge of womanhood, was all but invisible on the present occasion, for it was under a sun-bonnet

big enough to shade the face without impeding the view.

Pleasance's hands were bare and brown, but they were neither large nor rough, as she held in one of them a tuft of the ox-eyed daisy which she had pulled in her walk. In this dress, in which an ordinary woman would have been insignificant, Pleasance was a tall, handsome young woman, with an unconscious stateliness in her simplicity.

The life not only in the country, but engaged in manual labour, always wholesome, and sometimes in open air, never too much for her strength so as to crush or to brutalise her, had done something for both mind and body, something which no other life would have been likely to effect.

Had she continued at school, and with free command of books, shut out from all save school life, she would have almost certainly become studious and bookish, with rounding shoulders and hollowing chest, and the tendency to sallowness in her complexion fully developed.

As it was, she had grown up in comparative abstinence so far as books were concerned; in solitude, yet in close contact with life in its most practical aspects; original and independent without being eccentric in mind; straight and firm in body, while losing her angularity, with freely-expanded chest and well-rounded limbs. Her muddy complexion had cleared into a pale brown, which, when the red blood tinged it, kindled into soft, yet pure and noble warmth, like that of the sunset, and before which all pink and white hues paled and grew sickly.

Her mouth had lost its wavering, undecided lines, and grown steady in its serenity. The contour of her face was still a fine oval, with the curve of the chin perfect. But her hazel-grey eyes—and here was the defect of her face—had not in their depth and clearness escaped from the shortsightedness which had threatened them when she was a girl of thirteen.

Pleasance had grown up unquestionably short-sighted, and that she might not go through the world at a great disadvantage, had, on one of her occasional visits to Cheam with Mrs. Balls, bought a pair of spectacles, put them on with great satisfaction, and frequently wore them. Thus Pleasance's eyes were often to be seen looking out of windows.

Strange to say, though the act of putting on spectacles would seem to be a simple act, arguing even an absence of personal vanity

in the doer, it was viewed by Pleasance's village companions with greater disfavour than any act of hers from the time of her coming to Saxford. It was regarded as very conceited, and a decided attempt, while pretending fellowship, to establish a difference between herself and the other girls.

Who ever saw a girl at a cheese-tub, or cooking a dinner, or hoeing in the fields, with spectacles? An old needle-woman, whose sight was failing, and who had to earn her daily bread by fine stitching, or a grandfather who was sufficiently well off to have leisure in his age, and was scholarly enough to read a chapter in his Bible, might wear spectacles, but that was quite a different thing.

"But you might have them if you wanted them?" represented Pleasance. "Spectacles are not expensive, and I am sure they are not ornamental, only useful."

The notion that there was assumption in wearing spectacles remained as rooted as ever, in spite of all that Pleasance could say to the contrary, and she had to sustain many a jeer from the plain-spoken natives of Saxford, and to make up her mind to bear the nickname of "Madam," in a place given to nicknames. She had to pay the penalty of having specially offended against public opinion, as well as to take her share of the conversational buffets which were always freely bestowed in Saxford.

But Pleasance had so far ceased to be an outsider that she could not only go and come unmolested, but was treated to a measure of cordiality as one of the villagers themselves. She was no longer stared at and jostled. She was hailed freely, and asked—if she happened to wear a new gown or hat, or had worn one on the last Sunday at church—where she had bought it and what it had cost. In addition, she was applied to with some confidence to recommend this or that younger girl to a place among Mrs. Balls's workers, or to get Mrs. Balls to contribute her aid to this or that case of sickness and consequent poverty, among the improvident inhabitants. Pleasance was bound, on this occasion, to pay a visit to a girl who was regarded, according to the loose criterion of the villagers, as her great friend, and who was indeed Pleasance's nearest approach to a friend, during those six past years, after she had been robbed of her second self in her sister Anne.

This friend was one of the Blennerhassets—the smith's family—in their own way personages in the village. But Lizzie and her

brother Clem formed exceptions to the other Blennerhassets, and instead of being looked up to and envied, had been marked out for pity, which passed easily into contempt and ridicule.

The friendship between Pleasance and Lizzie Blennerhasset owed its commencement largely to Lizzie's cousin Long Dick, who worked at the Manor, and who gave it as his opinion that Pleasance Hatton was "a rare good and clever mawther." The words sunk into the heart of Lizzie, who had worshipped her cousin Dick ever since he had saved her life, at the time her lameness was incurred, when he, a mere "wambling" boy of sixteen, at the risk of his own life, carried her, a child, down the ladder, which gave way under his tread, and out of the old smithy, after it had caught fire and was burning down to the bare walls.

Lizzie had watched and followed Pleasance. Lizzie had even tried to soften her own uncouth manners, and to acquire something of the other girl's gentle bearing, in order to suit the alliance.

Pleasance was touched and flattered, by having inadvertently won an adherent, to whom she was an object of desire, and set herself to be good to Lizzie Blennerhasset, and to return her homage by acts of kindness.

As the intercourse extended over years, during which Lizzie was induced to cultivate Pleasance's acquaintance more and more sedulously, a share of Pleasance's refinement extended insensibly to Lizzie, cut off as she was from many occupations and amusements of the other girls, who undervalued her for her infirmity; and while this refinement tended in turn to disqualify Lizzie from mixing on such an equality as she could command with her sisters and immediate neighbours, it necessarily drew her more closely to Pleasance.

Pleasance was tolerably certain of finding Lizzie alone, or at most with her brother Clem for her companion in the smithy house at this hour, since Long Dick, Lizzie's cousin and idol, was too shy as yet, too conscious of his own deficiencies and her advantages not to hold himself aloof from such encounters with Pleasance as were not provoked by a fellowship in labour at the Manor, where Dick was at last engaged as principal man.

Indeed, if one wanted to seek the inhabitants of Saxford after working hours, the place *not* to find them was in their own houses, for never was there such sociality or such absence of privacy as existed in the village.

All day long, and particularly towards evening, everybody about the place entered into his or her neighbour's doorway—the door always standing conveniently wide open, or on the latch—and penetrating into the centre of the household gods, took up a post there, to recount his or her day's adventures, or to hear the neighbour's without a thought of intrusion. In addition great unpremeditated gatherings were constantly occurring at different houses.

No amount of wrangling which was prevalent, nothing save the most deadly feuds, interfered with this monadic, yet gregarious custom. The natives spent their time like the Athenians of old—if not in hearing some new thing, in discussing with unwearied relish what was already familiar to them. The utter absence of any other mental aliment than gossip supplied, was, doubtless, at the bottom of the gregariousness.

One result of this easy, promiscuous, and never-ending system of visiting, in the women's case, was complete idleness unless from compulsory work, and from play of the tongue, which produced an amount of slatternliness that attempts at Sunday finery served to intermit, not to repair.

The Blennerhassetts were particularly well situated for that chief business of Saxford, to retail and animadvert on the events of the day. The smithy, which was in itself a village centre, stood next the village inn and alehouse, the Brown Cow, another centre. Perhaps affected by situation, smith Blennerhasset and his wife formed respective heads in the male and female lines of gadding and gossip, who were never to be seen at the forge or the fireside, unless urgent necessity or the presence of neighbours called for their attendance. They did not need to stray very far, as in the bar of the Brown Cow they generally met with all which husband and wife required. This did not imply that either gave himself or herself up to the liquors to be found there. Smith Blennerhasset could take his glass like a man, or a smith, and for the good of the house was wont to have ale or gin and water before him—drinks which did not act powerfully on his squat, stalwart frame. But Mrs. Blennerhasset really lived and thrived on gossip and bad tea alone. She was as sober a woman in other respects as her friend Mrs. Morse, who was not the typical, hearty hostess, fit pendant to host Morse, a rattling, rollicking giant of a man, but a little quiet, sly woman, with an insatiable maw for the gossip she imbibed, but never seemed to

disgorge, and who took pride in her innocence and ignorance of any riot which occurred under her very nose at the bar of the Brown Cow.

Kitty and Nancy Blennerhasset, with Lizzie, all the daughters of the house who remained unmarried, and who worked—now at the Manor in the milk season—now on the fields in the spring and early summer—and now assisted Mrs. Morse in the depth of the winter, had their own circle of visiting, beginning and ending, like their father's and mother's, in the stir and agreeable variety of the Brown Cow.

Pleasance entered by an open door into the front kitchen of the smithy, with its evidences of sluttish plenty. She found, as usual, the substantial remnants of the two last meals, with the dust-heaped hearth, and the littered chairs, left to the guardianship of the purring cat, that rose and rubbed itself against Pleasance with a friendly greeting. She knew where to seek Lizzie in a garret room, which served at once as her bed-chamber and work-room. Lizzie, who had grown up in a state of idleness, bemoaning her misfortune in being lame and sickly, and wagging her tongue with the strongest, had in the end, after qualifying herself by three months' apprenticeship at Cheam, taken to dress-making, fortified in the application which the effort required by the greater independence secured to her from her earnings, and above all by the approbation of her cousin, Long Dick, and her friend Pleasance.

Lizzie, sitting on the single chair at the little table, laden with her very ordinary materials and patterns, and with the flood of mellow light from the skylight above her, pouring down upon her and her surroundings, was still as pale, freckled, and lame as when Pleasance first made her acquaintance; but she was no longer either in dirt or disorder, or flaunting in cheap finery like her sisters.

Her calicot gown was almost as neat as Pleasance's, while it was gayer, and a great deal smarter in flounces and frills, which served as the young dressmaker's sign and certificate to her public of the village.

Lizzie was wanting entirely in the blowzy comeliness of her sisters, and was the poor little creature they thought her, yet she was not without some womanly charm. She had blue eyes like her cousin Dick's, while her hair was several shades fairer than his, and was carefully dressed over rolls—a less objectionable fashion for women of

every degree, than the deforming chignon—to display its soft luxuriance. Her smile was the only other attraction which she possessed, but it took one by surprise, and it was for Lizzie's special friends so beseechingly sweet, that its sweetness seemed to enter into the very soul, and take it captive in a kind of lowly triumph.

"I'm main glad to see you, Pleasance," said Lizzie, rising to give her friend her chair.

"Keep your seat, Lizzie," said Pleasance.

But no, Lizzie said she was tired and stiff with sitting in that chair, and if Pleasance would take it, she would hoist herself on the table, and find a rest in a change of position.

"Come out for a stroll, Lizzie, after I have told you what Mrs. Balls says," said Pleasance, alluding to a piece of patronage which Mrs. Balls was bestowing upon the dress-maker, "the air and the sky are so fine to-night."

"Thankee, Pleasance, I can't, I 'a to finish this gown for our Kitty, as she would be in a fine way if it were not done by Saturday night, since she pays me honest out of her wages; not but I might lay it aside, for an hour, but I 'a promised Clem to be ready to give him his supper, he's been all the road to Cheam since father left the smithy early, for strings to serve to scrape upon, and I 'almost think Dick may come here afore he looks in at the beanfeast. Hindshaw's, the Cheam brewer's, men are holding a beanfeast next door, and the rest, and all the village are helping at it."

Pleasance had heard the sounds of more than ordinary joviality, which, even as Lizzie spoke, were borne in at the windows in snatches of song, stamps of feet, and bursts of cheering.

"Mrs. Morse axed me to step in when my work was done," said Lizzie; "but I should be of no use and get knocked about in a throng, and I had promised Clem. I 'almost thought, too, Dick might be here—not to say you, Pleasance, for I judged Mrs. Balls had given me all the directions when I were up. Has she altered her mind about the riband bindin', or what?"

Pleasance delivered her errand, and sat and chatted with Lizzie hoisted on the table, pushing her idle needle through her yellow hair as if to sharpen it.

Pleasance told Lizzie how many cheeses had been made that day, and during the previous week; how one cow had suddenly ceased to give milk, with Mrs. Balls's concern for the disaster and the efforts to remedy

it; and how Pleasance's earliest brood of chickens were fit for the poulterer's cart from Cheam—to her sorrow, while her last had come out to an egg, and she had recovered one little weak bird which she had found all but dead after yesterday's rain. Lizzie told Pleasance of this beanfeast, which threatened to be riotous; of little Luke Simms who had been lost, and all the village turned up by his distracted mother, when the boy had only crept on board a barge, up near the Broad, and taken a trip in it as far as Applethorpe and back again; and about Mrs. Grayling's pig which had been killed that morning, and was fatter than the Blennerhasset's, though Lizzie could hardly believe it.

Pleasance was interested in it, pig and all. Humanity accommodates itself to its surroundings. In other circumstances she might have been engrossed with an Eton boy's voyage in his water lily of a punt, or the worthy death of a gallant racer; and so she was not inconsistently taken up with little Luke Simms's trip, and Mrs. Grayling's pig displaying after death its honourable layers of fat. There are some, and these not the worst specimens of humanity, whose sympathies are wide and unailing for all in which humanity is concerned.

"I'm afeard Dick ain't comin,' after all," remarked Lizzie, innocently and rather consolately, after a pause. "I hope he ain't taken with any of them Cheam women that comes to the feast—a bold, low set, wuss'n our village gals. I could not abide that, Pleasance, I could bear to give him up to the likes of you, but not to they."

Pleasance laughed without either emotion or offence. "Dick will please himself, and I would leave him to do it, if I were you, Lizzie. But here comes Clem."

A heavy foot sounded below, and a call of "Liz, I be comed home," summoned the girls down-stairs.

Clem Blennerhasset, three years Lizzie's junior, was a thick-set lad of seventeen, and had a round, red face marked with small-pox.

It was not for any physical flaw that Clem, like Lizzie, was disparaged and set aside by his family and their associates, to the degree that he had voluntarily absented himself from the beanfeast. It was for what they regarded as a mental infirmity.

Clem worked with his father in the smithy, and did a good day's work, appearing at the end of it with his face, bare neck, and arms grimy as those of a young cyclops. But he

had cleaned himself this afternoon for his long walk to and from Cheam, and showed himself a heavy, good-humoured-looking lad in fresh moleskins.

"Have you got what you wanted, Clem?" inquired Pleasance, "will you be able for practice now?"

"Wool, I hope so," answered the lad, drawing a long breath, "I was kinder cleaned-out, and left like the 'talian chap, to go at it on one string."

"Go at your wittles just now, Clem," his sister recommended him, as she cleared a place for him, placed a huge lump of Suffolk dumpling before him, and flanked it with a mug of ale, "for I must get back to my seam, and not lose what light's left."

Clem went at his victuals with the heartiness of a hungry country lad, who holds his knife and fork close to the haft, and plunges them horizontally into his food, while he does not trouble himself with the ceremony of wiping off the froth which a deep draught of the ale leaves on his thirsty lips.

But when the lad had finished his meal, in place of stretching his tired limbs and falling fast asleep, or winding up with the consolation of a pipe, like his elders, he stamped up stairs after the girls and retired to a den of his own in the other end of the loft, whence sundry squeakings and squealings issued for the next ten minutes.

At the end of the time, Clem marched into Lizzie's room with a battered fiddle beneath his chin, a bow in his right hand, a roll of yellow music in his left. His whole physiognomy was now transmogrified and illuminated, so that whereas he had been before but a country bumpkin, he was now a born artist, with the fire of art flushing his chubby cheeks, and glimmering in his small eyes, and the nobility of art dignifying his boyish, rustic person.

Clem Blennerhasset had first given indication of a soul for music by whistling in emulation of the larks and of his cousin Dick, as soon as Clem could speak. Very little notice was taken of these indications till Mr. Fennel, the vicar, whose wife was musical, substituted boys for young women in the choir of the little church, and caught Clem as a great prize.

The next stage in the development of Clem's gift was his having spent some years of his boyhood with a grandfather in Cheam, where there were such things and persons as fiddles and fiddlers. These the boy ran after day and night, not caring that the irresistible inclination took him into strange com-

pany, and exposed him to frequent punishment for his vagabond tastes. He was so full of one object, that he did not incur worse punishment by contamination from the associations into which he was thrown.

At last some poorest prodigal of a musician who had drifted to Cheam, and who had yet something of the true musician and old maestro in him, recognised and welcomed the fellow-feeling in the boy, and gave him some lessons, which Clem never forgot after he was recalled to Saxford and put to blow smith's instead of organ bellows, and to grow up to his father's craft.

The Cheam musician had ended his first course of lessons by generously presenting Clem with his worst violin, which the boy had borne home with him as a priceless treasure.

Every moment of spare time Clement devoted to this violin, and every penny he could call his own he hoarded for strings, or to enable him when he was older to start for Cheam on his holidays and half-holidays, to get fresh instructions from his master, who died at last, to Clem's great if not disinterested regret, which was much softened by the widow's giving her late husband's pupil a pile of old copied music which she did not know how to dispose of elsewhere.

After the violin, this music was Clem's wealth. He could read it, though he could barely read a printed book, and it opened to him a wide range of knowledge and delight since the dead musician's repertoire included scraps, not only of Balfe's, Bishop's, and Arne's, but of great foreign musicians of every shade and school, from Spohr to Rossini, and from Haydn to the old murdered Italian Stradella.

In the glorious world which the crooked scores of the faded and torn manuscript was opening up to Clem Blennerhasset, he was a new creature, eager, enthusiastic, inspired; while in the old world of the smith's shop, and the village life of Saxford, he was but a lout of a boy, so much the duller, even, than other scarcely educated country boys, in that he was subject to absent-mindedness.

In this pursuit of music Clem had been largely, and since the death of his musical patron, nearly altogether, without sympathy. His own people and his fellow-villagers regarded his musical propensities as a craze for which his father, the smith, who was somewhat of a bully, would have unquestionably tried "a hiding" as an effectual remedy, had the lad ever provoked him by neglecting his proper business in the smithy. But young Clem was a docile, though not a bright, ap-

"WHAT SHE CAME THROUGH."

prentice, and promised with his hereditary strength to prove a fair workman, so that his father submitted to swallow the mortification of having his only son cat-witted.

Even Lizzie, who had no musical ear, though she could listen complacently to her cousin Dick's singing at the pitch of his manly voice, "My young man the waggoner," and "Nancy is a-comin'," had no more sympathy with Clem than the common cause which the two made together as stay-at-homes and aliens in the family.

Pleasance Hatton had more knowledge and still more love for music. She had helped Clem when he had only borrowed sheets to play from, by copying the score for him, she counted it a treat to hear him play the airs, some of which brought back to her echoes from the pianos in Miss Cayley's school, and Miss Smith's appreciation of Clementi. Still her spark of genius was not kindled at the flame of music.

These were purely accidental and arbitrary circumstances which made a trio of Clem and Lizzie Blennerhasset and Pleasance Hatton; notwithstanding, the union existed, and was doing its work in moulding the lad and the girls, and their respective lives.

Clem did not despise Pleasance and Lizzie as an audience. He played with a will, not only his "Last Rose of Summer," and "Robin Adair," but more ambitious violin parts in symphonies and concertos, the combined and perfect whole of which the lad had never heard, and was not likely ever to hear.

"If you would play tunes as a body could dance to, Clem," said Lizzie, "you might carry in your fiddle to the Cow, and have the whole feast waiting on your bow."

"Not as I knows on," answered Clem. "Didn't I go for to play at one of their harvest homes, and ouldn't the tramp of their hoofs 'a drowned a big drum? wernt my fiddle all but broke to splinters in a row atween Bill Morse and Neddy Nobs?"

"Play to us, Clem," said Pleasance, "play your favourites, I know they match with the midsummer's night that poets and musicians have been so fond of; if we can only enter into the music ignorantly, at least we'll not stamp the sound out of hearing, or risk its source either in your brains or your fiddle."

Clem's airs, though she had no name for them, lingered in Pleasance's ears and blended with the evening breeze as she walked home safely, before the beanfeast was over, when the rose of the sky had died out from faint salmon colour and buff to pale amber, and when its blue was deepening into purple.

CHAPTER X.—LONG DICK AND HIS SUIT.

LONG DICK—a giant, as his name implied—was an orphan nephew of the Blennerhassetts who had been reared in the smith's house, where, however, he had never held the orphan child's conventionally cuffed and forlorn position. This fact did not proceed so much from exceptional virtue on the part of the smith and his wife, as from the circumstance that Dick's physical strength, always highly prized by a handicraftsman, and his independence of character had been early developed. He had never been a burden in his kinsman's house; he had soon asserted his right to a mind of his own, and without having inherited his uncle's bullying propensities, he had not been slow to indicate that he did not understand being bullied, and would not only take his own way if it were proved a right way, but would help other people to get theirs, and prevent the world in general from being put upon.

Dick had not stuck to his uncle's elbow, or evinced any inclination to succeed him in the smithy, which should be little Clem's place; and the lad's sturdy self-reliance and indifference to his friends' patronage had no doubt impressed them and contributed to their respect for him.

Dick had gone about to shape "a way of doing," the poor man's expression for a career, to suit himself, and if he had been a little erratic in the shaping, and had tried more than one way, it was not from fickleness and failure, but from a love of mastering all.

Dick had worked with his uncle in the smithy, he had been a waggoner, he had even taken a trip in one of the Cheam ships to Gothenburg; but his love of the country, in the land and its products, had finally caused him to aim at being an under-bailiff, and he had so far succeeded in his aim, that he was in his twenty-seventh year head man under Squire Lockwood's bailiff at the Manor.

Dick was six feet high, and broad in proportion, with hair verging on tawiness, blue eyes, massive features, including a massive jaw, and an arm and hand that would go as far towards felling an ox as any mere man's arm and hand would go, to accomplishing that often-quoted feat.

The one dream of Dick Blennerhasset's life, since he had worked at the Manor, was Pleasance Hatton. He might have had his fancy tickled previously by "Mrs. Ball's gal," who had been partly born and reared among gentlefolks, though she had descended to his rank, and who was like, and yet so unlike,

the other girls; but the close contact occasioned by his work on the Manor, where, although he did not take his meals in Mrs. Balls's kitchen, he was constantly seeing Pleasance in the court and garden and yard, or having her under his charge when she took a turn with the other young women at the spring and early-summer work in the fields, did his business thoroughly.

It was not that Dick thought himself a match for Pleasance; she might descend as she chose, and work under him every day of her life; love sharpened his eyes, and lent him imagination to see that there were invisible barriers between him and Pleasance, which, for all her simple pleasantness and apparent unconsciousness of these barriers, he would never probably be able to surmount.

Long Dick's love for Pleasance was a half-despairing love, very nearly as desperate as his cousin Lizzie's love for him, and in its despair it did not always have a beneficial effect on his character.

For the most part it did him good. It supplied him in his somewhat stolid materialism with an ideal which he could at least dimly see, and crave after. It taught him the grand lesson of humility, as he approached Pleasance with reverence in his devotion. It forced on him, though it might be to his chagrin and disgust, a sense of his own defects. It induced him to labour painfully at self-improvement, whether it were in what went sorely against the grain, by his becoming a "scholar" at the vicar's night-school; or whether the self-improvement took a form far less antipathetic to Long Dick—namely, the employing of his powers in the best market, and the husbanding the disposal of his wages, so that he might become early a man of substance in his rank.

But these efforts required some amount of hope to stimulate and brace the combatant; and sometimes Dick lost hope altogether. Then, as by a reaction, he would plunge into the excesses of his kind, and be far more left to himself and wilder than he would have been had he never known Pleasance Hatton.

But these ugly episodes in Dick's history were never regarded by himself and his class as instances of grave moral declension, or as permanent stains on his character. It was only Long Dick "gone on the spree," like most of his neighbours, and it is to be feared the large proportion of them liked him the better for the fellow-weakness implied in the delinquency.

The whole of Saxford and the Manor were perfectly aware of Long Dick's being "uncommon sweet on Pleasance Hatton up at the Manor." For that matter few deeds were done, or feelings that could be comprehended were entertained, in Saxford, which remained hidden and secret. Saxford knew more than the bare existence of Long Dick's passion; it was tolerably acquainted with every phase of it, and strongly inclined to jeer at the bashfulness which came over Dick, and at the faint heart with which he approached his fair lady.

Pleasance Hatton might be very well, but the Saxford folk took her at her word when they reckoned her as one of themselves, and why should not she be made up to by a proper young man, the best workman at more than one craft? Long Dick was as good a wielder of the hammer as smith Blennerhasset. He was equally good as a wagoner, as a drawer of a furrow, as a builder of a stack, and judge and keeper of cattle. He was one who could walk, or run, or whistle, or box for his own hand or for a wager with any man in the parish. Long Dick was a man who was the pride and the credit of the place, and had nothing against him except that my lady's self, "madam," no less, had it in her power to cause him to forget himself, and send him on the rove for a day or a couple of days at a time. If that were not a feather in her cap, it was no beam in his eye.

What was known to all, was, without fail, known to Pleasance, and, however she might take it, she agreed so far with her neighbours that there was no degradation in Long Dick's suit.

Becoming one of the people had been no make-believe or play on Pleasance's part. She had adopted Long Dick's grade with such a will that she did not desire to remember any other. In weighing the virtues and vices of that class with those of other classes, she could not, after the blow and the recoil that had parted her from her own old antecedents, think that the working class stood lowest in the list that was to be judged. At least it was her class now; other classes in rejecting her and Anne by Mrs. Wyndham, and in condemning Anne to die, had cast her out for ever. They were not for her. She would work with working people. She would share their homely lives, and be one in their ranks—which after a little trouble to prove to the members that one was no interloper or spy, were open to all, gentle or rude, saint or sinner—till death should prepare for her new conditions of being.

It has been shown more than once in this and in other generations, that one effect of high civilisation, with its confining network of conflicting obligations, and its artificial atmosphere, has been the passionate rebound by which, here and there, one man among thousands of men has, without any morbid taste for vice, torn the bonds, cast behind him the forms, and gone back to cleave as for dear

life to society in its primitive elements—involving the necessity of labour and hardship, and the strange, simple company which poverty implies.

Women who have never been disturbed in their cradles of luxury have felt this longing also, else the story of the young Princess of Saxony, who pined for the vagrancy of treading on foot the bridge in her father's

Page 177.

capital along with burgher and peasant, lies.

To an innocent woman who had suffered keenly from the effects of a wrong inflicted by worldly hands, humble, unsophisticated life in its breadth and its strong issues could offer a powerful attraction.

The plain simple bonds which attached Pleasance to her chosen fellows, the sense

that she was not only one of them, but was of use to her brothers and sisters, were dear to her. She shrank with an unconquerable repugnance from a more complicated and artificial life. She would now have difficulty in complying with laws she might condemn and scorn. She could not any longer be at home, and could confer no benefit in a state of society with regard to which she

would feel herself a burden, and from which there might be such another violent disruption as had broken Anne's heart and cost her life.

"Those who are down need fear no fall," and chiming in with the wise humility of the song, was Pleasance's proud calculation of the worth of humanity itself, in which the humanity was the question, and all adjuncts of rank and position were but accidents of circumstance.

With these views, any notion that she was not really one with her neighbours, that—after all the persistent determination with which she had sought to grow up or down to, and accommodate herself to them, in every right essential—she still remained isolated from them, was a distress to Pleasance. She would strive against the conviction—from which, however, she could not always and altogether escape, so that a sense of loneliness in the present, and a fear of greater loneliness in the future, occasionally weighed upon her in midst of her contentment, and haunted her with dread.

But Pleasance was no mock working woman to be aggrieved and affronted by Long Dick's wooing. It did not take her by storm; it did not carry her away. Still it would be altogether untrue to say that it did not touch her, while she regarded it and her suitor half with a thrill of maidenly agitation, half with the intent sympathetic interest which belonged to her character.

Pleasance had been slenderly endowed with worldliness to begin with. She had been shaken free from her old world, and the studies, which were all that she retained of it, save what was part of herself, were in those regions of higher wisdom and romance in which worldliness has little place. There is the highest sense, but there is very little worldliness in the writings of Shakespeare and Sir Walter Scott, while it sounds like profanation to say that there is no worldliness in the Bible.

These were what were left of Pleasance's teachers, and one of the effects which they had upon her was to make her incapable of contracting the least soil of the vulgar and sordid worldliness of such people as the Blennerhassetts and Morses, or even Mrs. Balls.

Pleasance was as entirely separated from her early associations as was the knight, Sir Hildebrand, shut up by the machinations of Kühleborn on the island, with the fisherman and his wife and the changeling Undine. She was keenly susceptible to many of Long Dick's gifts and good qualities.

Like most clever women, in whose cleverness imagination preponderates, she had even an exaggerated admiration of physical strength and beauty. She valued Dick Blennerhasset for his fine person with its native power, the nobility of which no clumsiness or absence of drawing-room or dancing-school graces could deprive him; and she never valued Dick's handsome athletic figure more than when he was hard at work, tossing hay, or breaking horses, or washing sheep. She did miss something, while she was angry with herself for missing it, when Dick was in his Sunday clothes, with a straw in his mouth, or twirling a flower in his fingers, but when hard at work he was a model of a fine-looking strong man. She liked what she knew of the independence of Dick's career, she liked his industry and honesty.

There was common ground between them in their love of country things, and, above all, of animals; perhaps there was still more that was common than what was foreign between them. Pleasance liked the good feeling, and even the delicacy, of Dick's bearing to Lizzie Blennerhasset; nay, she liked Dick's bearing towards herself. She was affected by the respectful distance at which he stood from her, by the lowliness of his offerings of young birds, and of flower seeds for her garden brought from Cheam, of nuts of his own gathering, and trout of his own catching. She could value his struggles and sacrifices on her account, his forsaking the bar of the Brown Cow for the vicar's schoolroom, his sitting on a bench in a half-lit room among lads most of them half-a-dozen years younger than himself, striving, till the sweat-drops stood on his forehead, to make a "scholar" of himself for her sake. This was something like love, even more like it than the free-handed fellow's pinching and saving in order to make a purse which should enable him to offer her a better house-place and a greater assurance of comfort than was the portion of most village girls when they wedded.

As for the sorry falls, which were the great inconsistencies of Dick, with which the heavy doubt of his ever winning Pleasance had a good deal to do, she not only looked on them piteously, they cut her to the heart. It was not that she agreed with the villagers in regarding "going on the spree" as a necessity, or at most as a slight offence, in an unmarried man of Dick's years. Pleasance was too godly, too innately and ineradicably refined for that, though she

might inadvertently have stooped a little to the village standard of virtue; but she could not be the person to condemn Dick for sins into which she herself, however unwittingly, led him. She did not believe that these sins were a part of Dick—big, handsome, kindly Dick—who had been on the whole so gentle with Lizzie Blennerhasset. These were spots on the sun, flaws in the jewel, but they were no integral part of Dick.

Once, when Pleasance was in the village, she saw Dick stagger out of the Brown Cow. His gait, the firmness of which she had compared to that of a rock, was wavering and awry. His healthy face had an unhealthy flush, his observant eyes were clouded, a straw hat with a green riband which he was accustomed to wear, poised lightly, and which became him well, was falling back from his head. His speech was loud and bragging, like his uncle's, but it also had a thick stutter, which the smith rarely acquired, except on specially convivial occasions.

The time was afternoon, and some of the village boys appearing miraculously from their herding or their apprentice trades the moment a diversion called them, were gathering round Dick, without any sense of the shame of the deed, to make sport, of the man who was on ordinary occasions their hero. Women were peeping, or coming openly to their doors to look at and to loudly discuss him, men were wagging their heads, some of them thrusting their tongues into their cheeks at a sight which made Pleasance, as she thought of Samson a sport for the Philistines, rush into the first house and hide herself, careless of what people might think or say of her flight.

But Pleasance did not thus escape from the sight of Long Dick in his helplessness and humiliation. Returning sadly to the Manor, she encountered him again on the road, this time stretched on the bank perilously near a ditch, sleeping heavily, with Lizzie Blennerhasset, who had limped out after him, sitting crying beside him.

Pleasance sat down and cried to bear her friend company. Her heart was smitten rather with a passion of compassion than with righteous anger. She helped Lizzie to raise his head from the damp grass, she wiped with softness the earth-stains from his hair. She waited till he was fit to be roused, and then she accompanied Lizzie, who was giving him a poor little arm, to support him, that he might walk with sheepish unsteadiness back to the village, and only left them within sight of the first house.

While Pleasance accompanied the two, a dim recollection returned to her of a fragment of gossip which she had heard during the first day's cheese-making, when the girls of Saxford had spoken of one of their number, Car Reeves, spending the hours of her fair day in a neighbouring village, sitting in an alehouse by Harry Owen, trying to get him out; and a pathetic sense of the girl's dog-like fidelity came over her.

Pleasance had been seen lending help, along with Lizzie Blennerhasset, to get Long Dick to a place of shelter, where he might recover from his enslavement, but no one took any notice of her at the moment or pursued her with ridicule then. Something of the sacred privilege which attended bringing home a man on his shield, in the days of old world warfare, was accorded by the rude villagers of Saxford to the young woman who cared for Long Dick, in the weakness of his error.

Only afterwards, there were sundry sly and sardonic comments, and even open advices to Long Dick, to pluck up a spirit boldly, and go in for his prize, since there was no doubt in which direction the wind blew.

But Long Dick did not need sorrow and shame for his outbreak and exposure, to convince him that he knew better. "It weren't as if she liked me in that way," he said, "then you might be kinder right. Women, the best on them have big enough hearts to take the chaps that please their fancy, if they are on the square at all, faults and all, and make the best or the wust on en. I a'most think that the women d' be the fonder the more they 'a to pity and forget, since they forget theirselves fust. But, bless you, she don't like me as that comes to. I'm none so up in luck, even if I deserved it, she's only full of pity as she's full of friendliness to all the world, because she cannot hinder it. I'm her frien' surely, and she could not see me in the muck without being heart sorry for my plight, and seeking to give me a haul up. There's no laughter of devils or scorn of Pharisees in the likes of her. But that d' be all."

Mrs. Balls was on Long Dick's side. The last six or seven years, which had changed Pleasance from girl to woman, had begun to tell severely on her elderly kinswoman. Mrs. Balls felt her activity leaving her, and age, with its heaviness and incapacity, advancing on her with rapid strides.

The good woman was concerned for Pleasance's welfare, after she herself was past work. Lawyer Lockword might pension her

for old service's sake, but she could not expect that he would keep her on at the Manor, when she had ceased to be of use. With her place filled by another, and she and Pleasance removed to some cottage, with its cabbage garden, in the village, Pleasance's position would be very different, though she could not be brought to see it and take it to heart, and though she would have all Mrs. Balls's savings in addition to her own little bit of money, which Mrs. Balls's squire, Lawyer Lockwood, had said would come due when Pleasance was of age.

On the other hand, if Pleasance gave Long Dick the encouragement, which was all he required, and the two become lovers, and then man and wife, Pleasance, and Mrs. Balls with her, would have a strong arm to work for them and protect them in the first place; and who knew but that Long Dick, who was head man already, might rise to be whole bailiff, and then Mrs. Dick might take Mrs. Balls's place, and the old home and the old pleasant sense of rule and patronage still be Mrs. Balls's.

Mrs. Balls was conscious, though she could not have expressed her consciousness, that the conclusion would be consistent with poetical justice, that it would be a return such as she was entitled to expect from her young cousin, Pleasance Hatton.

At the same time, Mrs. Balls had no idea of forcing Pleasance's inclinations; for that matter here was no call to force inclinations. Long Dick was the finest young fellow, far or near, and if he forgot himself now and then and got tight, or even had a fight with his drunken companions, why, he was only neighbour-like, and no worse than his betters—than Squire Lockwood's son, for instance, who came over with his cricketing club, and got roaring drunk at the Brown Cow.

And did not everybody, Mrs. Blennerhasset and Mrs. Morse, say "Long Dick were main soft, and a clean fool about Pleasance?" It was because he was so foolish that he had not always the heart to keep himself straight, because he had got it into his head that his girl would not look at him in the light that he wished.

But if Pleasance would only draw him on, and let him see that she cared for him, and had a mind to be his wife, why then she could twist him round her finger, and make twice a man of him, who was a man already; and she would live to buy all Saxford at one end and to sell it at the other; and Mrs. Balls would go bail that he would not take a glass too much above once a year at the

Applethorpe fair, or at the Cheam races, or when there was some extraordinary celebration of events—family or otherwise—at the Brown Cow, during the entire course of his married life.

"It would be so com'fable, Pleasance," urged Mrs. Balls, "if we was all together here, though I ain't favourable to marriage allers. I 'a shown that when I 'a refused offers a-many on them in my days, so you need not look sarcy, now that you 'a one of your own to pick or let fall. Still a man about a house as belongs to it, is cheery."

"And what would Lizzie Blennerhasset say?" said Pleasance.

"What 'ould Lizzie Blennerhasset say?" repeated Mrs. Balls indignantly, "let her say. What right 'a she to say? a silly of a gal as well as a poor little crooked stick, ever to cast eyes on her cousin, and think that because he pulled her out ou the fire, he had not done enough for her, but mun stoop to look at she for his wife—set her up! It is imperence, as well as March madness, in Lizzie Blennerhasset, of which her wely own mother is ashamed. Long Dick will never have nowt to say to Lizzie Blennerhasset, though she wait till she d' be ninety-nine, and you give him the go-by to-morrow. You need not make that your excuse, Pleasance. You had better think on it, afore it be too late."

"Does a girl want to think before she will let a man keep company with her?" said Pleasance, using the current phrase of the place.

"Why 'ouldn't she?" inquired Mrs. Balls, a little fretfully, "better think soon nor late."

"Ay, better, Mrs. Balls, but better is not always what happens according to nature, and so there must be something to be said on the other side too."

"Now, you're high flyin', Pleasance, and where be the wings to the fore for folk to foller? That comes on them books. You've been a good gal as has set your back to the wall, and made the best on your hups and downs; but if yer 'ould 'a given up them books with the rest, it 'ould 'a been a sight better for you, and all as has to do with you."

Pleasance wondered if it would have been better, could she have been always and altogether like the others. And sometimes, when the sense and the fear of her loneliness crept closest to her, and chilled and vexed her most, she would wish to be able to think of Long Dick in the way that he and Mrs. Balls coveted that she should think of him,

and to believe that she might be happy with him, although there could never be full sympathy between them.

Pleasance was aware that Lizzie Blennerhasset's claim on Long Dick was no claim at all, that Lizzie herself owned freely that it was so, and would never have proposed to urge it against another, yet it counted something with Pleasance both for and against Dick's suit.

This claim of Lizzie's offered a puzzle and a fascination to Pleasance. In all the experience which she had drawn from books more than from life, an unrequited attachment was a thing to be concealed, so that one should die rather than confess it—to be left to "prey like a worm in the bud" unseen, and unsuspected till the worm had done its worst.

All maidenly dignity and pride demanded that it should be so. True, some of Shakespeare's heroines in the grievous plight, in spite of Shakespeare's words, not only owned the soft impeachment to themselves, but also stooped so far as to allow themselves what comfort could be had, in the circumstances, in the shape of confidants.

However, Pleasance accounted for this by remembering that the world was younger, and might very well be franker and plainer spoken in Shakespeare's day, and by granting something to the exigencies of plays.

Against this experience Lizzie Blennerhasset, whom Pleasance knew, as she knew herself, to be a modest girl—was it because of her class, or still more because of her misfortune?—made not the slightest attempt to deny her hopeless love for and devotion to Long Dick. That Lizzie Blennerhasset would lay her hair in the dust before Long Dick's feet, was so perfectly well known, as well as so unmistakably fruitless, as to have almost passed beyond discussion in Saxford, which made a favourite hero of Dick and an object of pity of Lizzie.

It was an acknowledged fact to all the Blennerhassets, from father and mother down to Clem, the least gossiping of the family, to be referred to angrily, scornfully, or tolerantly, as the speaker felt inclined, but no more to be ignored than it was doubted.

Of course Long Dick was perfectly aware of Lizzie's love, though certainly in words she never expressed it to him, and was accustomed to have it coolly referred to, and coarsely jested upon by all his friends, save by Pleasance Hatton, who could not help practising the reticence for her friend which Lizzie did not think of practising in any respect save in speech—for herself.

Lizzie could see no shame in her love for her cousin Dick, in her untiring recurrence to the old story of her deliverance when a child from the burning smithy-house by Dick, telling it over and over again to whoever had the patience to listen to her. That deliverance was the central point, the great romance in Lizzie's young life, so that it bulked largely in it, dominated over all the rest, and bound her as Dick's servant and slave for ever.

Lizzie dreamt of Dick by day and night, ministered to him in every way that she could contrive, sewed for him and sedulously attended to his wardrobe in the middle of her dressmaking, schemed to bring him pleasure, as a mother will seek to please her child at the expense of her own ease and comfort, screened him when he was in trouble, and never concealed all the time, either from herself or practically from him or from others, that it was with her very heart's blood that she was thus serving him.

Lizzie had naturally been the very first to see Dick's worship of Pleasance Hatton, but if it gave her a pang, she was so inured to pangs, or rather she was in such an exalted, ecstatic state, like that of a willing martyr with regard to Dick, that she was hardly aware of the pain. She sought to promote Dick's cause with Pleasance; and at the same time it was to Pleasance that Lizzie, unasked, but without a thought of deceit and self-seeking, expatiated fervently, yet with a kind of passionless despair, on her love for Dick.

"Lookee, Pleasance, I know when he is in the room without I 'a seed him; I feel when he is a-comin' afore he is in sight. I could kiss the wely ground he steps on; there is none as is like he, such a strapping lad, yet so good to a poor sickly cripple gal as is only his cousin and will never be no more, little bettern a plague with her fondness for he. Do 'ee think, Pleasance, if I had not got that fall as did for my hip joint, and if I had grown up straight and strong, and run about like the others, that Long Dick would ever 'a looked at me? Laws! sometimes I please myself with thinking on it," said Lizzie, with an inexpressibly wistful look in her blue eyes, "and how he would never 'a needed to beg and pray to me, for I 'ould never 'a said Dick nay, and how mortal happy I 'ould 'a been in making him happy. But there, it's no use thinking on it, it is none for me, it is for you, and you'll do it some day, Pleasance, though you dunno care half enough, now, for your blessed power, no more nor for your fair face and body, and your know, and your

a-coming on gentlefolk as helps to make you as is a true woman, gentle."

Pleasance was struck and touched by this phenomenon of utterly lowly, utterly generous love that made no demand for return, that had not even a thought of demeaning itself by its own lavish, lightly-held expenditure. Pleasance not only felt that anything which she could ever be to Dick Blennerhasset would be small and poor, but it seemed to her that she could never love—it was not in her to love—any man, though he were the very prince, the king's son of old romance, come to woo and win her gallantly, with such a love as poor Lizzie Blennerhasset spent without stint on her calmly kind, sometimes unheeding, sometimes half-affronted, half-impatient cousin Dick.

But though Pleasance contemplated the association between Long Dick and his cousin Lizzie with a girl's interest and with a marvel of her own, she had sense and justice to prevent her looking on the association as a barrier to Dick's suit to herself. Lizzie herself deprecated the idea. Thus, while Pleasance would no more have been guilty of stealing a friend's lover, and pluming herself on the theft, than she would have stolen the gown or shawl from some friend's back and boasted of the deed, she admitted the perfect right of the man whom Lizzie Blennerhasset loved, but who was only her cousin and friend, to approach her, Pleasance, with his love.

Therefore, Long Dick ought never to have had brief moments of frenzy against Lizzie, in which he blamed her and would have visited on her the distance which he could not for the life of him lessen, at which he stood from Pleasance Hatton. Happily, they were only moments, not long enough to inflict on Lizzie more than momentary anguish, or to turn Pleasance against him as with horror at his brutality and cruelty.

Long Dick conducted himself generally to Lizzie like a true man who has capacities for tenderness in his truth, and is well-conditioned at the core. He did not trade upon her regard; he did not accept it with a coxcomb's heartlessness as a tribute to his captivations, far less make a mock of it as a man who would seethe a kid in its mother's milk. Like Lizzie, he could never forget that he had saved her life, and had, with a feeling, even as a boy, of that mysterious bond between them, taken a keener interest after the first days of absolute danger to her life, than any of her family had taken in Lizzie's recovery and well-being. So long as she had

been a child, he had carried and wheeled and helped her about in her infirmity, and he had never forgotten her, but had come and sat with her, and brought her little gifts to lighten her weary days. He could not help it, and he supposed that she could not help it, that the girl had got fond of him, he was not to alter his treatment of her—or for that matter his real regard for her on that account.

Pleasance saw and appreciated Long Dick's forbearance with Lizzie.

Thus it was not Lizzie Blennerhasset altogether, or even in a great degree, who stood between Long Dick and Pleasance. And Pleasance certainly did not disdain, though she did no more as yet than suffer his suit. She took it as an honour. She had sometimes a lighter, half coquettish pleasure in it, for she was a young woman with a woman's desire to be loved. But for the most part she was rather disposed to regard it as a difficult problem, which was set her to solve.

CHAPTER XI.—THE INHERITANCE.

"HERE, Pleasance, I 'a brought a letter for you," said Mrs. Balls, coming into the Manor kitchen on her return from an afternoon errand to and gossip in Saxford, during the slack season of the fall, a month or two after midsummer. She was so impressed with the importance of what she carried, that though she was short-winded in walking, she made her voice be heard in a panting cry outside the door, and entered holding out the letter, well covered by her ample fingers clad in silk gloves, in a nice distinction between the kid of a lady and the cotton of a working woman, neither of which was quite suitable to Mrs. Balls, who was a housekeeper in a respectable situation under Lawyer Lockwood.

"A letter for me!" said Pleasance, pausing as she took the offered letter, and staring at it as if she had been a South Sea islander, who, having never learnt to write, and having never had any communication made to her by such signs, looks upon their embodiment in a bit of soiled paper with suspicion and uneasiness.

"It be," answered Mrs. Balls succinctly. "I 'a got it from the post-office. Postmaster calls me in as I was a passin', and says he, 'There is a big un for your Miss Hatton,' he says, and I says, 'Be there no mistake, Mister Case? for Pleasance do not be in the way of gettin' letters, havin no kith or kin she owns saving myself?' and he answers, 'There be no mistake; do you think I can-

not read write, missus? It would be as much as my place were worth an I couldn't, and how do you know who Miss Hatton may or may not correspond with?" he says, with a kinder wink as a joke atween he and me. But I up and tells him I were sure to know as you were a born lady, and had no mean shufflin', deceivin' ways. I showed the letter to Missus Graylin' next, and she at me in the same line. 'It will be sweethearting she'll be arter,' she says, 'and you had better be arter her,' says she, 'for them half-breeds are the wust to deal with;' and I says to that, 'Missus Graylin', I know Pleasance Hatton, child and gal, bessn I know you, and her is not half-breed. She d' be a lady by birth, to be sure, but she is bessn than that, an honest young 'oman as is proud to work for her bread honest like, and 'ould scorn a dirty trick to cheat her cousin and frien'—"

Mrs. Balls took breath, and resumed the thread of her discourse.

"More than that, Long Dick is lookin' arter her,' I says, 'and none other, and he do not be so great a hand with his pen as to take to it, rather than speak to the gal in the porch, or by the haystack, or when the hosses and the cattle are a-watering at the troughs, as he may do any day in his life. Long Dick is not such a book-learned fool as to try a dead goose's quill or a bit on sharpened steel when he can speak with the livin' lip, to the livin' ear.'"

Pleasance had heard very little of the great sensation and discussion which her letter had provoked. She was absorbed in the effect which it produced on herself.

Strangely enough, it was the first letter which she had received since she came to the Manor. It was like a waif and stray from the past, and she sat with it in her hand, thinking how she used to feel when her father's American letters came, or when some school-girl home for the holidays had a thought of her absent companion, who was so much less happy than she, inasmuch as she had no home holidays, and so spared a moment to write a little letter, half prattling, half slap-dash, in which there were a great many errors, seeing that there was no Miss Smith or Miss Eckhard at hand to correct them, but which was to cheer Pleasance in her perpetual exile. If it had struck Pleasance that her present letter was not so much a relic as an effort at the renewal of the past, she would have shrunk from it. When at last she opened it, and glanced over it, she put it hastily down, with a strong revulsion.

"It is not intended for me," she said to Mrs. Balls, who was waiting in her bonnet and shawl, without the smallest pretence of going out of the way, or of not caring to hear, or indeed of expecting anything else than that the letter should be immediately read out, slowly and distinctly, that she might catch every word.

"It has been intended for Anne," said Pleasance, with something of the jarred-on, shocked feeling with which, as occasionally happens, we find the dead addressed as the living, in communications which can no more reach or concern them.

"You dunno say it, Pleasance," exclaimed Mrs. Balls, scandalized, "and who do the writer be, or what can he 'a to say to your sister, as were little bessn a child when she were took, poor gal?"

"It is something about the money that papa left," said Pleasance simply, taking up the letter, and proceeding to study its contents. "It is from the lawyer who has had charge of it, I suppose. He writes:—

'TO MISS ANNE HATTON, THE MANOR
FARM, SAXFORD.

'MADAM,—Our firm was instructed on the 27th of April, 1855, by our client, Lionel Wyndham, Esquire, of Sufton Hall, Northamptonshire, to assume the management of a sum of money for the benefit of you and your sister, being the children of the late Frederick Hatton, Esquire. The sum in question was £430 (four hundred and thirty pounds), being what remained to the account of your late father at his banker's, Drummond & Co. The money was under the control of the said Lionel Wyndham, as the husband of the late Mr. Hatton's sole surviving sister, and your lawful guardian, but was transferred to our care to save our client the necessity of active steps, which under the circumstances he did not desire to take in the matter. According to his directions, the money was to remain in the bank until application was made for the whole or part of the fund, on your account or on that of your sister, by such of your relations on the mother's side as had constituted themselves your guardians, and as we, acting for your lawful guardian, should consider eligible to be your representatives. We find that no such claim has been made, and that the money has been left, doubtless pending you and your sister's coming of age and taking possession of your shares. As by comparing dates, and the certificates with which

we were furnished, on the transfer of Mr. Wyndham's power to us, that time is close at hand, we await your orders as to the disposal of the money, which, allowing for interest, and deducting the usual expenses, now amounts to the sum of four hundred and sixty-seven pounds, eighteen shillings, and threepence, of which your share is two hundred and thirty-three pounds, nineteen shillings, and one penny halfpenny.

'I remain your obedient servant,

'JOHN HARDWICKE, for FAIRLIE & Co.'

Mrs. Balls, after listening with open ears, had been thunderstruck by the contents of the letter. The first symptoms which she gave of recovery was to throw up her silk-gloved hands in the air, dropping from the left hand an alpaca umbrella, which fell with a crash on the floor, and made the cat on the hearth start up and fly for its life, and Pleasance's canary bird stop in pecking its seed, and, with its head on one side, inquire with its beads of black eyes what could be the matter?

"Lo' a' mussy, Pleasance, you 'a come into a fortin. I knew allers summat 'ould be yourn when you were one-and-twenty, for Lawyer Lockwood—he said as much, when you comed fust. But did I ever think it were hunders and hunders on pounds? You are a heiress, my gal, as need never soil your fingers more, 'cept for choice, not so long as you live. As for Long Dick, poor chap, I doubt he's a long way behind you now, unless you think differently. It is liker it were Squire Lockwood's son, as is a scapegrace, the more's the pity, unless he be to pick up. You and me will live together, Pleasance, and have a likely gal to wait on us, and flummery as well as turnovers to eat every day. We can go where you like, to Cheam or to Lunnon, though I never were town-bred, and I doubt I 'ould miss the beasteses, as I have been used to all my life, and what will become of Lawyer Lockwood's cheeses, yet a while, afore he a' got a proper peyson into my shoes, I cannot tell. But it is for you to name the place and seek your pleasure, Pleasance, since you 'a come into your fortune."

"But I have not come into it yet, Mrs. Balls," said Pleasance, shaking her head. "This letter was for Anne, and she was two years older than I."

Mrs. Balls could not bear to think of any delay in the golden shower which had so suddenly fallen on Pleasance, and through Pleasance on herself. "But, mor, if you

write and tell en, they'll never be so hard as to keep you any longer out of your fortin," pled Mrs. Balls, quite piteously, on the back of her exultation. "Why, Pleasance, though I should not say it to hurt a gal as is hale and hearty, thank God, still life is but grass and worms, as passon says, and at this rate you might not live to get your fortin, or any pleasure out on it. See how your poor sister, as was a deal younger than you are now, was took at a stroke."

"And is not Anne infinitely better off than I am now?" said Pleasance softly and steadfastly; "we are Christians, and believe that."

"Oh, yes, we are Chrissens," said Mrs. Balls, still chafing, "and make the best on our losses; but I do not see, for my part, what being Chrissens 'a to do in forbidding us from entering on our fortens. I think it do be kinder thankless and grudging to speak so, Pleasance."

"And though we had this poor little remnant of my father's portion in our hands, at this moment, we could not, even if we wished it, live like idle ladies upon it. I know so much as that, from the spending of my earnings, and from what I have heard Long Dick calculate about his savings, and what I have read; it would not serve us over three or four years. I remember Mrs. Wyndham took care to point that out to our inexperience—to Anne's and mine, when we were poor young girls," ended Pleasance, looking back with wistful commiseration on her former self.

But Mrs. Balls could not see anything except that Pleasance was "contrairy."

"I am sure I should not know how to be an idle lady now; I should prove but a sorry specimen after having been busy and useful all these years," Pleasance tried to coax her old friend. "I could not keep my hands still, I should be for ever putting out the cloven foot; and you, Mrs. Balls, would weary your heart out."

"Then what may you be goin' to do, may I ax?" said Mrs. Balls severely; "let the money, as your poor father meant to be yourn, lie still in that bank, to serve your enemies, and as if that bank were an old stocken', till it d' be robbed or broke, or what not, while you be growed so fine you'll not stir your foot to touch hunders because they beant thousands. Oh! Pleasance, the pride of the human heart, passon ain't far wrong there."

"I never said I would not touch it, dear," said Pleasance, looking up brightly. "I'll

write that, 'alas! there is nobody but me, and I'll bide my time; and then, Mrs. Balls, though we do not care to be turned back into idle ladies—to waste the one day, and want the next—though we are wise enough to keep our place, and go on working, because we have got used to work, and because we know work is far the best, doing our duty in the station to which we have been called—yes, I was called to it too, and more solemnly than you—we'll not be above taking the good of our fortune; we'll buy a 'tidy few things,' and cut a few capers from our store. Don't you see it will be far better than having to live upon the money, when it would not go far or last long? It will be something to get pleasure from, as well as to fall back upon, for those rainy days that working people are always hearing about, as if working people, with simple needs, should not be better armed than any other people against rainy days. Why, Mrs. Balls, I am not indifferent, I am quite uplifted with the prospect of coming into my fortune."

Mrs. Balls was not reconciled that night to such moderation, if it were not sheer apathy or close-fistedness that was creeping over Pleasance. Mrs. Balls was very unhappy and cross in thinking. Did her young cousin mean to keep her fortune to herself, and was she but eluding her in seeking to depreciate and make light of the great news? A poor return for all that Mrs. Balls had done for the girl and her sister—a miserable specimen of the selfishness and heartlessness in which even gentle birth on one side may result. Mrs. Balls had not cherished such ungenerous and unjust thoughts often, or been more out of sorts—not when pleuro-pneumonia had been apprehended among Lawyer Lockwood's cows. So much for the effect of even the announcement of a little fortune coming to one member of a united family party.

But a night's rest cleared away the cobwebs of misunderstanding. Mrs. Balls rose satisfied of Pleasance's integrity and kindness, as she was of her own. She began to comprehend that she was too old for a change of life, and that it was well for her that Pleasance was contented not to rise again in the world. This did not hinder, it probably enhanced in the end, as with the added consciousness of sober self-respect and prudent humility and general well-doing, Mrs. Balls' satisfaction and delight in dwelling on Pleasance's coming hundreds, which were to remain in the bank, and in communicating the fact of their exist-

ence and boasting of it, with an elaborate attempt at modesty, which by no means extinguished the boasting, to Mrs. Blennerhasset and Mrs. Morse, until the information spread like wildfire over Saxford.

As for Pleasance, her feelings were in the first place exactly what she had described them, after the first startling sensation imparted by the tidings; she was girlishly, almost childishly, pleased with hearing of having a little, not too much, money of her own, of which until this reminder she had no distinct conception, and indeed had nearly forgotten, since she had judged, when she remembered it at all, that it might have taken wings and vanished out of her sight like other and more precious things.

If the money had been some large sum, Pleasance felt that she would have been in a strait, encumbered and distressed, for what could a girl who had cast in her lot with working people, and who was herself grown up a working woman, do with a fortune? It would have become a snare and a stumbling-block to her and her neighbours; it would have rendered her the prey of designing persons; it would have been a glaring incongruity robbing her life of all simplicity and harmony. She should not have known what to do with the golden burden, and if she had been compelled, in pure self-defence, and as a duty of property, to draw apart from the class in which she had found shelter, and to mount again in the ranks, how abashed she should have been, with her real sentiments! What a traitress she should have considered herself to all her own convictions and resolutions! How she must have ended by being painfully convinced that she was from home, and hampered and degraded!

But as it was, these hundreds of pounds were no distracting obligation either in prospect or in actual possession, in place of threatening to make Pleasance a poor rich woman, they promised to make her what was quite different, a rich poor woman. They would supplement her sufficient stock, and furnish her with opportunities for gratifying many an innocent inclination, and doing many a deed that she strongly desired to do.

When Pleasance was a school-girl at the Hayes, she had heard some girl or governess sing an old-fashioned song, in which the singer coveted the possession of a four-leaved shamrock, and vowed, if she held the ancient charms, she would exercise it in acts of universal beneficence. Pleasance felt as if she were the possessor of this shamrock, or what was perhaps a happiness with a more delicate

bloom, as if she were the anticipator, by sure and certain anticipation, of the possession of the shamrock.

For days after the receipt of the lawyer's letter Pleasance went about housekeeping for Mrs. Balls, hanging up dried herbs, taking up carrots and onions, finding stray chickens, chattering to Mrs. Balls, and even to Long Dick, when she came across him, more freely than was her wont, and all the time her mind was full of happy projects. She would buy a screen to keep off the draught from the door, and a soft big chair for Mrs. Balls, easier than the great oaken receptacles in which she and Anne had sat on the April evening when they had come to take refuge at the Manor. She would buy such a crutch for Lizzie Blennerhasset as should greatly lighten her lameness. She would buy a new fiddle, or if the old were better, new and suitable music, and pay for courses of lessons for Clem Blennerhasset. She would—well, what could she do that would not compromise her with Long Dick? She would buy a spick and span new silver-mounted whip, which should be Dick's own, not Lawyer Lockwood's, and which she could trust Dick not to use unmercifully on her friends Dobbin or Diamond or Prince or Punch. She would be able to pay for the doctor and physic, and to provide a constant supply of wine and little dainties for poor Molly Griffith, who was dying of consumption in the village. She would buy a fresh fine cage fitted up with every convenience for her bird, and a fresh fine collar, only he would not appreciate it—better give him an additional bone—for Jowler.

The first diminution to Pleasance's happiness was caused by perceiving that the story of her coming fortune had roused the old, and as she thought the dead, suspicion and antagonism against her among the village girls, while their elders spoke to her with a cautious reserve and a crafty deference in midst of their independence which Pleasance liked quite as ill as the suspicion and antagonism. With the girls the offence of the coming hundreds was still more serious than the offence of wearing spectacles, and in reference to it the old jeering title "Madam" or "My lady" was revived and bandied about worse than before, and with it the disparaging distinction which, in the minds of the spiteful speakers, had become so inappropriate—ay, there was the rub—that it was a special taunt to use it now, of "gentle beggar."

Lizzie Blennerhasset formed an exception to this rout, but even Lizzie offended and affronted Pleasance by supposing that she would have her "gownds" made in Cheam in another year or so, and not by a common dressmaker with a common cut, like Lizzie.

Pleasance twinkled away moisture that would gather in her eyes, in the midst of her cheery anticipations, at the world's injustice, while she was bent on living it down.

Then there came a new trouble. Long Dick, who had taken utter despair to himself, and fairly shunned Pleasance with a sullen, bitter air which he had not shown before, from the day that he heard that she was to have such an inheritance, broke out worse than ever, while Lizzie Blennerhasset was miserable and Pleasance remorseful.

What help for it? and small blame to him, said the gossips, when the girl he had been going after for years, and had set his whole heart upon, would never have him, since she had word of a fortune, and fine friends to follow, very likely. They dared say not. She had not been his bargain before, as the poor fellow had seen, and had given herself airs—though she had pretended not—which she might have spared; and it needed no Solomon to see that it was all up with Long Dick. Pleasance Hatton would look, as she had always been looking, on the sly, for all her affectation of friendliness, a great deal higher; she might get a small shop-keeper or a ship-captain in Cheam, with her hundreds to fill his shop or buy his ship.

These cool conclusions which were falling like a bolt of ice on Long Dick's heart, and burning into it, for ice as well as fire burns, came to Pleasance's ears.

"Who says that I have given them any right to foretell what will become of me? Nobody has such a right," cried Pleasance indignantly. "How dare anybody invent such wicked lies as that money will ever come between me and my friends, or change me to them in the smallest jot or tittle?"

The village gossips all but drove her into Long Dick's arms; she was stung into seeking him in the freedom of their intercourse, even as he fled from her, and into being so kind to him that her fate had nearly passed out of her hands then and there. The ardour of Long Dick's gratitude saved her, for Pleasance quailed and drew back anew before that ardour.

PREPARE TO MEET THY GOD.

AMOS iv. 12.

A Sermon preached in Westminster Abbey, November 15th, 1874.

BY THE LATE CANON KINGSLEY.

WE read to-day, for the first lesson, parts of the prophecy of Amos. They are somewhat difficult, here and there, to understand; but nevertheless Amos is perhaps the grandest of the Hebrew prophets, next to Isaiah. Rough and homely as his words are, there is a strength, a majesty, and a terrible earnestness in them, which it is good to listen to, and specially good now that advent draws near, and we have to think of the coming of our Lord Jesus Christ, and what his coming means.

"Prepare to meet thy God," says Amos in the text. Perhaps he will tell us how to meet our God.

Amos is specially the poor man's prophet, for he was a poor man himself; not a courtier like Isaiah, or a priest like Jeremiah, or a sage like Daniel, but a herdsman and a gatherer of sycamore fruit in Tekoa, near Bethlehem, where Amos was born. Yet to this poor man, looking after sheep and cattle on the downs, and pondering on the wrongs and misery around, the word of the Lord came, and he knew that God had spoken to him, and that he must go and speak to men, at the risk of his life, what God had bidden, against all the nations round, and their kings, and against the king and nobles and priests of Israel, and the king and nobles and priests of Judah, and tell them that the day of the Lord was at hand, and that they must prepare to meet their God. And he said what he felt he must say with a noble freedom, with a true independence such as the grace of God alone can give.

Amaziah, the priest of Beth-el, who was worshipping (absurd as it may seem to us) God and the golden calf at the same time in King Jeroboam's court, complained loudly, it would seem, of Amos's plain speaking. How uncourteous to prophesy that Jeroboam should die by the sword, and Israel be carried captive out of their own land! Let him go home into his own land of Judah, and prophesy there; but not prophesy at Beth-el, for it was the king's chapel and the king's court. Amos went, I presume, in fear of his life. But he left noble words behind him. "I was no prophet," he said to Amaziah, "nor a prophet's son, but a herdsman, and a gatherer of wild figs. And the Lord took me as I followed the flock, and said, Go prophesy

unto my people Israel." And then he turned on that smooth court-priest Amaziah, and pronounced against him, in the name of the Lord, a curse too terrible to be repeated here.

And now what was the secret of this inspired herdsman's strength? What helped him to face priests, nobles, and kings? What did he believe? What did he preach?

He believed and preached the kingdom of God and his righteousness; the simple but infinite difference between right and wrong, and the certain doom of wrong, if wrong was persisted in. He believed in the kingdom of God. He told the kings and the people of all the nations round, that they had committed cruel and outrageous sins, not against the Jews merely, but against each other. In the case of Moab, the culminating crime was an insult to the dead. He had burned the bones of the king of Edom into lime. In the case of Ammon, it was brutal cruelty to captive women; but in the cases of Gaza, of Tyre, and of Edom, it was slave-making and slave-trading invasions of Palestine.

"Thus saith the Lord: For three transgressions of Gaza, and for four, I will not turn away the punishment thereof; because they carried away the whole captivity, to deliver them up to Edom. But I will send a fire upon the wall of Gaza, which shall devour the palaces thereof."

Yes. Slave-hunting and slave-trading wars—that was and is an iniquity which the just and merciful Ruler of the earth would not, and will not, pardon. And honour to those who, as in Africa of late, put down those foul deeds, wheresoever they are done; who, at the risk of their own lives, dare free the captives from their chains, and who, if interfered with in their pious work, dare execute on armed murderers and manstealers the vengeance of a righteous God. For the Lord God was their king, and their judge, whether they knew it or not. And for three transgressions of theirs, and for four, the Lord would not turn away their punishment, but would send fire, and sword among them, and they should be carried away captive, as they had carried others away.

But to go back. Amos next turns to his own countrymen—to Judah and Israel, who

were then two separate nations. For three transgressions of Judah, and for four, the Lord would not turn away their punishment, because they had despised the law of the Lord, and had not walked in his commandments. Therefore He would send a fire on Judah, and it should devour the palaces of Jerusalem.

But Amos is most bitter against Israel, against the court of King Jeroboam at Samaria, and against the rich men of Israel, the bulls of Bashan, as he calls them. For three transgressions, and for four, the Lord would not turn away their punishment.

And why?

Now see what I meant when I said that Amos believed not only in the kingdom of God, but in the righteousness of God. It was not merely that they were worshipping idols—golden calves at Dan, and Beth-el, and Samaria, at the same time that they worshipped the true God. That was bad, but there was more behind.

These men were bad, proud, luxurious, cruel; they were selling their own countrymen for slaves—selling, he says twice—as if it was some notorious and special case—an honest man for silver, and the poor for a pair of shoes. They were lying down on clothes taken on pledge by every altar. They were breaking the seventh commandment in an abominable way. They were falsifying weights and measures, and selling the refuse of the wheat. They stored up the fruits of violence and robbery in their palaces. They hated him who rebuked them, and abhorred him that spoke uprightly. They trod upon the poor and crushed the needy, and then said to their steward, "Bring wine, and let us drink." Therefore though they had built houses of hewn stone, they should not live in them. They had planted pleasant vineyards, but should not drink of them.

And all the while these superstitious and wicked rich men were talking of the day of the Lord, and hoping that the day of the Lord would appear.

You—if you have read your Bibles carefully and reverently, must surely be aware that the day of the Lord, either in the Old Testament or in the New, does not mean merely the final day of judgment, but any striking event, any great crisis in the world's history, which throws a divine light upon that history, and shows to men—at least to those who have eyes wherewith to see—that verily there is a God who judges the earth in righteousness, and ministers true judgment among the people—a God whom men, and

all their institutions should always be prepared to meet—lest coming suddenly, he find them sleeping.

If you are not aware of this, the real meaning of a day of the Lord, a day of the Son of man, let me entreat you to go and search the Scriptures for yourselves; for in them ye think ye have eternal life; and they are they which testify of the Lord—of that Eternal Son of whom the second Psalm speaks, in words which mobs and tyrants, the atheist and the superstitious, are alike willing to forget.

In the time of Amos, the rich tyrants of Israel seem to have meant by the day of the Lord, some vague hope that, in those dark and threatening times, He would interfere to save them, if they were attacked by foreign armies. But woe to you that desire the day of the Lord, says Amos the herdsman. What do you want with it? You will find it very different from what you expect. There is a day of the Lord coming, he says, therefore prepare to meet your God. But you are unprepared, and you will find the day of the Lord very different from what you expect. It will be a day in which you will learn the righteousness of God. Because He is righteous He will not suffer your unrighteousness. Because He is good, He will not permit you to be bad. The day of the Lord to you will be darkness and not light, not as you dream deliverance from the invaders, but ruin by the invaders, from which will be no escape. As if a man did flee from a lion and a bear met him; or went into the house and leant his hand on the wall, and a serpent bit him. There will be no escape for those wicked men. Though they dug into hell, God's hand would take them; though they climbed up into heaven, God would fetch them down; though they hid in the bottom of the sea, God would command the serpent and it should bite them. He would sift the house of Israel among all nations like corn in a sieve, and not a grain should fall to the earth. And all the sinners among God's people should die by the sword, who say, "The evil shall not overtake us." This was Amos's notion of the kingdom of God and his righteousness. These Israelites would not obey the laws of God's kingdom, and be righteous and good. But Amos told them, they could not get rid of God's kingdom. The Lord was King, in spite of them, and they would find it out to their sorrow. If they would not seek his kingdom and his government, his government would seek them, and find them and

find their evil doings out. If they would not seek God's righteousness, his righteousness would seek them, and execute righteous judgment on them.

No wonder that the Israelites thought Amos a most troublesome and insolent person. No wonder that the smooth priest Amaziah begged him to begone and talk in that way somewhere else. He saw plainly enough that either Amos must leave Samaria, or he must leave it. The two could no more work together than fire and water. Amos wanted to make men repent of their sins, while Amaziah wanted only to make them easy in their minds; and no man can do both at once.

So it was then, my friends, and so it will be till the end of this wicked world. The way to please men, and be popular, always was, and always will be, Amaziah's way; to tell men that they may worship God and the golden calf at the same time, that they may worship God and money, worship God and follow the ways of this wicked world which suit their fancy and their interest; to tell them the kingdom of God is not over you now, Christ is not ruling the world now; that the kingdom of God will only come, when Christ comes at the last day, and meanwhile, if people will only believe what they are told, and live tolerably respectable lives, they may behave in all things else as if there was no God, and no judgments of God.

And seeking the righteousness of God, say these preachers of Amaziah's school, only means, that if Christ's righteousness is imputed to you, you need not be righteous yourselves, but will go to heaven without having been good men here on earth. That is the comfortable message which the world delights to hear, and for which the world will pay a high price to its flatterers.

But if any man dares to tell his fellow-men what Amos told them, and say, The kingdom of God is among you, and within you, and over you, whether you like or not, and you are in it; the Lord is King, be the people never so unquiet; and all power is given to Him in heaven and earth already; and at the last great day, when He comes in glory, He will show that He has been governing the world and them all along, whether they cared to obey Him or not:—if he tell men, that the righteousness of God means this—to pray for the Spirit of God and of Christ, that they may be perfect as their Father in heaven is perfect, and holy as Christ is holy, for without holiness no man shall see the Lord: if he tell men, that the

wrath of God was revealed from heaven at the fall of man, and has been revealed continuously ever since, against all ungodliness and unrighteousness of men, that indignation and wrath, tribulation and anguish will fall on every soul of man that doeth evil, and glory, honour, and peace to every man that worketh good:—when a man dares to preach that, he is no more likely to be popular with the wicked world (for it *is* a wicked world) than Amos was popular, or St. Paul was popular, or our Lord Jesus Christ, who gave both to Amos and to St. Paul their messages, was popular.

False preachers will dislike that man, because he wishes to make sinners uneasy, while they wish to make them easy. Philosophers, falsely so-called, will dislike that man, because he talks of a kingdom of God, the providence of God, and they are busy—at least, just now—in telling men that there is no providence and no God—at least, no living God. The covetous and worldly will dislike that man, for they believe that the world is governed, not by God, but by money. Politicians will dislike that man, because they think that not God, but they, govern the world, by those very politics and knavish tricks, which we pray God to confound, whenever we sing "God save the Queen."

And the common people—the masses—who ought to hear such a man gladly, for his words are to them, if they would understand them, a gospel, and good news of divine hope and deliverance from sin and ignorance, oppression and misery—the masses, I say, will dislike that man, because he tells them that God's will is law, and must be obeyed at all risks. And the poor fools have got into their heads just now that not God's will, but the will of the people, is law, and that not the eternal likeness of God, but whatever they happen to decide by the majority of the moment, is Right. And so such a preacher will not be popular with the many. They will dismiss him, at best, as they might a public singer or lecturer, with compliments and thanks, and so excuse themselves from doing what he tells them. And he must look for his sincere hearers in the hearts of those—and there are such, I verily believe, in this congregation—who have a true love and a true fear of Christ, their incarnate God—who believe, indeed, that Christ is their King, and the King of all the earth, who think that to please Him is the most blessed, as well as the most profitable, thing which man can do; to displease Him

the most horrible, as well the most dangerous, thing which man can do ; and who, therefore, try to please Him by becoming like Him, by really renouncing the world and all its mean and false and selfish ways, and putting on his new pattern of man, which is created after God's likeness in righteousness and true holiness. Blessed are they, for of them it is written, "Blessed are they that hunger and thirst after righteousness, for they shall be filled." Even Christ himself shall fill them. Blessed are they, and all that they take in hand, for of them it is written, "Blessed are all they that fear the Lord, and walk in his ways." For thou shalt eat the labours of thine hands ; the Lord is righteous in all his ways, and holy in all his works. The Lord is nigh unto them that fear Him, yea, unto all that call upon Him faithfully. He also will fulfil the desire of them that fear Him. He also will hearken—ay, and will help them.

Happy, ay, blest will such souls be, let the day of the Lord appear when it will, or how it will. It may appear, the day of the Lord, as it has appeared again and again in history, in the thunder of some mighty war. It may appear after some irresistible, though often silent revolution, whether religious or intellectual, social or political. It will appear at last, as that great day of days, which will

conclude, so we believe, the drama of human history, and all men shall give account for *their own works*. But, however and whenever it shall appear, they at least will watch its dawning, neither with the selfish assurance of modern Pharisaism, nor with the abject terror of mediæval superstition ; but with that manful faith with which he who sang the 98th Psalm saw the day of the Lord dawn once in the far east, more than two thousand years ago, and cried with solemn joy, in the glorious words which you have just heard sung—words which the Church of England has embodied in her daily evening service, in order, I presume, to show her true children how they ought to look at days of judgment ; and so prepare to meet their God :—

"Show yourselves *joyful* unto the Lord, all ye lands. Sing, rejoice, and give thanks.

"Let the sea make a noise, and all that therein is: the round world, and they that dwell therein.

"Let the floods clap their hands, and let the hills be joyful together before the Lord.

"For He cometh to judge the earth.

"With righteousness shall He judge the world ; and the people with equity.

"Glory be to the Father, and to the Son, and to the Holy Ghost :

"As it was in the beginning, is now, and ever shall be, world without end. Amen."

BALLAD.

IN a grand old German city
There stands an Orphan's Home,
Where all stray lambs, for pity,
Are folded as they come ;
They fill four hundred places,
Unwelcomed, undismised,
And all those little faces
No mother-lips have kissed.

There came a great disorder
On the brave old German land,
With battles on her border
And mighty foes at hand ;
And wounded, sick, and dying,
By many a mournful score,
In Leipzig town were lying
Till there was room no more.

Then spake a Proclamation,
"O, loyal Leipzig men,
The soldiers of the nation
Serve every citizen ;
Take home these orphan children
Till good times come anew,
And make their hall a hospital
For those who bleed for you !"

Soon in the quiet places
Of children's sleep or play,
Long rows of restless faces,
Bearded and war-worn, lay ;
And the children went, half-frightened,
Into a world unscanned,
Where many a small clasp tightened
On many a careless hand.

By many a fireside sitting,
Goodman to goodwife spake,
"We take this charge, as fitting,
For our dear country's sake ;
The toils of war with reason
The fruits of peace should earn,
And it is but for a season,
And the children will return."

In walked each helpless stranger,
With such a doubtful face,
Half in the fear of danger,
Half in the hope of grace ;
They thought—as memory rouses
Dreams of their big bare hall—
"O ! these must be children's houses,
Because they are so small !

"On tiptoe I should be able
To reach that trim-set shelf,
I can dine at this toy-table,
And carve the meat myself;
Can I venture to ask it,
Is this little chair for me?
Is there a babe in that basket?
And may I peep and see?"

Strange were the simple labours
Where children could do half,
Strangest of all, the neighbours
Who came to talk and laugh;
Life grew a pleasant story,
With all things strange and sweet,
And O! the honour and glory
Of errands in the street!

The days were busy and cheery,
The food was just enough,
And if sometimes the wife was weary,
Or sometimes the man was rough,
Why, cuffs were followed by kisses,
And showers made air serene,[†]
And where's the child that misses
The calm of a cold machine?

The war-tide paused, receded,
The strong land laughed again,
And room no more was needed
For men in their battle-pain;
Then spake a Proclamation,
And the good words seemed to burn,
"There is joy through all the nation,
And the children may return."

O! strong land that rejoices
When those good words are said,

Did you hear the children's voices
From many a little bed?
Did they waken, hardly knowing
What was about to be,
Then whisper, "I am going;
There is no joy for me."

I think their Father heard them,
For when that morning comes
One joyful thing, is happening
In four hundred Leipzig homes;
The goodwife looked at the goodman,
And wistfully she smiled,
But he spoke out, with never a doubt,
"We'll keep our orphan child!"

It was only the kind hours moving,
And the common daily light
Had taught the trick of loving,
Through word and touch and sight;
And they never questioned whether
Trouble or loss might come,
For their hearts had grown together
In the little life at home.

Now all you German people,
For peaceful nights and days,
Let tower and throne and steeple
Send up their songs of praise
But God can make an altar
Of every cottage hearth,
And children's lips can falter
The happiest hymns on earth.

MENELLA E. SMEDLEY.*

* This true history of the beginning of boarding-out in Leipzig is told by Professor Ingram, of Trinity College, Dublin, in an admirable paper on Pauper Schools, read before the Statistical and Social Society of Ireland, January 18, 1876.

BISHOP WILSON OF CALCUTTA.

PART I.

THE father of Daniel Wilson, fifth bishop of Calcutta, was a master silk-weaver in Spitalfields. He lived in a good, old-fashioned roomy house in Church Street, and there, on the 2nd of July, 1778, a son was born to him, who was afterwards named Daniel. The boy did not thrive well. He was naturally a sickly child, and the air of London did not agree with him; so he was put out to nurse in the country. This probably saved his life. Certainly, it strengthened his constitution, for after a few years he shook off the frail delicacy of his infancy, and developed into a "healthy, vigorous boy, with a firm step, buoyant spirits, and a handsome intellectual countenance." He was strong enough, at the age of seven, to be sent to school, and choice was then made of an academy in the

pleasant and healthy village of Eltham, in Kent. Having spent three years there, he was removed, for higher tuition, to a school at Hackney, superintended by the Rev. John Eyre, who at one time had been curate to the well-known Richard Cecil. There he pursued his studies up to the age of fourteen, when he was bound apprentice to a relative, William Wilson, who, like Daniel's father, was a silk manufacturer, in a large way of business, having his office in Milk Street, Cheapside.

So the future bishop entered into the rudimentary details of city life—visiting banks, presenting bills of exchange, and otherwise doing out-of-doors work (with an occasional excursion to the Chapter Coffee-house), which was at once pleasant and salutary. The

worthy master of the establishment was rather a strict man, exacting rigid obedience from all who served under him, and some of them rarely enjoyed the fresh air except at an open window. One said that he sometimes went three weeks without putting his hat on. It was well, therefore, for young Daniel that, being a relative of the master and greatly to be trusted, he was sent out from time to time to tread the streets of London. It was well, too, that, though the hours of business were long, he found time for intellectual exercises. He worked at Latin and French in his bedroom, and improved himself in English composition. He had no dislike to his present work, no desire to leave it, for there was something alluring in the future. He would certainly become rich. Civic honours might fall in his way. There were less likely things than that he should become sheriff, alderman, and in due course lord mayor of London, with a baronetcy, or a knighthood at the least, to celebrate the year of his mayoralty.

As to any idea of the ministry, all such thoughts were far away from him at this time. He was by no means a seriously-minded youth. Years afterwards he castigated himself with an exaggerated severity not at all uncommon with neophytes. He spoke of himself as the chief of sinners; but in reality he was neither better nor worse than the majority of striplings in the counting-houses of the great metropolis. Those were evil days for the rising generation. They had caught the contagion of scepticism and blasphemy from France, and their disputations were of the Age of Reason, unreasonable. In Milk Street, Cheapside, was a considerable gathering of presumptuous striplings, whose delight it was, in default of music halls, to spend their evenings in talking nonsense, which would have been lamentable if it had not been ludicrous. Daniel Wilson wrote down against himself that he had no faith and no understanding, that he never prayed, that he had vile thoughts and that he did vile things, and was altogether a castaway.

But in this career he was suddenly arrested by some happy words of one of his fellow-inmates. On the 9th of March, 1796, the usual disputations were going on in the warehouse, and Wilson was strenuously denying "the responsibility of mankind, on the supposition of absolute election, and the folly of all human exertions, where grace was held to be irresistible," when another young man observed that "God had appointed the end, He had also appointed the means." To this

young Wilson replied that "he had none of those feelings towards God which He required and approved." "Then pray for the feelings," was the prompt answer of his companion. The good advice was not thrown away. That night Daniel prayed, and there was an answer to his prayers, dimly discernible at the first, but not without "access of unexpected strength." The strength soon displayed itself in open action. He determined to seek the advice of one older and wiser than himself. To whom better could he go, in the first instance, than to his old tutor and friend, Mr. Eyre. So he wrote him a letter and paid him a visit, and received kindly and gentle encouragement from the good man, who regarded Daniel with something of paternal interest. But he was still dissatisfied with himself. He was too greedy of immediate results. He expected not only a prompt, but a full answer to his prayers. He had long been dead to all spiritual things, and now he looked for a sudden revival, or rather a new birth. The impatience and impetuosity of youth were upon him, and he had not taken thoroughly to heart the wise words of his fellow-servitor at the Milk Street warehouse. He expected the end to be worked out by means most intelligible to the finite, not in accordance with the inscrutable will of the Infinite.

In this state of dissatisfaction young Daniel Wilson sought further advice and guidance. He went to the Rev. John Newton, for many years the friend and companion of William Cowper at Olney, but then rector of St. Mary Woolnoth, London. That remarkable man, the story of whose life is a vivid romance, was not likely to discourage the impetuous youth, because his prayers had not yet, in the fullest sense, been answered by the almighty goodness. Newton had begun his career as a mariner and a slave-dealer, and his conversion had been slowly wrought out, with many interruptions and backslidings, much doubt and despondency, sometimes despair. When young Wilson called upon him, "he inculcated the salutary lesson of waiting patiently upon the Lord." "He told me," wrote the youth to his pious mother, "God could, no doubt, if He pleased, produce a full-grown oak in an instant on the most barren spot; but that such was not the ordinary working of his Providence. The acorn was first sown in the ground, and there was a secret operation going on for some time; and even when the sprout appeared above ground, if you were continually to be watching it, you would not

perceive its growth." This, and much more that Newton told him, he took sorely to heart. He went away cast down and oppressed, because he could not realise the fulness of the faith and love which he knew to be necessary to salvation.

The year passed on to its dreary close, and still Daniel Wilson complained that words could not express the abominations of his life, nor any self-exertions or human power extricate him from the sea of misery in which he was involved; so he determined to seek another interview with Mr. Newton. But the good man stuck to his old text—"There is a regular gradation of progress. 'Then shall we know, if we follow on to know the Lord.' I don't like folks who jump into comfort all at once. It is better to go on gradually. God lays the foundation in the heart, and the walls no sooner peep above ground than we want the roof clapped on; but that won't do."

All this was sufficiently intelligible. His head accepted it, but his heart rejected it. He dated his conversion, or rather the glimmerings of truth which were to lead the way to his conversion, from the 9th of March, 1796, but when the 9th of March, 1797, came round he was still sunk in despondency. He had not yet learnt to "wait upon the Lord." But God forgave his impatience, and when His good time came the dead heart began to live. There was a sudden burst of light, and he came forth as it were out of the darkness of the tomb, and all the cerements and grave-clothes of doubt and unbelief fell from him. In October, 1797, not without some misgivings, he came to the solemn resolution that he would take the sacrament of the Lord's Supper, at Mr. Eyre's chapel. When the time came, in fear and trembling, but afterwards with unspeakable comfort to himself, he approached the table of the holy communion and partook of the sacred elements. "Yesterday and to-day," he wrote on the 4th of October, "have been, I think, the happiest days of my life. The Lord shines so upon my soul that I cannot but love Him, and desire no longer to live to myself, but to Him. . . . I have felt great desires to go or do anything to spread the name of Jesus; and I have even wished, if it were the Lord's will, to go as a missionary to heathen lands." So the conversion of Daniel Wilson, apprentice, of Milk Street, Cheapside, was fully accomplished.

Still Daniel Wilson was but an apprentice, and he could not break through his articles without the consent of his father and

his master. The former was by no means pleased with these erratic desires on the part of a youth of nineteen, who, it was supposed, might any day backslide into the worldliness of the past. Daniel had a good reputation at the warehouse as a promising man of business;* and, with such connections, a competency, if not a fortune, was secured to him. In this dilemma, Mr. Eyre came forward with the proposal of a compromise. It was suggested that the question should be shelved for a year. This was accepted, but under the trial the old impatience broke out again. Sometimes he thought he was wrong in seeking man's advice at all, and then he resolved to seek more of it. So he went to the Rev. Rowland Hill, whose strong common-sense, clothed in brief incisive language, must have somewhat staggered the novice. When Daniel Wilson asked his instructor whether it was his duty to wait till he was out of his time, the great preacher of Surrey Chapel answered, "Yes, certainly; your time is not your own. By a mutual agreement, you have bound yourself for a certain number of years, and that obligation is superior to any other." Still Daniel did not relinquish the pursuit. There was another eminent Evangelical divine to be consulted, and, with his father's consent, Daniel had an interview with the Rev. Richard Cecil, of St. John's Chapel, Bedford Row. His reception of the youth was more encouraging, and his father consented that he should leave business and Milk Street behind him, and enter himself at St. Edmund's Hall, Oxford. So the apprentice developed into the undergraduate; and Mr. Cecil's curate, the Rev. Josiah Pratt, who lived in Doughty Street, near the Foundling Hospital, was selected to "coach" the young aspirant for holy orders.†

That was a very momentous period in the history of Evangelical Protestantism in England. The reader who is familiar with the religious biographies of that epoch must recognise many well-known names in the foregoing record of Daniel Wilson's conversion. There were masters in Israel in those days—men at whose feet the young blasphemers of the last decade of the eighteenth century, with newly awakened consciences, were eager to sit and listen. Not many years before Daniel Wilson carried his doubts, his conflicts, and his sorrows to

* He himself strongly denied this. He affirmed that there was not the making of a man of business in him.

† For the foregoing information I am indebted to the "Life of Bishop Wilson," written by his son-in-law, Mr. Bateman, a work of great interest and value, executed with much loving care and conscientiousness.

John Newton, another young man, destined also to be a shining light in India, had sought inspiration from the same human source. A lawyer's clerk, named Claudius Buchanan, far sunk in impiety and immorality, had been roused from the sleep of apathy by the wise and earnest words of the rector of St. Mary's, Woolnoth. Buchanan wrote to him, but subscribed no name to his letter. So Newton, feeling sure that he would be present, addressed the nameless stranger from the pulpit, and adjured him to come and lay bare his hidden griefs to his pastor. The invitation was joyfully accepted. The result is known. It does not belong to this narrative to dwell upon it; and Newton—great as he was, and perhaps better known to the present generation than any of his holy contemporaries—(for many who but dimly know the story of his own life, are familiar with him as *pars magna* of the life of Cowper at Olney) was but one of many good men who stemmed the tide of that fierce sea of infidelity and blasphemy which swept over us from the opposite shores of France.

But it was not only from the pulpit, it was not only by men with an accepted mission to declare glad tidings to unbelievers and to waverers, that this great work was accomplished. The Newtons, the Scotts, the Cecils, the Simeons, the Hills, and the Fullers were powerful in their individual might, to proclaim the gospel of salvation; but they had not the means to send the glorious message forth to the uttermost corners of the earth. One thing was wanting to them—that with which, for their own personal ends, they might well afford to despise; they wanted money. Some of them at least made money, but they neither handled nor enjoyed it. The profits of Scott's Commentary might have subsidised a mission to the heathen; but it went into the pockets of rogues.* The great cause, however, did not need pecuniary succours earned by the literary industry of poorly-paid preachers. The privilege was granted to men whom God had called to the performance of secular duties, but in whom the divine afflatus was as cogent as in the breasts of Whitefield and Newton. There were bankers and merchants in the City of London, with their suburban mansions or

villas in Clapham or Battersea, not less zealous than the Evangelical priesthood, who were doing such great things for the gospel of Christ. Conspicuous among these were the Thorntons, Charles Grant the elder, John Shore (afterwards Lord Teignmouth), and Zachary Macaulay. These names are too well known to render it necessary that I should dwell upon the characters and careers of those who conferred such honour upon them.† This is merely a digression, but it is a serviceable, if not a necessary one; for we cannot rightly understand the progress of the great Evangelical work that was going on at the close of the eighteenth century and the commencement of the nineteenth, without taking full account of the participation in these pious labours of the large-hearted and full-brained laymen who contributed from their ample material and intellectual resources towards the success of the great enterprise.

Daniel Wilson went to college. In November, 1798, he went into "residence" at St. Edmund's Hall, Oxford. There was not much that was eventful, or in any way remarkable in his university career. Oxford was more tranquil than Cambridge—more decorous, more frigid and formal. It had not been warmed by the enthusiastic, demonstrative Evangelism of such men as Charles Simeon. As an instance of the temperature of Oxford Christianity at the time of Daniel Wilson's residence, the following is given in Mr. Bateman's book:—"A most accomplished member of St. John's, an excellent scholar, and one who was deemed a model of an undergraduate of those days, not only never read his (a) Bible, but did not possess one. Being remonstrated with by a friend, his rejoinder was, 'How can I help it? Do you think that I could by any possibility go into Parker's (the bookseller's) shop, and ask for a Bible?'"

But there seems to have been a better state of things in the obscure halls than in the prominent colleges; and Daniel Wilson was not wholly without society that was pleasing to him. He toiled on bravely at his academical studies, but he never became a great scholar, as scholarly greatness was interpreted in those days. He could not have written a dissertation on the "Digamma;" but he gained a prize for English prose in Heber's year,† and the subject of his essay

* It is related on the authority of his son, that when the commentator investigated his accounts, he found that nearly £400,000 had been paid over the counter to his publishers on account of Mr. Scott's religious publications, but that the author himself derived from them, for a time, an annual income of £37, and was eventually involved in a debt of £1,200. In this embarrassment Simeon came to his assistance with a remittance of £500, and others followed his example until the debt was liquidated.—See Sir James Stephen's *Ecclesiastical Essays*, article "The Evangelical Succession."

* See Sir James Stephen's admirable paper on "The Clapham Sect," a fitting sequel to that on the "Evangelical Succession."

† The year of Heber's prize poem on "Palestine," one of the few college exercises of this kind still remembered.

was "Common Sense." Thirty or forty years afterwards I often heard it said, that Bishop Wilson had many great and good qualities, but that common sense was not one of them. I may speak of this shortly. No one was more surprised than Wilson himself at his success; and when it came he was troubled in his mind greatly, because he had to read aloud his essay in the theatre on Commemoration Day. But when the time came, the burden of his fears fell from him. He delivered his essay with considerable effect, and was received with general applause. When he descended, Reginald Heber took his place on the rostrum. Years afterwards, Daniel Wilson, referring to that memorable day, said, "Is it not a singular coincidence that Heber, my revered, able, and pious predecessor, delivered his poem on 'Palestine' on the very day that I delivered my English prose essay on 'Common Sense'?" I well remember, as I came down from the rostrum, seeing Heber, who sat immediately behind, testifying his applause in the kindest manner, though I never made his acquaintance till 1812, when Mr. Thornton introduced him to me at St. John's Chapel, Bedford Row." So Daniel Wilson gained one of the university prizes, took his degree, first as bachelor (1802), and then as master of arts (1804), and never took his name off the college books.

But in the meanwhile he had been ordained. He had maintained his correspondence with the Rev. Mr. Cecil, who was then rector of Chobham, in Surrey. The living was in the gift of Mr. Thornton. It was of no great value, and it was presented to that eminent divine as a sort of rural supplement to his higher charge of the chapel in John Street. Perhaps, of all the Evangelical ministers whom Wilson had the privilege of knowing in his youth, Cecil was the one whom he most loved, and to whom he felt himself most indebted. He had strong feelings of filial reverence towards him, and Cecil upon his part regarded Daniel Wilson and his career with almost parental emotion. What could be more natural than that the rector of Chobham should desire to have young Wilson as his curate? Cecil was growing old. The strong spirit within him was wearing him out. He often preached with eloquent fervour, whilst suffering acute pains which would have driven most men to their beds. He knew that the frail flesh was failing him, and he was eager to find among the rising generation of Evangelical ministers one who might first assist him in his

work, and afterwards take the whole burden on himself. His mantle must soon be surrendered to another. Who so fit to receive it as the sometime apprentice of Milk Street? Truly, it would be great gain to them both that they should enter into close communion with one another. So Daniel Wilson, then twenty-two years of age, went down to Chobham, and sat at the feet of that Gamaliel, gaining wisdom every day.

The 20th of September, 1801, was the day of his ordination. He entered at once on the duties of the ministry. His first sermon was on the text, "Him that cometh to me, I will in nowise cast out." It was well received by the congregation. The young preacher had wisely resolved not to imitate the manner of his master. Cecil had gone up to London, to tend his flock in Bedford Row, and the whole duty of the two churches in Surrey was cast upon him. Preaching was but a part of it; and a small part, for he complained that he had but little time in which to prepare his sermons amidst all the house-to-house visiting that pressed so heavily upon him. When he went home he was weary and languid, and he had often to do battle with himself in resistance of his natural inclination to rest. It is well that those who argue against brain-working, *invitâ Minervâ*, and who urge that what is badly done is worse than what is not done at all, often mere excuses for idleness, should ponder well what young Daniel Wilson wrote at this time. "Necessity draws out the powers of the mind and brings its riches to the light. The most celebrated men have excelled others by the force of will. Compulsion must be used. The mind must be urged. The faculties must be exerted. Nothing must be yielded to delay, fastidiousness, or languor. The doors must be beaten in and broken down if they will not open." Some will say that this is "killing work;" perhaps it may be in some cases; but Daniel Wilson worked, willingly or unwillingly, until death took him at the ripe age of fourscore.

In this rural work the young minister was interrupted by what, at some time or other, interrupts most of us—he fell in love and thought of being married. He had not to go far in search of a bride. He found one within the immediate circle of his own kindred. He married his cousin, Anne Wilson, on the 23rd of November, 1803.

After this event, Daniel Wilson's life was spent for some years, partly in Oxford, where he became assistant tutor, at St. Edmund's

Hall, and afterwards sole tutor and Vice-Principal, and partly in the neighbouring parish at Merton, with which his family were connected, and where he officiated as curate on Sundays. This was the quietest, least eventful part of his career. It lasted till 1809, when the way was opened to him for higher duties and more stirring work.

It is not to be doubted that during his incumbency of St. John's Chapel his powers as a preacher were at their height. He had shaken off the diffidence of youth, and the garrulity of age had not yet come upon him. He had no parish work—no house-to-house visitations among the poor, whose "short and simple annals" were to be studied and turned to account in his rural ministrations. The pulpit, if not everything, was now the first thing to him. He had a highly intellectual audience; and it was necessary that he should preach up to their standard. Among those who assembled to hear him were Charles Grant the elder, and his two sons, Charles and Robert, both on the high road to distinction; John Thornton and his sons; Zachary Macaulay and his son Thomas, the great historian; William Wilberforce and his son Samuel, afterwards the much-venerated and now the much-lamented Bishop of Winchester; and Mr., afterwards Sir James, Stephen. The chapel was always quite full, and many were compelled to find sitting or standing room elsewhere than in the pews, or to take their departure. That his discourse, at that time, was wonderfully impressive is not to be doubted. He was in the prime of his life. His physical powers had in nowise begun to fail him, and the familiarities which at a later period were apparent in his discourses, did not then raise the smiles of his audience. With an earnestness of manner and a solemnity of utterance, within due bounds and graduated to suit the occasion, he preached Christ Crucified to friends and strangers, and sent no man empty away. All listened, some perhaps with distaste at first, but they soon came to love what they had hated. Mr. Bateman relates, that a young lawyer hearing him for the first time said, "I will never hear that Daniel Wilson again." But he did hear him again, and said, "I will never hear any one but Daniel Wilson, if I can help it." And from that time he became a regular attendant at the chapel, although he applied in vain for a private seat. The preacher's sermons came from his heart, but there was a deal of head-work in them. He had been a hard student

for many years, and he had mastered the old divines in many languages, no less than the works of those evangelical teachers whom he more immediately succeeded. But he made no display of his learning. In his sermon-notes there were profuse references to his books, but he only sparingly used them. No higher praise can be bestowed upon him than the admission that he proved himself in all things a worthy successor of Cecil.

But although Daniel Wilson, whilst incumbent of the John Street Chapel, had no parochial duties to perform, he was always accessible to those who desired to consult him,* and he gave largely both of his strength and of his time to more distant objects of pursuit in the cause of his beloved Master. He toiled assiduously in support of some of those admirable Christian societies for the promotion of the spread of the Gospel at home and abroad. In furtherance of those great designs, he visited all parts of the country, crossed the Channel to Guernsey and Jersey (nearly dying of sea-sickness on his way), and thence descended upon the coast of France. He was never tired, whilst he was "about his Father's work." But, strong man as he was, the labours which he attempted were too much for him, and he broke down under the burden. He paid the penalty, which all must pay, who ignore the weakness of humanity, and disregard the promptings of nature. In 1821, and again in the following years, sickness fell heavily upon him. He was utterly prostrated by a succession of painful ailments, and was well-nigh lost to the world for ever. It need not be said that he bore the pain and weakness that prostrated him, bravely and meekly, and with all reverential submission to the fatherly hand that had chastised him. But all strenuous actors striving to the utmost to do their little good on the earth, chafe under the idleness imposed upon them, more than they do under their bodily anguish. Not without reason Wilson believed that he was in the valley of the "Shadow of Death." But God had more uses yet to which to put that labourer in his vineyard.

JOHN W. KAYE.

* He was somewhat impatient, however, of mere visitors, even though they were his dear friends. His old friend, Mr. Basil Woodd, used to say of him, "When I go to see Mr. Wilson, before I have well settled myself in my chair, I hear him say, 'Good-bye, dear Basil Woodd; here is your hat, and here is your umbrella.'" "No doubt," adds his biographer, "affection was in some degree checked, and a certain kinder influence forfeited by this, and some persons may be disposed to blame it; but the man, who himself fills a public post, with unceasing engagements and every hour occupied, will not be inclined to throw the first stone." Nothing can be more true.

DEATH AND BURIAL.

WE are all conscious of the common instinct which gives a peculiar touch of solemnity to our voice and words when we begin to speak of anything connected with Death. There are abundant reasons why the thought of death should awaken the reverence of *feeling* in our hearts. But it appears to me that the subject is one which ought to be treated with *intellectual* reverence also. The mystery in which it is involved should naturally impose a chastened tone of reserve and moderation upon our language. The levity of dogmatism is singularly out of place in dealing with the problems into which death enters. It is a province, certainly, in which we look for the earnest affirmations of faith : but faith draws its assurances from spiritual facts which do not warrant it in laying down confident definitions about processes belonging to the physical order ; and the great and obvious difficulties which confront all attempts to explain the physical nature and consequences of death should warn our faith to keep to the ground on which it is strong, and to occupy itself, according to its proper nature, first and mainly with spiritual things.

I hope that neither form of reverence will be wanting in the observations I am about to make on the death of the body and some matters relating to it.

One of the most natural thoughts about the act of dying is that it resembles falling asleep. Death and Sleep have been called brothers. "To die,—to sleep ;—no more." All nations—all men, from our Lord downwards—have applied to death the terms of sleep. "Our friend Lazarus sleepeth ; but I go, that I may awake him out of sleep." The word cemetery, which has to some ears, perhaps, a somewhat hard and legal sound, had its origin in this resemblance. It means a "sleeping-place."

But this can only be the thought of those who contemplate death in its earliest stage. We need not introduce here the almost wearisome name of science. The most unscientific of mankind know what becomes of the body after death. The body does not awake in renewed vigour from the sleep of death. It goes on to perish. Sooner or later it mixes itself undistinguishably with the earth around it. If an ancient disused cemetery were examined, no sleeping human form, nothing approaching to such a form, would be found in it. These bodies of ours are manifestly not eternal ; they are a vesture not even to be called durable.

A little tincture of science informs us that even whilst we are alive our bodies are not durable. A double process of creation and waste is continually going on in them. Every day we are parting with something from our tissues, and adding something to them. It is roughly calculated that in seven years our bodies are entirely renewed. The body of seven years ago has actually perished, and the existing body has grown in seven years from nothing, the new gradually ousting the old from our visible frames. So that the complete dissolution of the body after death may be regarded as only the continuance of that process of waste which is one of the means by which the body is kept alive.

Although, therefore, at first sight, to die may seem like falling asleep, the resemblance of death to sleep very quickly disappears. If we have at first thought of the living person as continuing to exist after death in a dormant state, the subsequent history of the body may naturally lead us to say that appearances deceived us, that instead of sleeping he has perished ; decay has made him its victim.

This is not, however, what we do say. The *body* is evidently mortal, in the fullest sense of mortality ; but we believe *man* to be immortal. We are thus constrained to distinguish between a man and his decaying body. There are powerful instincts in human nature which refuse to admit that a man is nothing more than his body of flesh and blood. The human race in general has believed in immortality ; and, as this faith has been prompted by the more spiritual affections, we do not wonder to observe that the belief in immortality, whilst it has been refined, has been also deepened and strengthened, with the moral growth of humanity. Christ, we Christians say, has shed light on life and immortality. He has not done so by explaining the physical conditions of the life after death. The light has come, partly from his own triumph over the death to which He yielded on the cross, but still more from the whole revelation which He has given us of the Father's nature and of our relation to the Father. As believers in God and Christ, we believe, as a matter of course, in immortality. The weight of physical argument might possibly appear to us to be on the whole against immortality. Metaphysical argument in its favour shares the precariousness of metaphysics in general, and many will shrink from building anything substantial

upon it. But the revelation of God which appeals to our faith and hope and love, which makes us new creatures and gives us a new life, which exalts us above subjection to the world of change and decay, which claims us with a force to which we gladly surrender ourselves as belonging to an eternal realm—this gives us the firm assurance of an existence over which death has no power and to which it cannot put an end.

It is from this Christian consciousness, that our belief in immortality will draw its proper nourishment. The Christian who lifts up his heart in prayer to the Father, and grows in the contemplation and knowledge of Jesus Christ, and exercises himself in the experiences of the Christian life, will not be induced, at the summons of a difficulty or of twenty difficulties, to pronounce all this to be a delusion. If any one believes man to be merely an animal, capable of knowing nothing above himself, nothing in front of the present stage, having his only relations with the animal races of which he happens to be the most developed, I should not attempt to argue the question of immortality with him. I should not attempt, nor greatly desire, to convince him that man's existence, such as he conceives it to be, will not be cut short by the death of the body. On the other hand, the Christian to whom the gospel of heavenly love and spiritual life has commended itself as true will be prepared to find the flesh putting difficulties in his way at every step, and will hold to immortality, not for physical reasons, but as bound up with his faith in Christ and in God. Let God be true, and every man a liar. Many mistakes may be made, by believers and by unbelievers, about the nature of life and the meaning of death; but God will know how to preserve his children, and to carry them onwards towards those attainments of knowledge and blessedness by the promise of which He feeds their hopes.

But, our faith in immortality being thus spiritual, we ought not to pledge it to physical ideas which are proved to be untenable. When we have learnt that our bodies of flesh and blood are not stable, even whilst we live, for an hour, and that what happens to be the body at the moment of death quickly passes into other forms in which it mingles with the soil and the air, and enters into vegetation, and through the air and vegetation into other animal bodies, our conclusion ought to be that we must not lodge our hopes of immortality in the body of corruption. It is made clear to us by these

observations that the immortal man does not reside in these mortal remains. We ought not to allow the image of sleep to mislead us into thinking of the immortal being as resting under any modification in the ground to which the remains have been committed.

Let us not be too scrupulous about phrases. The common language of mankind, the language, too, of the Bible and of our devotional books, contains expressions concerning death and the condition of the departed, which, if literally interpreted, would identify the living person with the remains decaying in the grave. Such expressions can hardly be avoided. Let us not be over-careful to reject them; but let us also hold ourselves independent of them.

The truth appears to be that the living person sheds off the body in which he goes through the change called death as completely and finally as he has shed off parts and particles of his body throughout his life. How the living person is to be conceived of apart from the form of flesh and blood through which his fellow-mortals have known him, is one of those questions on which a spiritual faith ought not to be too eager to pronounce with confidence. Let us always remember how little we can know of a world and state of existence different from those by which all our conceptions have been moulded. The idea which seems to me to have most to commend it is that the living being who deserts the tenement of clay is not strictly incorporeal. Invisible he is, certainly, and not subject to the cognizance of any of our senses. But he may still be clothed with some unknown kind of form in which living powers are held together. And the word "soul" may be so understood as not to exclude from its meaning such an invisible imperceptible body. But how is either our imagination, or our language, to put into intelligible shape the inhabitant of another world? No wonder if we fail in the attempt. The being whom it is important to us to know as surviving death is not he who occupies space or who puts forth modifying energy upon the element surrounding him, but he who loves and fears and hopes and knows, who enjoys and suffers.

On this very account, however, it is important that we should distinctly separate in our minds the spiritual and immortal being who survives from the body surrendered to decay. This it is quite possible, though not altogether easy, to do. The intermediate course which has found favour with certain expositors of these subjects, of assuming that

some sort of indestructible seed resides in some part of the mortal remains, from which a body will hereafter be made to grow, has not much to recommend it. This supposed physical seed is imaginary. Science knows nothing of it. No one can suggest where, or what, it is. Some expressions of St. Paul, which may appear at first sight to countenance it, ought probably to be otherwise interpreted. The supposition rather introduces than removes difficulties. It seems to me far wiser to think of the mortal remains as having their relation in the past only, and not at all in the future, with the living person.

Those mortal remains, then, which we carry to the grave—what are they? They are the most sacred possible relics of the living friend. Relics only, more and more manifestly as time goes on shown to be simply cast off to perish. But sacred, at first, beyond appreciation. For at first, as I said, they are to our eyes the very person. Nature will at that moment hardly allow us to make the distinction which afterwards becomes so certain.

Those who thus think of the body will naturally be indifferent about the fate of their own bodies after death, so far as *they themselves* are concerned. Many persons have in fact attained to this indifference. Any care they may have about the future disposal of their bodies will have reference to the feelings of their surviving friends, and not to themselves.

But indifference about our own mortal remains is by no means the same quality as indifference about the mortal remains of our fellows. The latter is stamped by the general opinion of mankind as something brutal. No tenderness of reverence can well be excessive in the treatment of the forms which have been within a few hours the vehicles of intelligence and love. There is a transition period between life and corruption for which nature vindicates its due regard—a regard which neither reason nor Christianity condemns. The truly Christian mind should, I think, in the meanwhile be weaning itself deliberately and in faith from the associations which identify the living departed with the tenant of the coffin or the grave. It is not wrong to pour out upon the newly breathless form a passion of love and sorrow; it *is* wrong, or at the best a mistake, to persist in thinking of the grave as the permanent residence of a dormant immortal being.

A churchyard or cemetery is not, then, if

we think of it rightly, a place where sleeping Christians are taking together their temporary rest. It is a place where the flesh and blood which were once the external forms of living Christians are reverently and tenderly laid, that they may moulder in the dust and render again to the soil the constituents which were formerly taken from it. Our funeral ceremonies and language of burial are influenced in some degree by the inevitable feelings of that transition-period to which I have referred. We do not feel much temptation to identify the dust in a coffin five hundred years old as the man whose body it represents. But it is almost a matter of course that, before the lines of life have been swept away by decay's effacing fingers, we should think we are following the very loved one himself to his grave. So the burying-place, whether churchyard or cemetery, will certainly be sacred in the eyes of those who have any reverence or tenderness in their natures. But, I repeat, it is a place of decaying remains, not a home of living members of the Church. And it may be that our feeling towards it will be in some respects modified through our so regarding it. The remembrance of the dead is a noble and elevating and purifying mental act, but it ought not to be identified with a superstitious worship of decaying elements, or with a fanatical religion of the churchyard. What we chiefly want with regard to burials is protection of the mourners and their natural affections, and protection also of the general sentiment of reverence towards whatever represents humanity and speaks of death.

It is from the point of view which I am now commending—in the contemplation, I mean, of lifeless bodies as relics due to corruption, but having an inexpressible sacredness immediately after death to the survivors—that we may wisely approach such questions as have been discussed within the last year or two about the best mode of disposing of these remains. We have been compelled to take note of the fact that there are serious evils to the living, and many inevitable offences to reverent feeling, in crowded churchyards and cemeteries. The old method of consuming bodies by burning has been recalled and recommended. It has been urged on the other hand that interment in the ground was proved to be a process more congenial to Christian sentiment by the fact that the Christian Church substituted this latter custom for the burning which was in use

amongst the heathen. If the reason was that the Christians thought that interment in the ground would keep the constituent elements of the body together so that they might be more conveniently recombined for the resurrection, that, we must say unhesitatingly, was a mistake; and it was a mistake difficult to understand in a society which often saw its most honoured members destroyed by deaths which permitted no sepulture. I do not know how far this notion prevailed and helped to supersede the custom of burning; certainly it ought not to be allowed to influence the practice of those who know better than to entertain it. It seems to me that the question of interment or burning is not one to be disposed of by any principle of religion; it is one to be determined by sentiment and the public good. Reverence, we must bear in mind, is closely interwoven with *custom*; there is no feeling that is so conservative. And therefore a very strong case ought to be made out, before we are constrained to adopt so great a change as that which would replace interment by burning. It is evident that the strong case has not yet been made out; we may still retain for the present our traditional customs of burial. And we know well that, however we may theorize, when the sad hour of bereavement arrives for each, we shrink from adopting any novel practice which may be thought fanciful, or which may require the exertion of inventive thought in arrangement and execution.

There are some minor points, however, on which it is desirable that we should be on our guard against the tyranny of a fashion created by false or exaggerated sentiment.

(1) It is much to be desired that the funeral should take place with as little delay as possible after a death. The notion that respect is shown to the departed by postponing the funeral is a foolish and unworthy one. Instructed Christians should lean to the side of shortening the interval rather than of lengthening it. I know what the pleading of affection and grief will be at such a time. And I would say to the mourners who cannot bear the thought of parting with their dead, Do not let the feeling cling to you longer than you can help, that in cherishing those mortal remains you are keeping the true loved one nearer to you. No, your fellowship must henceforth be in

the region of the spirit, of love and memory and aspiration.

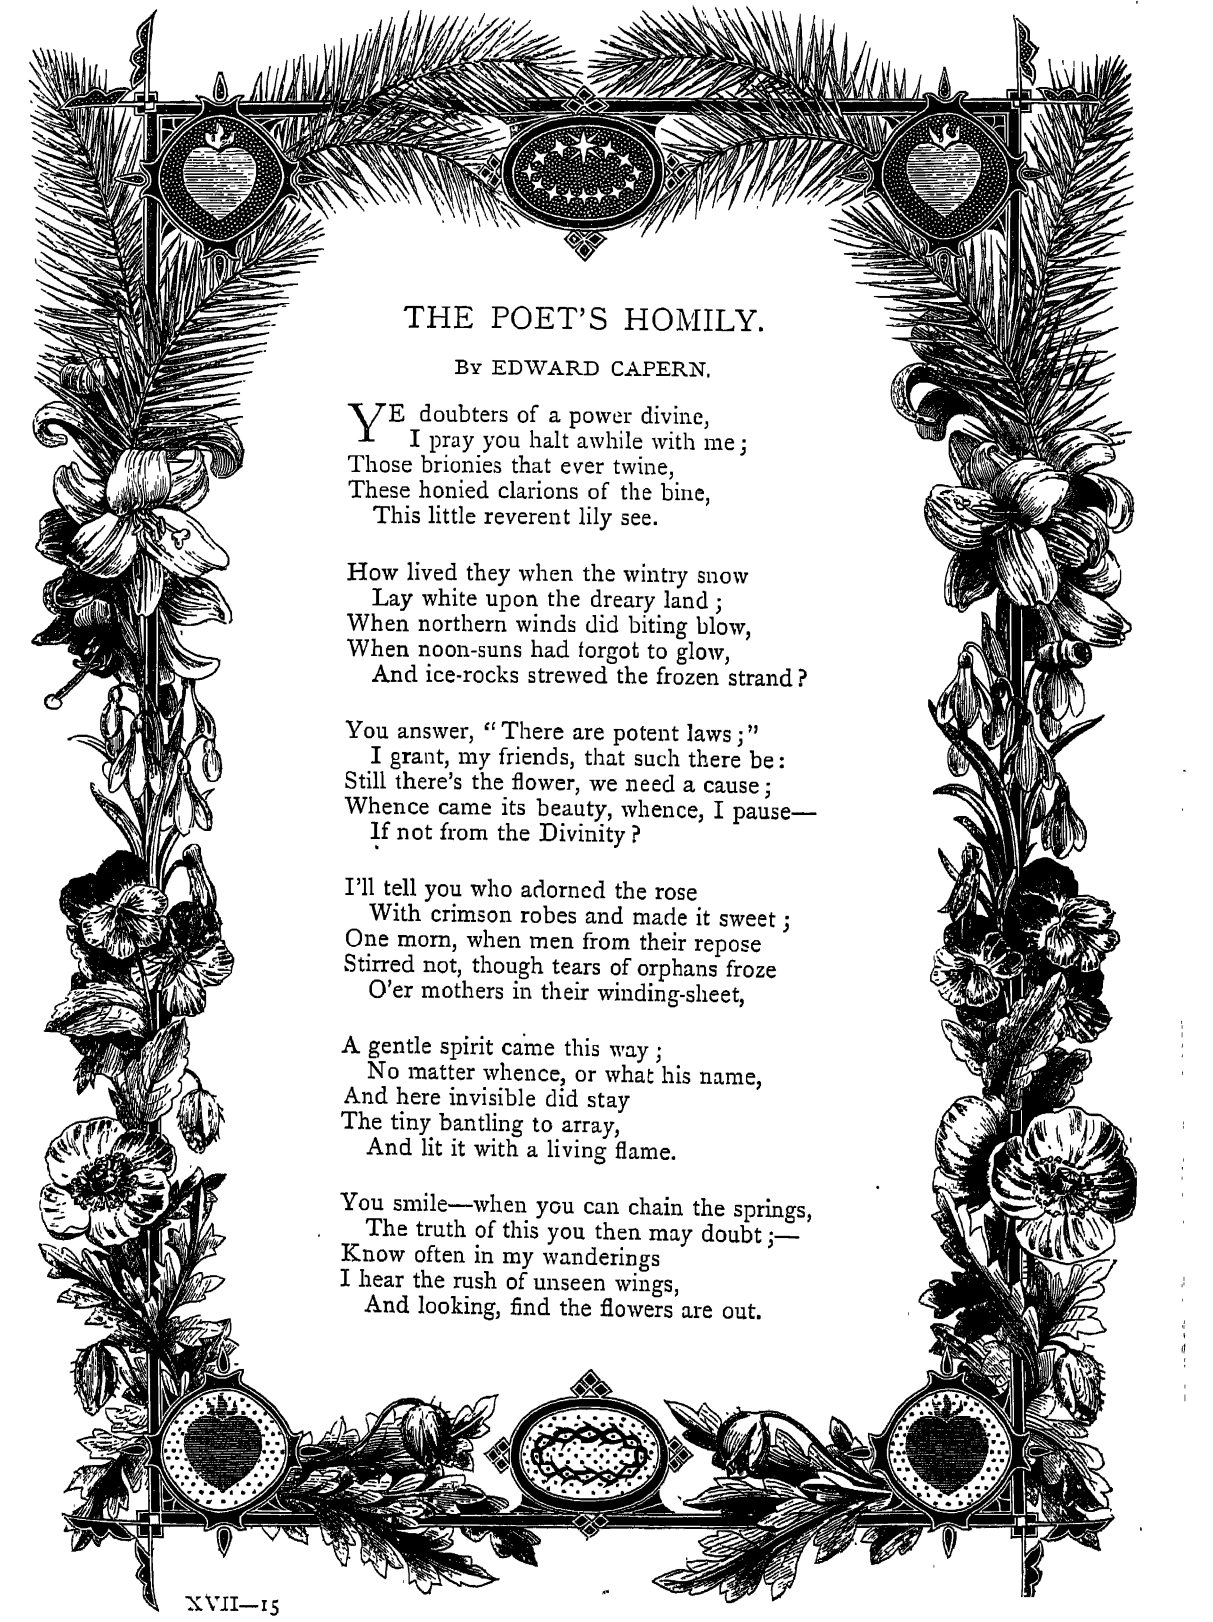

(2) Again, it is a false sentiment that seeks to prolong by artificial means the preservation of the body after death. I believe that in America it is not uncommon to embalm the dead. I hope that nothing of the kind will be introduced into this country. But it will be useful to fix firmly in our minds the principle that the decaying elements of the human body belong to the earth, and should be allowed to mingle as quickly as they will with what may turn them again into a ministration of life.

(3) The thought of a funeral brings to the mind the recognised symbols of grief for the departed, and I cannot refrain from briefly deprecating usages which seek to envelop a death in costly and oppressive gloom. Let every one remember that the pomp of a funeral, the crape and the black, cannot possibly be any measure of inward grief. They can be, and are, purchased to order, by those who think it seemly to grieve, as well as by those who really grieve. Here, again, I would urge that we should lean to the side of simplicity and moderation rather than of extravagance. External mourning is a matter of conventional decorum rather than of inward personal feeling.

And, however deep the feeling may be, Christian symbols of mourning ought not to indicate a sorrow as of those who have no hope. It is the glory of Christian faith to correct the mere impulsive complainings of nature by the suggestions of hope and the realities of spiritual communion. We are not children of death or of gloom; but rather of light and of life. It is not desirable, I think, that the shadow of death should be constantly resting upon our minds, and that we should be too often lingering in imagination beside the death-bed and the open grave. Death, indeed, and its awful associations are things of which we must necessarily take account, and on which it is wise for those who are well and happy sometimes to dwell. But our calling bids us live with our eyes not turned downwards to the dark and to the pit, but upwards to the eternal light. It invites us to breathe not the depressing exhalations of decay, but the wholesome and invigorating air of thankfulness and hope.

J. LLEWELYN DAVIES.

THE POET'S HOMILY.

By EDWARD CAPERN.

YE doubters of a power divine,
I pray you halt awhile with me ;
Those brionies that ever twine,
These honied clarions of the bine,
This little reverent lily see.

How lived they when the wintry snow
Lay white upon the dreary land ;
When northern winds did biting blow,
When noon-suns had forgot to glow,
And ice-rocks strewed the frozen strand ?

You answer, " There are potent laws ;"
I grant, my friends, that such there be :
Still there's the flower, we need a cause ;
Whence came its beauty, whence, I pause—
If not from the Divinity ?

I'll tell you who adorned the rose
With crimson robes and made it sweet ;
One morn, when men from their repose
Stirred not, though tears of orphans froze
O'er mothers in their winding-sheet,

A gentle spirit came this way ;
No matter whence, or what his name,
And here invisible did stay
The tiny bantling to array,
And lit it with a living flame.

You smile—when you can chain the springs,
The truth of this you then may doubt ;—
Know often in my wanderings
I hear the rush of unseen wings,
And looking, find the flowers are out.

NEITHER RICHES NOR POVERTY.

"COUNT your blessings and then count your own short-comings," sounds simple advice.

But we are all so much more apt to notice the good things we miss than the bad ones which we escape. To give a quaint illustration,—We may think it hard that we have not a crusader for our forefather, but we forget to rejoice that our humble name is not Blood, or Flesh, or Death, or Stout, or anything else which would follow us with an ugly picture wherever we go, instead of the wholesome association of the village or calling from which we derive our own un-aristocratic names. And yet in their turn the people with the queerest names have only to remember that it needs but an added greatness to take all the whimsicalness from them, and make them honourable henceforth for all generations. The sound of "Dickens" might have raised a smile fifty years ago. It is to be doubted whether its comical possibilities ever strike anybody now.

The very name of Dickens makes us remember that on his list of blessings he scarcely counted the hardship and strange experiences of his younger days. And yet nobody else can fail to see that to those experiences, cut deep on a sensitive nature, he owes his peculiar success and popularity. And this raises the question, What are blessings?

The world has the evil habit of glibly summing up wealth and rank, genius, beauty, youth, and health in that category. But is not the word blessing derived from the Anglo-Saxon word *bletsain*, "to consecrate?" It is not any thing, but the thing's use, which is the blessing. A man is not blessed unless he is a consecrated man. With our Saxon ancestors the "blessed" was what was consecrated to higher purposes than its own existence. The blessed land was that set apart for the profit of God's house and God's poor. And so the blessed thought is that which a heart was broken to set free for the healing of other hearts—the blessed life is that which is given for the world. Therefore everything that "consecrates" a man is a blessing, and whatever fails to do so is simply a curse, though either may be shame and pain and poverty, or glory and praise and wealth. So it becomes false in thought to say that such an one was blessed with wealth and rank and talent, but wasted them

all. If he wasted them, they were not blessings. They were like coronation oil poured in a salad-dish—the salad is but the worse. The poor creature got a task too high for him; he made discord, just as might a pupil who attempted one of Beethoven's sonatas when he was fit only for the tunes in the exercise-book. For him the true blessings might have been poverty, obscurity, and dulness—narrow limits where he could not stray far, and thorny hedges to prick him back.

Can we call a man blessed with wealth, while he is so unconsecrated by it that he makes even his very almsgiving but an added instrument of his vanity and malice? Or can we consider those consecrated who seem to think they are fulfilling a duty towards heaven when they are merely husbanding their material resources for their own benefit, because they say "it is easier to be good when one is well off?" If there were any truth in this delusion, then that would be the best reason for giving up wealth utterly. When it is bad manners anywhere to elbow others aside to get a good place for oneself, it certainly cannot be the spirit in which to approach the gates of heaven. But the upward road is only a narrow foot-path, and if we are not climbing it by the stress of our own muscles, and perhaps marking our steps with our own blood, we shall find we have mistaken the way.

When the rich young man whom Jesus looked upon and loved answered that he had kept the law which He propounded to him, what did Jesus mean by his following exhortation, "to sell all that he had and give to the poor?" Commentators have puzzled themselves over that advice. Those of a school now happily nearly obsolete have supposed that Jesus wanted to "catch" him in his "satisfied self-righteousness." Is not the suspicion of any self-righteousness an unwarrantable one? Some of us write "spiritual significations" over the ancient history till it loses all its naturalness and beauty. In those days people meant what they said, not something else wrapped in words to hide it. When Paul called himself "the chief of sinners," he simply said so because he had been chief in persecuting. He had a distinct meaning for his words; he was not hazily accusing himself of spiritual murders and adulteries, as some will, who yet resent any simple accusa-

tion of sleeping late in the morning or thinking too much about money. Let us remember that Jesus prefaced his list of moral obligations by gently setting aside the courteous word with which the youth addressed him, and said, "There is none good but one, that is God," and it is after the young man's simple declaration that he had kept these laws, that it is added, "And Jesus, beholding him, loved him." Yet certainly if there was one thing least likely to attract the love of those far-seeing eyes, it was self-deception or hypocrisy. We hope that there are thousands among us to-day, in our parks and parlours, who could look straight into the most searching eyes and say, "All these things have I observed from my youth up." And from such lives, lifted by very nature above the coarser attractions of the life that now is, we think will always come the most eager asking of the great question, "What shall I do that I may inherit eternal life?"

Others have skimmed over the difficulty by arguing that this was a special counsel given for a special state of society. They are very strong on external unlikeness, forgetting that human nature and human needs, in their widest divergences, are much more alike than they are different.

Others, again, dwell with undue emphasis on the phrase, "them which trust in riches," forgetting that it only occurs in Mark's account, and that the Sinaitic and Vatican versions also omit it there! (How many a subtle discourse has had its text ruthlessly knocked off by that remorseless Tauchnitz edition, even without taking into consideration all its suggested possibilities!)

Here and there we find people with dreamy eyes and soft silken hair, who have no doubt of the meaning of these words of Jesus, who will go off into rapture over this one who gave up thousands that he might enter such a church or such a religious order, or that one who gave his whole fortune for some good work. Perhaps they have even done something in that line themselves. But whether or not, we love them. They have a spark of the true fire—though they still think that God's service claims rather "theirs than them." We love them so well, and can sympathize with them so warmly, that it is only by a terrible effort and a great self-sacrifice that we jar them by inquiring whether the priest did as much good inside the church as he might have done outside it, or whether the number of foundlings did not increase after the foundling hospital was built!

Others, who can scarcely be called commentators on the Bible, have this incident in their minds when they express an opinion that some of the teaching of Jesus Christ is impracticable in such a world as this; and this gives such an uncomfortable hint of make-believe, that one even turns with a sense of relief and reality to those who, unable to reconcile any of these readings with their knowledge of the welfare of things as they are, boldly say that the deepest influence in this world was gained by one who meant well, but did not know what he was talking about, and that Jeremy Bentham is a safer guide than Jesus.

If we would only treat the Testament story with the same calm fairness we should show to any other—if we would remember that the oldest Gospel can scarcely have been a contemporary short-hand report, but a memory inspired by faith and love—if we would take the significant hint that both Matthew and Luke omit the phrase "take up the cross," and that the ancient Sinaitic and Vatican versions omit the same words even from the record of Mark, and that in Luke's account our own English translators vary the word "give" by that of "distribute" (to part asunder)—if we would read each of Jesus' counsels in the light of all the rest, some of us might be saved from clinging to torn flags as if they alone bore his insignia, and some of us might be saved from casting away every banner bearing his inscription, in the belief that the moth is already in it, though decay may not yet appear.

It is quite possible that this young oriental ruler's wealth consisted of property whose accumulation was utterly useless, except for personal pomp and pride. Pearls of great price, richly-wrought robes, piled up beyond all the uses of love and beauty, served no purpose, except to tempt the thief and harbour the moth. There is nothing in any of Jesus' teaching to make it just or natural for us to suppose that He would have advised any man to sell his fields where labourers earned their honest wage, under such kindly care and watchfulness as Boaz exercised, that he might give its proceeds to beggars who might work but would not. Judas once got a plain rebuke for canting about "the poor," as if charity had no other form than its lowest and most perilous one of almsgiving.

"All that thou hast"—the three evangelists substantially agree on that phrase; the ancient versions present no variations; and

does not the deepest secret of Jesus' thought lie there? Does it not reveal that He meant something as different from the ordinary sense of "giving" as Paul's "pray without ceasing" shows that he meant something far different from all, now commonly associated with devotion? "All that thou hast." Jesus did not bid this pure-hearted young man to count off his tenth or his twentieth. He did not deal in tithing. That might do for Zaccheus, that might satisfy the conscience just awakened from sheer extortion and injustice, but it would not do for one who seemed to deserve the wide scope and the deep secret of the higher life. With such, it must be all, or else nothing that will satisfy the yearning of their nature: withholding aught, they make "the great refusal," and lose all.

Poverty in itself is not a beautiful thing. It is simply an easier possession than riches, just as a concertina is not a better instrument than an organ because it requires less skill to develop its capacities for harmony. The poor might well say to the rich, "We cannot help being poor—it is neither our merit nor our reward. It would be well if we poor people were better off. But if you, being rich, for our sakes become poor, that is the beautiful thing. We don't want you to give up anything to us—to pitch your money-bags into the street to demoralise us. We want you to possess for us, to be our manager and treasurer and secretary, and to be thankful for your duties, and to feel that unless you fulfil them you are simply as dishonest and as disgraceful as one of us, who, being paid beforehand for a day's work, drinks himself helpless and goes to sleep in a corner."

St. Giles breaks out and talks nonsense sometimes, part of it being nonsense that St. Grosvenor has helped to teach him. St. Grosvenor forgets to tell St. Giles that Jesus said it is the rich people who have the hard road into heaven. St. Grosvenor tells St. Giles that he is in a very bad way, and offers to pray for him. St. Grosvenor recommends St. Giles to emigrate, to retire to refuges and reformatories. St. Giles seldom takes the advice, but he assents quietly and respectfully. St. Grosvenor exhorts St. Giles' mission-workers to be instant in season and out of season, hopes they don't shrink from fever or night-nursing, trusts they are neat and attractive in look and manner, asks what they could earn by slop-work, in order to fix that sum as fit for their salary in God's service.

And then St. Giles gives his version of the lesson, which is that poor folk can't be too particular—he does not see that the rich are either, he adds in parenthesis, but that is no business of his). He wonders if the fine madam would like her boy shut up in a reformatory because he threw a stone at a bird. St. Giles has heard of gem'men shooting away at pigeons let out of a basket, and princesses and fine ladies looking on. If his boy could do that, then he'd have no call to throw stones at what isn't his'n. But right seems to be one thing to poor folks and another to rich ones. It ain't fair. And he's heard tell that for all her charity (which he doesn't see much of, anyway), that fine lady scarcely pays as much poor-rate as Mrs. Widow who keeps the chandler's shop and let him run a score when he was ill, and gave the kids many a bit and scrap. Justice first for him, mates. He thinks the man is in the right, who speaks out of the cart on Sunday mornings, and says all the money and land should be divided, share and share alike. And a curious look of the cap of liberty settles on his broken wide-awake, and one finds that defiance may ring through other tunes than the Marseillaise.

St. Giles visits St. Grosvenor sometimes on his own account. Lounging over the palings, he startles the fine ladies in the carriage ring. St. Giles is a shrewd fellow; he knows wickedness and impurity and levity when he sees them. He knows some of those people better than some of them know each other, and he says he does not see the mighty differ between himself and them—more shame to them, for there should be—St. Giles never having been taught "how hardly shall a rich man enter into the kingdom of heaven."

Everybody tells St. Giles his faults. Everybody takes the gloss off his virtues. He is well-provided with school-books. There are manuals of his duties—duties of "working men," and of "maids of all work." There are refuges where friendless girls may escape the coarser temptations of poverty, but they have abolished all the nunneries where forlorn girls of rank could find shelter from the miseries of aristocratic poverty or the black horrors of a loathed marriage.

What would St. Grosvenor think if St. Giles suddenly entered his drawing-room, cap-of-liberty wide-awake on head, and demanded how he laid out his income—what becomes of those annual hundreds not satisfactorily accounted for—what are the dates on his tradesmen's receipts — why his

daughter married a man forty years older than herself—how it was his sons all fell in love where there was plenty of money—and what his poor relations are subsisting upon? We fear St. Giles would speedily find himself in the hands of the policeman. Yet this is just what St. Grosvenor does to St. Giles. To be sure, St. Grosvenor pays a trifle for his privileges—gives as alms something which he ought to pay as duty, and wins the world's regard instead of the tax-gatherer's question and snub. Even apart from this, St. Grosvenor is often tolerated by St. Giles rather for what he expects than for what he gets.

Let us be very merciful to those whom we regard as our brothers chosen for more special consecration. For genius or beauty or wealth is always a beautiful thing as it comes from God, albeit, like the snow, it often falls on spots that defile it into ugliness. When we learn to see that what we think God's evil things are really good, and that all his bitterness is sweet, we must not mislearn that his good things are evil and his beautiful things undesirable. They are but the harder way, instead of the easier. When a man has fought through hardship and poverty till he has conquered poverty and pain, what has he right to expect from the children whom he has started from a very different point? He deserves that out of his strength they shall arise fit to fight as well in a far harder battle. They have to write out their life as straight and as clear as his, without his ruled lines of necessity. He had to work hard when hunger and need drove him to it, they have to work hard when pleasure and pastime woo them from it. He had to keep independent and gentle under temptations to truckle or to be bitter, they have to keep honest and chivalrous under temptations to be conventional or insolent. He must be tender with them. Instead of twitting them with their possession of "advantages" he did not enjoy himself, perhaps it would be juster and kinder and more to the point if he said, "You have to do more for yourself than I did. You have to learn some of the hardest lessons without a teacher. I was kept for twenty years at the costly school of Necessity. Beside that, your university is very cheap. People call me a self-made man; in all best lessons you must be self-taught men. I wish to do my best to help you, and that is why I limit your expenses and do not at once give all your tastes the gratification that is in my power. But in all these cases, you have only my weak will and wisdom to control you, where

I had God and all the august forces of the universe."

The wealthy youth starts on his travels, he journeys among people of his own class, where character is superficially concealed under one veneer of manner. He stays in sumptuous hotels; he goes to see palaces and pictures, with his tutor at his side, to remember the history of the one, and to explain the meaning of the other; he ascends mountains, he explores wildernesses; but everywhere there is somebody who will do anything for money. He forgets to write his letter home before he leaves the post-town, but for gold a trusty man will walk twenty miles with it. If he does not start in life with a stock of native wisdom, and if he is not almost as watchful for self-cultivation as Goethe himself, his wealth presently becomes but a poor substitute in his pocket for the observation, memory, and vigilance undeveloped in himself.

The poor boy goes out to seek his fortune. Nobody attempts to deceive him. He travels a thousand miles for a few shillings, making up the difference by the ready wit and strength God has given him. On his holidays, when he really cares to see something, he goes to the gallery or the cathedral, and having nobody to tell him what is admirable and ought to be admired, he finds out the picture which has really something to say to his soul. He sees behind the scenes of society. He hears how the man who despises others is in his turn despised. He knows how the philanthropist tried to dock a few pence from his little pittance. If he would get books or decent garments, he must be watchful of prices and places. He knows how the world progresses, because he stands at the end of everything.

It is curious how physical strength and vigour and mental ingenuity and power prove exact substitutes for more material possessions. The strong man does not need carriage and horses. The inventor plans a contrivance which serves him as well as a dozen servants, and the genius positively bequeaths an estate to his nation and the world—a palace not made with hands and fields decked with immortal green, whose farming, nevertheless, gives other men good bread and substantial beds. Think of the publishers and printers, the paper-makers and booksellers, the artists, critics, and lecturers to whom Shakespeare has given work! What would not a king have lost in solid golden gain to his exchequer, who, going out

to conquer a province, got such a man as that killed on the battle-field before he had done his work!

The ridiculous part is, that because the strong man sometimes has carriages and horses, he should therefore use them as if he was weak, while some really weak people have to drag themselves about as if they were strong! Why should a noble go on maintaining in menial idleness the men-servants who were once necessary for his own warlike purposes and for the defence of his wife and children? If he would emulate the old knight, his forefather, whom he merely imitates, he would lead out these his sturdy vassals to clear the pine forest and drain the marsh of new lands. If the old hunting instinct is strong in him, he should remember that he will find sport most, like his ancestors, not over fallow fields and frightened farm-yards, but among the wolves and bears which still hold settlers at bay in Labrador. If he has so much money that the careless world says it does not matter much if he does waste some in betting or in foreign gaming places, is he sure that every tenant on his land is getting quite fair value for the rent he pays, that nobody is keeping silence about the rotting thatch or the unsavoury smell, for fear speech would only bring down notice to quit? Is he quite sure that every labourer is getting full, just wages, for full, just work? And because the powerful must be always merciful, does he take care that schools and provident funds, and good rule and order, shall supplement the scantier wage which is still full and just, because the capacity and kind of labour which earns it is scant also? Does he remember that it is his own forefather's ignorance and blunder, if not violence and oppression, which has made Hodge's blood so thin and his joints so stiff, and that therefore all his supplemental aids are not alms, but strict justice—the payment of a debt charged on his estate when he inherited it?

If people recognised that every new guinea that comes to their purse has a duty attached to it, and a proper destination, we should be in no danger of the formation of those great wens of wealth which point to a diseased state of the social system, and may call for stern and strong remedies.

One man with a £1,000 a year, scrupulously pays his tenth; he is very exact; it is not a matter of open family purse with him, but of tax-gatherer precision. He gives God £100 a year, and it is laid out on home and foreign missions, local hospitals, refuges,

and the like. The other £900 he keeps to himself—very much to himself. He spends a great deal on his own dress, on luxuries which are not a bit of good to anybody but himself. He spends his leisure in getting these from a co-operative store, that as few people as possible may get a profit out of him, and by the saving thus made he is able to increase his stock of finery. He travels a great deal; he always goes first-class: well, that is money "put in circulation," as political economists say, but then it would be equally put in circulation if he paid for some friend to go with him, and they both travelled second-class. He gives a good deal of trouble to railway servants and porters; if all travellers gave as much, the staff would require doubling; but he gives no good-humoured little fees. "These people have their wages," he says. At home he receives a great many visitors; but that can be scarcely reckoned as an item of expense, because his guests are all those who "will bid him again, and so a recompence is made him." He has one servant who is just too old to expect full wages, and the others are too young and come from the workhouse, so that he tells them they should be thankful for such a chance of working up a good character. If there was nobody to be taken at a disadvantage in this battle of life, he would have to readjust his domestic plans.

His widowed sister's little boy is in a charity school. He does not subscribe to that, but to another precisely similar he gives £5 a-year. For a similar subscription to the hospital he sends his own servants there, and does not pay them any wages while they remain. His old nurse and governess, the friend of his boyhood, lives on a small pension from a benevolent fund, which he canvassed, and, as he proudly says, "got for her." But he goes to church, and feels that he is a generous man, and thanks God that he is not as his neighbour, whose income is the same as his own, but whose name is on no charity list, and who, when asked for a subscription, actually said he had no money to spare.

His despised neighbour deals at several small shops in his immediate neighbourhood: he knows he pays a little dearer than if he sent to the large town, but then he says the saving of time and energy is worth more than the trifle of money; and since certainly his saved time and energy are devoted to purposes of real friendship, with results of health and happiness, and even material prosperity which can never be wholly mea-

sured, even the sternest economist must admit that on hard utilitarian grounds he has reason on his side. He spends very little on luxuries for himself, though perhaps his "fancy" account is not much less than his neighbour's, because he sends little presents at Christmas and new year, and remembers people's birthdays. That cousin of his who finds it so hard to dress respectably, and yet save a little on her governess' salary, never misses her pretty box with the dozen of gloves on Christmas morning; and that other cousin, who has been twice jilted, feels that there is still some true friendship and remembrance left in the world, when he never forgets her birthday—no, not though it always falls in his autumn holiday, when he is travelling about with another cousin, who is a city clerk, and an old friend who lost his income for conscience' sake. They all travel third class, and he pays for them all, because, as he says, he couldn't travel alone, and he gets them to come with him where he likes, instead of leaving them free to choose for themselves—such tyranny really meaning that he carefully chooses the localities good for the lad's health, or likely to be useful for the old author's next book. When his servant was ill, he paid her railway fare to her home, and gave her wages in advance. He has a little orphan niece whom he keeps at a good school; and God only knows how it is that his scape-grace brother, who has been a heart-break to his whole life, who could not keep a shilling and would not earn one, nevertheless does not quite descend to the prison or the workhouse. As for the old tutor who was, as he says, "a father to him," he sits in his chimney-corner, and is "quite invaluable" to him, in the way of writing a few letters, and keeping up the discipline of the house when the master is called from home. He has many visitors, and gives the merriest parties—boys and girls from school, youths and maidens far from home, strangers from countries which he will never visit. He found a pound or two to spare when his window-cleaner's son wanted to go to Canada, and he wrote him a good letter of introduction which got him work immediately on his arrival; and he goes to church (except when he stays at home with some sick or sorrowful soul), and while he prays, "Lord, be merciful to me a sinner," his eyes fall on some poor old widow and he reflects that if he buys a zanella umbrella instead of a silk one, the difference in price will provide her with tea for two or three months.

And who shall say that he has not unravelled the secret, and has sold all he has, and distributed to the poor?

Is not Jesus' way the easier and the better? Nay, is it not this only, rooted far down in life, which makes the world endurable? Does not this discover the beautiful side of the truth which worldly-wise Solomon found so dismal when he said, "When goods increase, they are increased that eat them; and what good is there to the owners thereof, saving the beholding of them with their eyes?" What else does the owner want? Is a feast given that the host may eat all the dainties himself? Does he not rather forget to taste many, because he is enjoying the far greater sweetness of serving others? Ought he not to be thankful for what he has, mainly because it is so much to give away?

Only fancy Jesus' beautiful precept carried into large and loving obedience! It will be. That is coming. The great noble, some of whose ancestors probably thought "the common people" only made to insult and harry, now throws open his park and his palace for their enjoyment and instruction. It is not a very far look ahead to see the day when he shall think a hundred or two of his income justly and well applied in paying a cultured person (it would be an opening for the employment of ladies) to receive the visitors on his public days, and to understand the requirements of each party, and not rattle off the same stereotyped information to the accomplished archaeologist and to the Cockney holiday maker! Nor is it a wilder hope that some day he shall buy his pictures and store his library with as direct a view of appealing to the feelings and widening and stimulating the minds of his neighbours, to whom he owes his wealth, as of gratifying the tastes of his own family? Where will end the blessings of that day? For how much morally meretricious art and literature, whose taint and stain might have passed undiscovered among the perfumery and tinted glass of the château, will stand revealed when the generous hand opens the casements and lets the white light and the wild breeze of the moorland and the sea rush in upon them. And then the rich man will for himself claim some of those costly lessons which he misses now, and will know what it is to toil, and to be tired and spent because his own free-will says he "must" be so in the service of others.

Has not the world so advanced from old things as to embolden us to look forward far

more daringly than this? When we consider how incredulously our fathers would have scoffed at the ideas about capital and labour which are every day gaining ground, can we find no courage to look forward to a time when every waif shall have a home and every need a supply; when the rich and the poor shall meet like loving brothers, one of whom has dainties to divide, and is only sorry that there is one he cannot share—the delight of the dividing!

“Whether we eat or drink, or whatever we do, let us do it all for the glory of God,” which is the good of our fellow-men. Let us be rich for our brothers or poor for our brothers, knowing that all we have, our supply or our need, is theirs likewise, and that we have no more individual claim on the acres we plough and plant than we have

on the sunshine and the rain which descend upon them.

This is the message from God, which Jesus Christ and his disciples delivered to us nearly nineteen hundred years ago, and lo, it was so plain that men could not believe it, but made all sorts of queer caricatures of its severe beauty. All God's ways are simple and easy. He sets us no hard things, albeit our pride or prejudice may make his lessons the hardest of all.

Let us think of the gifted or wealthy with the tender sympathy we feel for those who have sublime tasks set them, and hard paths pointed out. And they shall answer meekly as the beautiful harmony of life grows beneath their touch, “With God all things are possible.”

ISABELLA FVIE MAYO.

FIRST FRUITS.

HALF covered with last year's leaves,
 She peeped from her russet bed;
 The great bare branches of the trees
 Were tossed and swayed overhead;
 The hedge looked barren and prickly,
 Without the sign of a leaf;
 Over the flower there bowed a heart
 Grown cold with the snows of grief.

The violet's fragile petals
 Enfolded a heart of gold,
 And a deeper wealth of perfume
 Than the tiny cup could hold;
 So the great wind roaring above
 Sent a tiny zephyr down,
 To drift aside the sheltering bloom,
 And bereave her of her crown.

It stole the familiar scent,
 To give to the burdened heart,
 With only a cold north wind
 In the world to take its part:
 The flower died in the bleak March air,
 And the heart went on its way;
 The violet's life was blooming there,
 And melting the snows away.

C. BROOKE.

THE STORM OF LIFE.

BY HESBA STRETTON, AUTHOR OF "JESSICA'S FIRST PRAYER," ETC.

CHAPTER XIII.—THE TRACKLESS DEEP.

SYLVANUS and Rosy watched and waited for Rachel's return, until the twilight in the narrow street became too dark for them to see the corner round which

she would come. The old man was not troubled or uneasy yet, and the child was too full of the morrow's pleasure to feel the shadow of a care. Mrs. Croft up-stairs was more open to the anticipation of any trouble, and as the daylight faded without bringing Rachel home, she grew anxious. She had consulted with her what provisions she should buy, and what shops she should go to; and even if she had been detained at every place, she ought to have returned before nightfall.

"Sylvanus," she said after a while to her husband, "I feel as if something had come amiss to Rachel."

"Nothing can come amiss to her," he answered, "for God is her refuge and strength, a very present help in trouble. But there's no trouble at hand, I hope. Maybe she's gone farther than she thought of to get what she wants."

"But the shops are all shut," said Mrs. Croft.

"There's no good in fretting," he replied cheerfully, "Rachel'll be in soon, for certain."

But before another hour had passed by, Sylvanus was becoming uneasy. Rachel did not care to be about the streets at any time, and to-night, when there were some preparations to be made for the trip to-morrow, her absence was perplexing.

XVII—16

"I'll go out and look for her," he said.

But when he had turned out of their own quiet street, where the houses had been mostly deserted all day, he found the broader thoroughfares thronged with holiday-makers, coming home after their day's pleasuring. He had never felt before how vast the number was of the people dwelling about him. "It's like searching for a needle in a bottle of hay," he thought, as he made his way slowly among the press, glancing anxiously into the faces of the women who met or passed him. From time to time he went back to the house in the hope that Rachel had reached home while he had been away, but each disappointment made him more uneasy, and when midnight came, it was no longer possible for him to put on a cheerful face, when he went into his wife's room. "Dearie," he said, "you and the little lass pray, while I search. I'm going to the hospitals now, and I'll ask the police. Never fear, we'll find her. Maybe it's only a little hurt after all, and we'll go to the sea some other time, if it's so that we can't go to-morrow."

To two or three of the nearest hospitals, where Rachel must have been carried if any accident had befallen her, the old man went in mingled hope and fear. There had been more cases received than ordinary at each place, and one or two of the women who had been hurt almost answered to his description, but upon referring to the books it was found that these patients had been able to give their names and addresses, and certainly could not be Rachel.

At the police offices it was the same thing; there were women locked up in the cells for being drunk and disorderly, but no one like Rachel. Sylvanus himself had scouted the idea that she could be among them, and had been ready to quarrel with the officer who had given him such an answer to his inquiry. But none of the men on duty had any knowledge of her. How should they, when hundreds of women like her had been strolling about the streets all day?

Foot-sore and heavy-hearted, Sylvanus turned homewards in the early morning sunshine. There was a mackerel sky overhead, with soft, fleecy clouds dappling the deep blue, and every now and then a little gust of wind from the south played past him. What a day it would have been to be setting off on

the great holiday of his life! Now it must be a day of suspense and astonishment; a day of anxiety and trouble. What could have happened to Rachel? He was lost in perplexity. A hundred questions hurried through his mind, but he could find no answer to them.

"The wings of the morning!" he said, looking up to the clear heaven above him, "the wings of the morning? Ah, Lord! I know; that's what the morning means to-day. 'If I ascend up to heaven, thou art there; if I make my bed in hell, behold thou art there. If I take the wings of the morning and dwell in the uttermost parts of the sea, even there shall thy hand lead me, and thy right hand shall hold me.' Yes, Lord. She's got fast hold of Thy hand, wherever she is. She couldn't be worse off than making her bed in hell, and behold, Thou art there! Lord, it's hard to believe. Help thou my unbelief."

The burden and the sorrow were still there, but the old man's heart grew strong to bear them. Rachel was not beyond God's presence, or his love. There might be grief for them all and a heavy cross to bear. But the cross would be borne in the sight of Him who had stooped to endure a heavier cross for them.

There was a lingering half-hope in his heart that he would find Rachel at home; but the sight of Rosy at the door, with red and swollen eyes and tangled hair, told him too plainly that she was still missing.

"Rosy," he said, drawing the girl in from the street, "the Lord has set us a lesson to learn, and He'll hear us say it Himself some day. It's a hard lesson, harder than any we've ever had maybe: but we must get it off by heart before He lets it come to an end."

CHAPTER XIV.—DRIFTING.

WHILE Sylvanus was walking home sadly after his fruitless search for her, Rachel had awakened from a wretched slumber to feel the misery of her circumstances. For a moment the hope of making her escape flashed across her; all were sleeping heavily in the foul atmosphere of the cellar, and it seemed easy for her to get away. But Trevor would not find it difficult to trace her. Rosy he did not know; he would not know her if she crossed his path a dozen times a day. But it would be easy to give such a description of herself to his many comrades as would make it impossible for her to continue to dwell in London, and render it full of risk to Rosy to try to live with her elsewhere. Rachel knew

too well how the class of criminals to which her husband belonged were linked and bound together.

Rachel hardly knew whether she was dozing or waking, but it seemed as if in the midst of the vile crew of sleeping reprobates about her, she had a kind of dream or vision of the Lord quitting, of his own will, the holy and happy heavens, to come down and dwell on earth. Even then He did not choose to dwell among the good and rich and high people; but called the worst of men to Him, the thieves and sinners and harlots. Oh! the pity and the patience of the Lord! If she could but have a little measure of the same pity and the same patience, she might win her husband back, as Jesus won the poor sinners to come to Him. She remembered what Sylvanus had once said to her, "You'd be satisfied if you won your husband to be good, ay! though you had to go down into the pit for him." She was going down into the pit; he was dragging her down. Perhaps she could not have done it of her own free will, as the Lord Jesus had done; but now she was down in the depths, she must try to bring back some soul with her when she was brought out of her sorrow. "Lord," she whispered, "only keep Rosy from coming here, and I'll do my best with him. If I'm tempted, ever so sore, to try and see my Rosy, oh! help me to keep away from her till he's a good man. Lord, thou knows it'll be very hard to do."

She could say no more, even in prayer; for her heart was full of grief when she thought of her child. She always carried in her pocket a little portrait of her taken three years ago; and now, as Trevor was sleeping soundly, she ventured to feel for it, that she might look at the beloved face in her trouble. But it was gone. Her pocket had been emptied; and Trevor had seen what a pretty creature Rosy was. It must make him more eager to find her; though, as Rachel recollected to her comfort, she was so much changed by this time, that only her eyes could trace the likeness, and the photograph would give him no help.

Trevor roused himself after a while in a surly mood. He had no wish to be hampered with his wife just then, and it would have suited him far better if she had stayed in her place for a time, subject to his irregular visits, and to his extortionate demands upon her wages. She was in fact a plague and nuisance to him; but he could not let her go until he knew where to find her when he wanted her. In the meantime the best way to conquer

her obstinacy was to make her life with him as great a burden as he dared to make it, with the dread of the police courts before him.

With this purpose, he dragged her with him to a neighbouring spirit vaults, where the sweet morning air was poisoned with the fumes of liquors. He tried to force a drain upon her, but Rachel was firm in her resistance. She knew too well that it would steal from her every good resolution, and every good thought, even if it gave her a short forgetfulness of her misery. Let her take this first step, and a swift descent into the degradation she dreaded would follow.

"Now then," said her husband as they went out again into the sunny street, and sauntered slowly and aimlessly along the pavement, "now, then, you've slept, and you've fasted on what you made up your mind to last night. You see what make of a home I can give you. Now, will you go back to your place, and be comfortable a while longer, till I can get a room somewhere for us; or are you bent upon thwarting and vexing me?"

"If you'll let me go without knowing where," she answered, with a sudden hope, which died away in an instant.

"A pretty fool I should be," he said sneeringly. "No, I go with you to the door, and see your master, and say, 'This woman's my wedded wife, and her child's my child,' or you never go out of my sight."

"Then I can't go," she answered, "I daren't go. Do what you choose with me; but I must take care of my Rosy. Oh, Trevor! only trust me this once; only let me go and say good-bye to them, and tell them how it is, and I'll never ask to go again. I'd come back to you faithful; I would, for certain."

But there was no advantage to himself in this proposal. He would still be encumbered with her, and would not know where Rosy was. That child would be of value to him; of such value that he could barely control his passion, and keep himself within bounds, as he looked at Rachel's resolute face, and thought that he could not wring her secret from her. Rachel herself could be of great use to him and his gang, if she could be brought to lend herself to their schemes. Her pretty face, and soft pleasant manner, and country voice, might beguile almost the most wary person into a trap. But there were these troublesome notions to be got rid of. He recollected how easily he had worked upon her in old times; how he could

wind her round his finger by a few flattering words and promises. Why! she was but the same woman still, and he must find out the way to manage her, either by severity or indulgence. If he would give way in one or two things, she would very soon give way in all.

"Well!" he said, "if you won't go, you won't, I know. I don't like to see you in a kennel like that yonder, so I must seek a lodging. You'd rather have a place to ourselves, I reckon."

"Any place," she cried eagerly, "any hole I can put my head into, rather than go amongst folks like them. Oh! only find me a place, and I'll work my fingers to the bone. I'll earn your living and mine. I'll do sewing, or go charring, or sell in the streets; anything in the world to keep us from starvation."

"Starvation!" he repeated, mockingly, "catch me starving whilst so many folks roll in money! Not I! But, come along; we'll look for a place to set up housekeeping. It'll be something like old days, won't it, Rachel?"

For a moment his thoughts wandered back to their wedding-day, eleven years ago, when Rachel was a girl of twenty. His heart, hard as it had grown, softened towards her. Why would she be such an obstinate simpleton as not to tell him where she had been living, and go home in comfort? It would be far better for her own sake.

"Look here, Rachel," he said, "I'll promise not to come nigh you for six months, if you'll let me come with you to your place. I'll give you another chance. I can't make you comfortable just yet, and you can have all that time in peace and quiet."

Six months! It seemed a long respite, during which she could live the tranquil, blessed life she had grown used to. But it would only be a respite, not a deliverance; and Rosy would be the payment for it. She shook her head silently.

"Come on, then," he said in a rough tone. He had not patience to carry out his own scheme of trying to break her will by flattery and kindness; and he marched on sullenly, taking care she did not fall behind him. As he had found her at the station, he felt sure she must live somewhere near it, and for this reason he took her back to the place, watching her closely to detect any sign of being near her home. But still, as the attic he hired was on the other side of the station, more than a mile of the maze of streets lay between it and Sylvanus Croft's house.

It was an attic in a close court, opening out of a poor street. There was no danger, Rachel thought, of Rosy ever passing by that way. The little window looked only upon a high blank wall, which rose high above it, shutting out all the sky. There was always a dim, gloomy light in the room, as if no ray of sunlight ever gladdened the blue heavens. Few sounds could reach it, except the cries and shrieks of children in the court below, or the shrill screams of women, and the deeper voices of men, shouting and swearing in their frequent brawls. Yet the dark, desolate, little room, bare and comfortless as it was, seemed like a haven of refuge to Rachel, after passing a night in the den of misery and vice her husband had taken her to.

"Trevor," she said, gently laying her hand on his arm, with a secret, wistful hope that he could not be so bad as she feared, "I'll be a good wife to you, if you'll only let me. Don't try to make me bad again. I can't ever get it out of my head now that God sees us, and is here with us. So I can't be bad again, like I was once. You try me, and see if I'm not a better woman than I used to be."

"Oh, bother!" he answered, shaking off her hand, "they've crammed your poor head full of folly, curse 'em! We might have had a jolly life, me, and you, and Rosy. I'm off now to tell my mates where to find me."

He locked the door when he went away, leaving her in the empty garret. Perhaps he expected her to shout after him, and rattle the door in a vain attempt to get out. But she was as quiet and submissive as when the prison-matron had locked her into the cell. She resolved to offer no resistance in things that concerned her outer life only; he should find her obedient and patient, let him do or say what he would. She sat down on the floor by the window and fell into thought, thinking of all she had lost so suddenly, without warning. She had no keepsake of her lost home with her, now Rosy's portrait was gone. Her Bible was in Rosy's school-bag. Even her treasured letter from the chaplain, worn and faded, and almost falling to pieces, was left behind her. But she had every word of it in her heart.

"You have made your life more stormy than God meant it to be," she murmured, half aloud. "But through all the storm of life, Christ will be beside you, and He will save you if you trust Him. Die rather than give way to sin. The storm will be over by-and-by, and you will come home to God, whither I am going now. One word more;

learn to say to yourself, wherever you may be, 'Thou, God, seest me! Thou, God, seest me!' I love you, Rachel. Christ loves you. God loves you. Be good."

CHAPTER XV.—A FRIENDLY BEACON.

DAY after day, as Rachel saw more of the wickedness and misery of the people among whom she dwelt, her resolve grew stronger to run no risk of dragging Rosy down into such a pit of infamy. She shuddered at the mere thought of it. That she as Trevor's wife must make his home her own she knew well; it never occurred to her that it was anything but her duty. But hot tears would fall from her eyes as her thoughts carried her on through the dreary, desolate years that stretched before her, if she could not win him from his evil ways. Still she felt her duty to Rosy to be as clear. She must buy her child's safety by the sacrifice of herself. Rosy would be lost if she tried to satisfy the hunger and the longing of her love for her little daughter. It would be as if the Lord had so longed to return to the peace and holiness of his Father's house, as to have gone home before his work was done, leaving us in our lost condition. He laid down his life for us. Rachel was called upon to lay down her life for Rosy.

She had plenty of work to do, for Trevor took care to keep her busy in the task of maintaining herself, and helping to keep him. It was better for her than enforced idleness would have been, when she could have done nothing but brood over the memory of the past. As soon as the light crept in in the morning, she was at her window stitching, and stitched hard all day, scarcely pausing to eat the scanty dinner which Trevor left for her when he went out. At first he had lounged about the court, in the fancy that as soon as Rachel thought he was clear out of the way, she would be off home, and he could follow her unseen. But she had deliberately counted the cost of her self-sacrifice. She had not overlooked this very trial. No; she would not try any chance that might imperil Rosy's safety and happiness. Even if she had to die, and send no word of love to her darling, she would keep the secret of her home safe from her husband.

Sometimes her thoughts would dwell upon how hard her absence and her silence would press upon Rosy and her friends, who loved her so truly. She knew how they would talk about her, how they would seek for her, and wonder that she could keep them in their sorrowful uncertainty. Or perhaps they

would mourn over her as dead. They might think that in some way or other she had perished in an accident, and there being no clue as to who she was, she had been buried in an unknown grave. How Sylvanus would grieve, and Rosy fret over her! Suppose, too, they should never, never hear of her again! If her husband was not won to honesty, and uprightness, and goodness, if he never repented of his crimes, so many and so terrible, if he continued reprobate and given up to all wickedness, she could never return to them, no, not for a brief glimpse of their peace and comfort. It was as if she was sunk in the gloom of a deep pit, and they far away in light and sunshine; and she could not even cry to them, lest they, leaning over the dark-some edge, should fall into the same black gulf.

Yet her love for Rosy burned more deeply, and more ardently than ever. The very sacrifice she was making for her gave it a mightier strength. As she sat alone in her garret stitching, she seemed able to recall every word her Rosy had ever spoken to her, and every look that had crossed her dear face. She could hear the tones of her voice, her laughter, her singing, her whispered prayers morning and evening. Sometimes it sounded so clear in her ears, that she called back again "Rosy," and started to wake up from her dream, and find where she was, in loneliness, almost in despair. But then there came another voice, low down in her heart which she had never heard with her ears, as she had done Rosy's, but which was growing clearer and clearer day by day; and that inward voice said to her, "Lo, I am with you. I will not leave you comfortless; I will come unto you."

One summer day after another passed by, and Rachel sat up in the gloom of the bare, comfortless attic, hardly earning pence enough to keep herself alive, without helping to maintain her husband. But he was not often short of money, however he might get it. Often when her sick appetite turned from the dry crusts which formed the chief part of her food, he would be feasting on some dainty in her sight, but not offering her a morsel. It was the system he was trying to conquer her obstinacy. She should see that her foolish ideas only deprived her of all that had once made life pleasant to her. He remembered her fond of finery, of gadding about from place to place, of nice delicacies to eat; and these were the things he would cut her off from till she came to her senses. She was used to the fresh air of the country, and to

freedom; she should be forced to stay in her garret breathing the foul and heavy atmosphere of the close slum. He would not be actively cruel to her. At times he spoke to her kindly, and her heart would beat with hope and pleasure. Surely by-and-by, good times would come. Trevor would love her yet, and be won from his bad ways, and they might make a new home for themselves in some distant country perhaps, where the sad story of their past lives was not known. But when these brief, bright gleams faded away, the darkness seemed blacker than before. She was a young woman still, and her life might be a long one. How could she keep true to Christ, if her husband continued as he was?

The strain was growing almost more than she could bear, when, one evening, as she was turning the corner of a street, not far from the court where she lived, she came suddenly upon Sylvanus himself. The chance of such a meeting had never crossed her mind, and now it was too sudden a shock for her. If he had not looked up into her white, thin face, he might have passed her, and been out of sight before she could have recovered strength to speak to him.

"Sylvie!" he cried, "why! Sylvie!"

He caught hold of both her hands, and held them in a firm grasp, as though he expected her to take fright, and run away from him. Oh! if she could but cling to his arm, and go home with him to Rosy! But that must not be.

"Hush!" she cried, "loose me. He'll see us maybe, and follow you. Look as if we were strangers, and you asking the way."

"Your husband?" he said.

Rachel nodded. Her voice seemed gone, and her throat was parched and dry. She did not know that Trevor was anywhere at hand, but her heart sank at the mere dread of it. Yet there was untold joy in seeing Sylvanus again, and in the chance of sending a message to Rosy.

"Can't anything be done?" asked Sylvanus, dropping her hands, but looking anxiously into her worn and sad face.

"Nothing," she said, "he wants to find Rosy, and make her bad like himself. He's as bad a man as ever; but, please God! he'll never find out where she is. I think at times my heart's broken; but I was a wicked girl when I married him, and now I must suffer for it. He says jail has made him as hard as a stone, and I'm afraid it's true."

She spoke rapidly and hoarsely, with a great effort to utter the words. But she knew

there was but a minute or two, and what they had to say must be said quickly.

"Where are you living?" asked Sylvanus.

"Oh! you mustn't know," she answered, "for fear you'd try to come to see me. Tell me how Rosy is. Give my love to her, and tell her she's not to fret after mother, but be as happy and good as she can. Don't let her know she's any father; not yet. Say I can't come to her for awhile, but I love her more than words can tell."

"But I can't let you go like this," said Sylvanus, "mother and me can't rest day or night for thinking of you. If I didn't know that the Lord had gathered you under his wing, and wouldn't lose you, I couldn't hold my head up, Rachel. 'I've lost her, but the Lord can't lose her.' I've said thousands of times to myself. 'She was lost once, but He found her; and surely she'll never stray away from Him again.'"

"I haven't," she answered, "but it's hard at times. There's nobody to care for me; and it all seems so dark, and there's no end to look forward to. It's as if Rosy was in heaven, and me in torment, and she can't come across to me, and I can't go to her. Only under all I know God is with me."

"That's it!" cried Sylvanus, "He's with us wherever we are. 'If we make our bed in hell, behold, He is there.' Oh! my poor Sylvie! my poor Rachel! bear on. 'Be thou faithful unto death, and He will give thee a crown of life.' Ay, I shall see a bright crown on your poor head. Wait a minute. You mustn't go from me yet."

"I daren't, I daren't," she said, "there must be no danger for Rosy. Go home some roundabout way, for fear. I'm better now; I can bear on, and there must be an end. Take care of my poor Rosy."

"Ay!" he answered, "but I can't lose sight of you again. Harken, Rachel; every Saturday night, at nine o'clock, I'll be at the corner of Seymour Street, and I'll stay till ten, and you try to go by. I'll not speak to you; but I'll be there, and maybe some day I'll bring Rosy with me."

He said it to induce Rachel to consent to his plan, and a bright glimpse of joy seemed to open before her. But there was risk in it, so great a risk that she steadily set her face against the joy to herself.

"No, no," she cried, "if Rosy was in sight I couldn't forbear, but run to her. Only you come, and maybe some time I may dare to speak to you. It'll help me to be faithful unto death; I know it will."

After this, on every Saturday night, what-

ever the weather might be, in storm or calm, in frost and rain, the old man stood for an hour at the corner of the street he had named. No one knew why he was there, so constantly and patiently, save his wife, who prayed for him at home, and Rachel, to whom his faithful love was the only light in her dark lot. He did not always see her pass by. Sometimes weeks would run out before she had the chance of walking that way without arousing her husband's suspicions. But Sylvanus never missed being at his post. When she could come, as she sauntered past him, not looking his way, unless she was sure there was no one near to see them, he whispered, "Rosy is well; we are all well." At times she dared to stop and speak to him for a minute or two. That was all the intercourse they could hold safely; but Rachel felt that without it she could not have lived.

CHAPTER XVI.—ALMOST WRECKED.

RACHEL grew more content now she was not utterly cut off from all news of her child. The hot summer days were gone, and the darker autumn evenings shortened her hours of work. Trevor left her more to herself, and took no notice when she stole out quietly to a little mission-hall in a street close by, where she could join tremulously in the singing of hymns, and hear the reading of the Bible. Her voice was weak and low, so different from the clear, sweet tones Sylvanus and Rosy had listened to in those happy times, that they would not have known it to be hers. The frequenters of the mission-hall spoke kindly to her, but Rachel did not dare to tell her story to any of them. Nobody could befriend her; her only help was in God. He alone could bring her up out of the horrible pit and out of the miry clay, and she must wait patiently for Him.

Before the winter fairly set in, there were some signs of amendment in her husband. He bought a few articles of furniture for their comfortless abode, and supplied her with money, which he solemnly assured her he had earned honestly. The lingering love and lingering hope, so loth to lose their hold of Rachel's heart, took a new life from this return of kindness. It seemed almost as though their early married days were coming back, when Trevor took a pride in her, and was most happy when he was near her. He would not let her slave over her stitching; and often of an evening he stayed at home with her, or asked her to walk out with him. He even went to the mission-hall, and stood in the porch, between the two doors, all the

time she was within. So hopeful she grew, that now and then he heard her laugh, almost merrily, as though the good times she had hardly dared to dream of were nigh at hand.

"Rachel," he said, one evening, as they sat together in the glimmering of a bright little fire, for he had told her not to light the candle—"Rachel, I'm sick and tired of my bad ways; I am, for certain."

"Oh, Trevor!" she cried, sobbing with gladness, "that 'ud be a happy day for me."

"Ay!" he continued, "I've been watching you, and trying you hard to see if your religion's real; and you always seem happier than us others; and you're a better woman than the rest of 'em, and a good wife to me, though I've been like a brute. There's something in it, I say; and I'm going to turn over a new life, and be a converted man."

"It's not easy," she said, "it's harder than you think. But God has forgiven me, and He'll forgive you; and help us both. Then you believe in Him at last!"

"Ay; I believe," he answered, "and I'm going to prove it too. I'll break off with all my old mates, I will; those that have led me wrong; and I'll stick to you, Rachel. We'll go down into the country somewhere, far away from 'em all; and we'll have a nice, pretty little cottage, with a bit of garden-ground, where there'll be a few roots of flowers for thee and Rosy, if she's with us; and by-and-by we'll have a cow to keep, and you can make butter, you know. There never was any butter like what you made at the Hall. Or, perhaps I could get a place as groom in some gentleman's stables, and you'd be dairy-maid. Ay! we'd go to church together of Sundays, me and you and Rosy; and maybe the parson'll come to see thee in thy cottage, and bring his wife and daughter with him, and they'd take notice of thee and Rosy, I know. And nobody'll ever know that both thee and me were once jail-birds."

Rachel's heart, which had been thrilling with gladness as her husband spoke, sank a little at these last words. It had all crossed her mind so vividly and really, the pretty cottage and its plot of garden, and the cow that she was to have charge of, that it smote upon her like a fresh unknown pain, to remember, that whatever joy or happiness came to her in this life, it could never alter the past. Thornbury jail was, and must always be, part of her sad story.

"Ay!" Trevor went on, "we're both tarred with the same brush, thee and me.

God Almighty has the same to forgive thee as me. Sometimes it seems as if you'd forgot what a great sinner you've been your self, Rachel; but you've been as bad as any of 'em in that sort o' way. Ay! you've sworn, and been drunk, and stole with the best of 'em. You were a clever lass, cleverer than the whole lot. But all that's over and gone. Only art thee sure as God Almighty's overlooked it? He's an awful Judge; harder than any judge down here. It 'ud be a hard thing to give up things here, and catch the same punishment after all. If He'd forgiven you, wouldn't He make things pleasanter? He keeps a grudge against thee, maybe; or you wouldn't have such troubles."

"He's forgiven me," said Rachel, thoughtfully, "like He forgave the poor thief who was hanged on the cross by Jesus. The thief wasn't unnailed from the cross, and set free to go home; but Jesus said, 'To-day thou shalt be with me in Paradise.' I suppose we must go on bearing our troubles here; but by-and-by we shall go and be with Jesus, and nobody'll cast our sins in our teeth then."

"Ay! but we can't go right away like he did," said Trevor, "we've got to live here, and have clothing and meat, for many a long year. So, Rachel, my dear, all I want is, for thee to help me get our pretty sunny cottage down in the country, where I can be a good husband, and a father to Rosy, and a Christian like thee. You'll help me your best, won't you, Rachel?"

"Yes," she answered, laying her hand on his, "I promise to help you my best; and I'll work day and night for it."

Trevor sat silent for some minutes, and the glimmer of the fire died out, leaving his face in darkness. But Rachel was not looking at him. Her memory had carried her back to the warm, comfortable cottage, where she had rested for a little while on her weary tramp from Thornbury jail to Aston workhouse. She could see the bright oaken dresser, and the shelves of shining crockery above it, and the red quarries of the floor, and the clear face of the clock in the corner. How she had wished she had such a house to take Rosy to! Was it possible that something like it would still belong to her?

"It's only doing a very little thing," said Trevor, very quietly, almost in a whisper, "God Almighty would overlook it again, like He's done the past. It isn't half as bad as you did before, and He's forgiven that. There isn't any danger to you this time, not a jot of it. And I swear to God I'll turn

over a new leaf as soon as I've got my share; I'll break with 'em all. I'll live on the square ever after if you'll only help me this once. Come, Rachel, you're such a simple, innocent-looking creature, and you can talk so clever, nobody 'ud suspect you, and you'd run no danger. 'They're folk so rich it wouldn't harm them to lose what we'd take; they'd never miss it, and it 'ud set us up for life."

Rachel listened breathlessly, all her hopes dying away, and a chilly despair creeping over her. The very brightness of the visions that had just filled her mind made her real life more intolerable to her. How could she go on, year after year perhaps, in this misery? How could she bear to have other children born, who must grow up amid these scenes of wickedness, with no chance of better things for them?

Trevor went on whispering his project to her. It seemed easy enough; at least her share did. And what was to be done? A fine lady would lose her jewels, and a rich man a small portion of his money. They would not lose a single comfort; no, not even a single luxury. Whilst her husband, and Rosy, and herself would gain everything that made life desirable.

Trevor was crafty and cunning, and for a little while he contrived to bewilder her simple mind. She had always been proud of his learning; and now as he talked to her persuasively and flatteringly, she wavered.

Yet she could not give in all at once. She would have Rosy again, and a home in the fresh, free air of the country, for which she was pining. It was only taking one wrong step to go right for ever afterwards. Would it not be better to go down this one step, and so rescue her husband from his evil ways?

But then she must do it in the sight of God. She could not hide herself from Him while she broke His commandment. Obedience was hard; but He looked for obedience in hard things as well as easy things. Could she ever dare to pray to Him again? He never overlooked anything, as Trevor had said. Could she think of Him watching her as she committed this crime? Could she ever sing with Rosy, in those days to come, if she felt herself again a thief?

It was a bitter conflict for her. Once or twice she lifted up her face to tell Trevor she was willing to help him; but she could not bring out the words. At last, with a heart-broken cry, she freed her hand from

his grasp, and fell upon her knees beside him.

"No, no," she said, "I daren't. I give it all up, Rosy, and you, and the cottage, and everything. I cannot disobey God. Not if you killed me, Trevor; no, not if I live here all my life, and never see Rosy again."

CHAPTER XVII.—A GLEAM OF SUNSHINE.

How it was Rachel could not tell, but a sense of great calmness and peace possessed her heart, after she had given up Rosy. It would have been a hard time for her but for that.

Trevor was more spiteful and malicious than before, and only stopped short, in his cunning mode of tormenting her, of that personal violence and cruelty which might drive her to appear against him before a magistrate.

In the close confinement of her gloomy attic her health had begun to give way. She was used to country ways, to light and air, and the foul atmosphere and dim twilight of the court were hurtful to her. But through it all, and in spite of it all, she felt a peace she had never tasted before. It was almost as if she already heard the Lord saying to her, "Well done, good and faithful servant!"

As the winter passed on she found it impossible to sit long enough at her stitching to earn sufficient food; and as her husband refused all help, she was compelled to seek her living by selling fruit and flowers in the streets. Sometimes she crept wearily along the hard and frosty pavements with a basket-load of Russian violets to sell; but few persons would linger in the strong east wind to buy a bunch of her flowers. Once she tried standing with oranges and apples at a busy corner, but the police bade her move on, and she found the burden too heavy to carry for any distance.

She wondered to find herself so weak; she, who had thought nothing of carrying baskets full of butter to Thornbury market. Now and then her pale wistful face caught the eye of some thoughtful passer by, who would stop to buy something from her out of pity.

But if it had not been for Sylvanus, she would not have earned enough to buy her own food, and to pay the rent of the attic, which Trevor left for her to do.

One evening, late in March, just as the sun was setting, and the streets were still

"THE STORM OF LIFE."

quite light, Rachel saw afar off, on the other side of the road, a girl like Rosy. She was coming swiftly along, with the light of the sun in her face, on the opposite pavement.

Rachel laid down her basket on a doorstep, and leaned against the wall, trembling with excitement. All day through she had been longing to see Rosy's face again, before she had another child to love and grieve over. But could this be her little daughter? this tall, upright girl, with her bright brown hair blowing

back from her rosy face, and her blue eyes smiling happily, as she hastened onward with light and rapid footsteps? Oh, she must never, never come into her place of misery!

It seemed to Rachel as if a great impassable gulf was fixed between them, and she could see Rosy safe and happy on the other side of it, but even if they would, they ought not to pass across to each other. Yes; it was Rosy. There was no room to doubt it. She had only to lift up her voice, and call aloud, and the child

Page 221.

would fly across to her. Oh! the rapture of holding her in her arms once more! Of kissing her pretty face! Oh, the pang of letting her go again! "Rosy! Rosy!" she cried; but it was in a whisper. She could not call aloud, and her eyes grew dim, as if the light was fading. When she came to herself again Rosy had passed by, and her swift, springing footsteps had carried her almost out of sight.

"It was best so, thought Rachel; better for Rosy to run no risk of being seen with her. For all she knew, Trevor, or

some of his vicious friends, might be at hand, and the child had escaped an unknown danger.

The agitation had left her tremulous and shaken, with barely strength enough to creep homewards. Yet it was as if she had seen some bright, blessed vision; almost as if an angel had passed by to give her comfort and courage. She knew that before her lay trouble and sorrow, perhaps greater than any she had yet suffered, but this fleeting glimpse of Rosy would never leave her mind. The child was not fretting or pining after her,

thank God! She was unfeignedly glad to have seen her looking so bright and happy. Sylvanus and Mrs. Croft made her a better father and mother than her own real parents were. Yes, though Mrs. Croft could not love her as she loved her, she would make a wiser and less faulty mother than she could ever be.

Rosy seemed to flit before her through the busy streets, now growing dusk with the falling night. Rachel was compelled to rest often on her way home, for she still felt fluttered and startled by her unlooked-for gladness. The curling brown hair, the bright eyes, the soft round cheeks, all seemed clear in her sight, as if they were just before her. She had seen her girl once more, and now she could be content.

Slowly she crept up the flights of dirty stairs which led to her attic, careful to make no noise, lest any of her neighbours should look out at their doors to speak to her, and so rudely disturb her new impressions of her child. She found the garret door locked, and when she tapped gently for her husband to open it, if he would, she could hear no sound on the other side. It was no uncommon thing, for, if he happened to be dozing, or if he felt angry with her, he often kept her standing outside, till it was his pleasure to let her in. All the night before he had been out, and very probably he had sunk into a heavy sleep, from which she dared not rouse him.

She sat down patiently on the topmost step of the staircase, and fell into a light slumber. For a little while all was forgotten, she felt no more her weariness and pain; her dread was gone. Rosy was with her again, a little helpless baby, with no power or strength of her own; too young yet to speak to her, too young even to know her. But oh! how she loved that tiny helpless creature! She thought she saw her growing, growing, quickly as things happen in dreams, and still her own love grew as quickly. Then, suddenly, a voice, strangely sweet and solemn, said to her, "Can a mother forget her child? Yea, she may forget; yet will not I forget thee." "That is God!" she cried, and, so crying, she awoke.

For a moment she could not but believe that she had heard His voice, as those three happy disciples heard it, when they were with Jesus on the Mount. But all was dark around her, and she was alone. Down below there was a distant sound of quarrelling and of children crying. She ventured once more to tap softly at the attic door, but still

there was no answer. Looking more closely, she saw that the key was not in the lock. Her husband, therefore, could not be inside.

She was about to sit down again to wait his return, when a woman who lived in the room below called her to come down for a minute, for she had a message from Trevor for her. Her face wore a look of importance, as she set a chair for Rachel.

"Now, don't you take on," she said, "we're all your friends here, for you're a good, decent creature, Rachel Trevor; and I wish we were more like you, I do. There, now! Trevor's been took up, and he sent word by Julia to say you must get along as well as you can, till he's home again. Julia says he's bound to have ten years, or more, this time; for they were as bold as bull-dogs, and so headlong and venturesome as if there wasn't police or anythink. Bur, lor! who knows? he might be back again in a week or two, if they can't prove anythink against him. Jue was off like a shot as soon as she'd left the message. 'We'll do our best for her, poor soul!' said I, 'whether he comes back or not.' So, there's the key; and I'll bring you a cup of tea by-and-by."

"Thank you kindly," answered Rachel, taking the key, and going back absently into her poor garret. It did not seem real, this sudden change. Rosy passing by, and her husband gone! Gone; in jail again. There would be no one now who would care to watch her, and dog her steps. She was free once more to go where she pleased. Possibly Trevor would be parted from her by another long term of years, and these ten months would seem only a dream of misery. Should she send her neighbour to let Sylvanus know, and to bring him to her? But even yet she shuddered at the idea of Rosy being known as Trevor's child. She dared not let anybody possess a clue to her. It would be dangerous to let one of Trevor's comrades even see his little daughter. No; Rosy, on the safe, bright side of the gulf, must never pass it to come to her,

But could she go to Rosy? Could she even now go home? Was it too late? She saw Rosy stretching out her arms to her, and heard her calling across the gulf. Yes; she would go home, if it were only to die on the door-step, which Rosy's feet so often trod.

CHAPTER XVIII.—THE DESIRED HAVEN.

WITH a strange smile upon her worn pale face, Rachel descended for the last time those steps she had trodden so many months, bowed down in spirit, and broken in heart.

The way home was long and indirect ; the streets appeared to lie about her like the meshes of a great net which had caught her in its web. She did not know the nearest road, for she had never dared to walk towards home ; yet it was important that she should hasten, for midnight was not far off, and her strength might not hold out to the end. The day's work had exhausted it, and the few grains left were ebbing fast away. Snow and sleet were driving on the easterly wind, which moaned and whistled past her along the narrow streets. Scarcely a footfall was heard, for the hour was late and the cold severe. But Rachel heeded neither the piercing wind nor her own feebleness. She was going home, where there would be shelter from the pitiless storm ; but it was of Rosy she was thinking, not of the shelter. Yet now and then she broke out into an almost unconscious wail : " I shall never reach it ! I shall never see her ! " The houses stretched before her in longer and longer rows, whilst her steps grew slower. It was a great way off. Whenever she paused to inquire from any chance passer-by how far it was, the answer made it seem impossible that she could ever reach home. If it had not been home she was trying to reach, she must have given in, and fallen down in the streets to die.

It was the dead of the night when she turned the corner of the street where Rosy lived. For the last half-hour she had not heard a sound in any of the houses she had passed. The snow-flakes that had fallen thickly upon her did not melt. Numb and drooping she dragged her weary feet along the silent pavement. How familiar every house was to her, and yet how strange and forbidding, with every door barred against her, and every window darkened ! She could only creep from door to door. Would she have strength left to arouse those who were fast locked in sleep at home ? Or would she be obliged to sink down and die on the very threshold ?

The street lamp lit up the front of the house, with its numerous sign-boards, and a dim light was burning, as it always burned, behind the white curtains of Mrs. Croft's chamber. How well she knew the pleasant room within ! Mrs. Croft might be lying awake, as she often did, listening to the cruel blast of the storm, and praying for the poor creatures exposed to its fury. If she were waking, she would surely catch the sound of the feeblest knock or the faintest cry. But if she should be asleep !

Rachel lifted her shaking hand, and gave a faint, low rap at the door, such as a little child might give. It was scarcely loud enough to be heard, and there was no echo of it along the empty passage within. She tried to raise her voice and call, but there was no sound in her voice. She sank down on the doorstep moaning. No answer came to her ; all was still as death in the house. Yet Rosy was there, fast asleep in her warm bed. Rosy, who would break her heart to-morrow, if she awoke in the morning, and found her dead on the very threshold. She could not bear to think of Rosy's great grief.

" God sees me," she murmured, " God sees me. He will help me."

She raised herself up and cried again—a long, mournful cry. Then she knew she had made the last effort possible to her. A strange languor and drowsiness seemed creeping over her ; a pleasant sense of rest, as if the worst was over, and all would soon be well with her. Far away, as it seemed, she heard a footstep coming nearer and nearer to her, and a gleam shone through the fan-light over the door. Her ear was growing deaf, but the well-known sound of a key turning in its lock reached her drowsy brain. " It's not the jail," she thought, " it's home." Looking up through her dim eyes, she saw, as through a mist, the wrinkled, withered face of Sylvanus bending down over her.

" Why, it's Sylvie," he cried, " come home again at last ! "

But Rachel heard no more. There was no need to take care of herself, or rouse herself, any longer. She was safe now, and might give way to the unconsciousness that was fast gaining upon her.

CHAPTER XIX.—THE STORM ENDED.

LATE the next day Rachel's second child was born. There was no hope from the first that she should recover her strength ; it had ebbed too low, even if she had not had her long and toilsome wandering through the storm. She must have died, said the doctor, if she had remained in her desolate attic, with no one about her except the hard and vicious women, who would have been her only companions. Now she lay at rest in her own quiet chamber at home ; a faint yet very happy smile never left her face. All was so peaceful and so safe ; there was no fear of her husband ever finding Rosy, and it would even add to her security if she died herself.

" Nobody knows what might happen if I lived," she whispered, " all his mates know me, and some of them might see me some

day ; but nobody knows Rosy. You'll always take care of her ; she'll belong to nobody save you now, master."

"Call me father, Rachel," said Sylvanus, the tears rolling fast down his furrowed cheeks ; "it's as if Sylvie was dying again. As long as God leaves you with me, call me father."

"Father !" she repeated, with a brighter smile, "why ! I begin to think as God Himself'll let me call Him Father after I'm dead. I've been so wicked I never dared to say 'Our Father' to Him yet. But it'll be quite a new life there, and it'll all be different. I'm glad God knows what I've been here, so as I shan't have to tell Him, and He won't cast it against me, will He?"

"No, no," said Sylvanus ; "He says, 'Your sins will I remember no more.' You'll be as free from 'em as your little new-born babe."

"I'm not sorry I'm going," she went on in her low undertones ; "though I must leave Rosy behind me. It's better for her, and she's a big girl now, and can do without a mother—such a mother as I've been ! There's only one thing I'd ask God, if He said I might have what I choose. I'd like to take my baby with me ; it wouldn't seem so strange there where I'm going if I'd my little baby to take care of just at first, you know. I was never so happy as when Rosy was born. Look at it, father ; it's a poor, weak, ailing little thing. It 'ud be a great trouble and charge to you."

"No," answered Sylvanus, "it 'ud be no trouble, neither to me, nor mother, nor Rosy. But there ! Rosy shall come and lie down quiet beside you, and maybe you'll fall asleep, and wake up brighter and stronger."

Softly and gently Rosy lay down beside her mother. The light was too low for Rachel to see her bonny face plainly ; but she felt her child's arm thrown lightly across her, and her soft, warm cheek laid against her own. How full of content the mother's heart was at last !

"Rosy," she whispered, "mother's been a wicked woman. It was true what they said of me at Aston ; but I've repented of my sins, and the Lord has taken them away. I don't know how He has taken them, it's all a secret to me ; but they don't feel heavy on me now ; and when I think I am going to see his face, I'm glad, Rosy. He isn't my Judge, that I'm afraid of ; He's my Saviour. And I'm not going to any sort of prison ; I'm going home for good. When you think that mother was once a wicked woman, you say to yourself, 'Jesus loved her in spite of

all, and He forgave her, and now she's gone to be with Him in paradise."

"Yes, mother," sobbed Rosy.

"My Rosy 'll never grow up wicked," she went on, "she must die rather than fall into sin. It's not hard to die, if this is dying ; but oh ! it's very hard to be wicked, it's a cruel, dreadful thing. There are folks worse than wild beasts, Rosy ; even girls like you, that never know what it is to be good. I couldn't go to God happy if I thought you'd ever be like them. Don't cry, my dearie. I'm not crying, though I'm going to leave you behind me."

"Oh, mother ! get well again," cried Rosy, "don't leave me."

"It's best for you, Rosy," she murmured, "if I'd planned it all, it couldn't have been better. You'll be quite, quite safe now, all your life long. Nobody saw me come here, and nobody 'll ever see me in the streets again. If I'd planned it ever so, it couldn't have been safer for you."

"Rachel," said Sylvanus anxiously, "keep quiet now, and try to go to sleep a bit."

"Maybe I shall never wake again," she answered, pressing Rosy's arm with her weak fingers ; "tell my mistress I send my love and duty to her, and I give up Rosy to you both gladly, gladly. There ! I can go to sleep now."

She fell asleep presently with her hand on Rosy's arm, though she had not strength enough to clasp it. Her white face was turned towards the hearth where the nurse sat with the baby on her lap ; and now and then the wailing of the child reached her dull ears, causing her to stir a little, uneasily. But by-and-by the piteous moan ceased, and no other sound broke into the silent room, as hour after hour passed by of the night. Rosy fell asleep at Rachel's side ; but even in her sleep she kept her arm about her mother's neck, as if to keep her still in this world. The nurse, too, nodded and slumbered on the hearth, and Sylvanus alone watched and prayed earnestly beside the dying woman. It was Sylvie dying over again ; yet bitter as it was to him to lose her, he knew that it would be better for her to die. There was no resting-place for her on earth where she could be free from the chain of her past sins. The dark thread she had woven into the web of her life must run all through it. But the old man whispered to himself, "These are they which came out of great tribulation, and have washed their robes and made them white in the blood of the Lamb." Yes, it was far best that Rachel should die.

At length the grey dawn came, and the wind which had been wailing all night fell. Through the uncurtained window the snow could be seen covering all the roofs with a pure and glittering white. Presently the light smote upon Rachel's closed eyelids, and she opened them for a moment, but shut them again, dazzled with the brightness.

"Where am I?" she asked in a low, awestricken voice.

"Here, Rachel," answered Sylvanus, "with Rosy and me yet."

"The storm is quite over," she said softly, "and there is a bright, bright light. It'll never be dark any more; never be rough any more. God is very good to me."

"Rachel," said Sylvanus, "God has given you what you asked for."

He slipped his hand tenderly beneath her head, and raised it an inch or two from the pillow. Under the window through which the morning sun was shining, lay her baby silent and still, with a thin white covering only thrown over its tiny frame. A light, brighter than a smile, dawned in Rachel's dim eyes, and shone there, when her head sank again on the pillow.

"It won't seem so strange now," she whispered. "God knew I should want something, even among the angels. I needn't trouble about a name for her now; God will give her a name."

Her happy eyes closed again, and her breath came softly and regularly through her parted lips; so softly and regularly that Sylvanus thought she had fallen asleep, and would not stir for fear of disturbing her. Once she tried to turn her head, and her lips moved as if she were whispering the name of Rosy. Her rest was tranquil and peaceful. The smile upon her face grew more solemn, but not less glad. As the rays of the early sun fell full upon her, her eyelids quivered a little, though they did not unclose; but she spoke as one waking from a dream.

"Father!" she cried, in a tone of amazement and of great joy. Sylvanus laid his hand tenderly upon hers, which was growing chilly, for she was passing across the threshold of a new home where he could not follow her yet; but she could not feel the touch of his hand, or hear Rosy's cry. The storm of life was ended for her, and already she was in the haven where she would be.

CHAPTER XX.—THOU GOD SEEST ME.

THEY buried Rachel in a corner of a crowded cemetery. Sylvanus fancied he

would like to take her to some quiet country churchyard, where the birds would sing over her grave; but he was obliged to give up his wish. As it was, he and Rosy could go often to keep the flowers bright above it; and by-and-by, as months passed away, it became a quiet pleasure to tend the little mound, and to talk together of the home whither she was gone.

"Mother," said Sylvanus, a few weeks after Rachel's death, "I'm thinking I'd like to know what became of our poor girl's husband. She told me where she'd been living with him, and I'll take roundabout ways and be precautions, for Rosy's sake; but I do want to know what's become of him."

"Sylvanus," cried his wife in alarm, "you'll never think of trying to win him back?"

"I'll see," he answered; "but I'm afraid he's past my winning, if Rachel couldn't do it."

Sylvanus took so many roundabout ways to seek the court where Trevor had lived that he had fairly lost himself before he found it. It lay in the heart of a thick rookery of poor streets, and even he who had himself been a poor man, and had seen many a bad court in London, was appalled by the sights he witnessed there. It was not that the inhabitants of it were so poor, as that they were so degraded and lost to all sense of good. Scarcely a word reached his ears that was not an evil one. Men and women bore the stamp of wickedness on their faces, and the children themselves seemed already marked for sin. He passed through them in his working clothes, exciting little notice; but his heart was wrung with compassion and pity for his poor Rachel, who had dwelt among them.

"It's like hell!" he said to himself; "it's like hell upon earth! And she lived here, trying to win him back, and believing God saw her. Eh! it's enough to make anybody believe as He doesn't see, or He'd burn us up like Sodom and Gomorrah! Only that was before the dear Lord died. There's never been a judgment like that, since He was crucified."

He did not ask after Rachel, as he had thought of doing, for the very sight of the place had extinguished the faint hope he had of seeking after her husband, and trying to win him to God. If he could be so vile and hardened as to make his home there, and to compel his wife to dwell among such people, there was no chance that his heart

could be touched and softened by the story of her death. No; he must run no risk whatever of bringing Rosy down to a pit of wickedness like this.

But before he left the court, he saw a woman somewhat less shameful-looking than the rest, who was sitting on the door-step of one of the houses. He stopped for a minute beside her, and she said "Good morning" to him in a civil tone.

"Could you tell me anything of a man of the name of Trevor?" he asked her.

"Trevor! Ay!" she said. "He's been in trouble, but nothing could be proved against him; and they were forced to let him get off scot free. Only the police were hard on him; and he went away for awhile. Are you a friend of his, master?"

"No," he answered, "I never saw him. Had he any family?"

"He'd a wife," she said, "a decent, tidy woman as ever trod. He said she'd been in jail once; but she was country-born and country-bred, and she didn't take to the ways of the folks here. She went away the very day Trevor was took up, and she's never been heard of since. Some of the gang 'ud like to find her, for he was set on

not letting her go; what for, I don't know. I was sorry for her, I was."

"Did you speak kind to her?" he asked, the tears standing in his eyes.

"Master," she answered earnestly, "I used to hear her singing hymns sometimes, up yonder at her window, when he was out of the way, and I used to wish I was her. If you lived here, you'd have thought her an angel, you would. Ay! I spoke kind to her, when I did speak, for I was ashamed for her to see me. I went up to her door once, and she was talking like to herself, or to somebody I couldn't see. I looked through the keyhole, and there she was stitching away for very life; it wasn't saying prayers, for she hadn't time to kneel down; she was talking, only there was nobody to talk to. I hearkened through the door at what she said, and they were words that run often in my head at times."

"What words were they?" asked Sylvanus.

"I hardly like to take them in my mouth," said the woman; "there she sat stitch, stitching; and she was saying half to herself, and half to somebody I couldn't see, 'Christ loves me; God loves me! Thou, God, seest me!'"

THE END.

"THE WORLD BY WISDOM KNEW NOT GOD."

1 Cor. i. 21.

THY love of nature's laws, and searchings deep,
We blame not, nor would have thee less revere

The knowledge such can give, nor do we fear

The seeming discords, as your fingers sweep

The echoing keys of that long past, where sleep

Those chords, yet unrevealed to mortal ear,

Which yet shall make creation's purpose clear,

And tune to joy the voice of those who weep.

If nature charm thee, then, like her, obey

Those laws which are not hers, but ever flow

From Wisdom, which to carnal sight is dim,

Whose spirit, scorned by thee, shall make thee lay

Thy hard-earned wisdom at the feet of Him,

Whom then alone thou shalt begin to know.

E.

SOUTH AFRICA.

IV.

IT was into such a waste as that described at the end of last article that the great "trek" of the Boers led in the years from 1834 to 1840. Then began a change among the wild animals as great as among the wild men. For years, however, few English hunters penetrated into the wilds. Captain Harris, an English officer, was the first. His graphic account of sport, and his sketches of the wild animals met with, forms, perhaps, still the best work among the many now existing on African wild life, as among the animals the one which he discovered and named "Harrisbok" is the most beautiful.

Then at long intervals followed Oswald, Cumming, Anderson, Shelley, and a host of others; of all these men Oswald's name lives longest in the native mind. "He would put three bullets in the pocket of his waistcoat," they say, "and riding close to an elephant, shoot him in three shots. He did not stand firing at him from afar."

Yet, long before hunter had entered the wilds, missionaries had gone into Damara and the desert. The veteran Moffat, Edwards, and Campbell formed stations far into the interior before a Boer had "treked" over the Gareip.

In 1812 Campbell visited the city of Latakoo, and the chief Maraka, or Moroko, of the Morolongs. Moroko is still alive; sixty-three years have passed away, yet Moroko is chief of his tribe. He is probably the oldest man in South Africa.

This tribe of Barrolongs, as they are called to-day, deserves some notice at our hands. More than forty years ago, Campbell induced the chief and his tribe to move from the Vaal river to the hill we have already spoken of, which, standing in the midst of a vast plain, is called the Hill of Night.

Around this lofty hill, in the many valleys which lie at its base, the Barrolongs made their homes. Beyond them, to the east, lay the Basuto country, and from Thabanchu to the rock kraal of Moshesh at Thaba Bossiou, was not more than fifty miles.

Moroko paid an annual tribute to Moshesh, and acknowledged the Basuto as his paramount; but when difficulties arose between the white men and the Basutos, Moroko sided with the white man.

His territory, consisting of nine hundred square miles of fertile land, was given by him (we presume) in trust to the Wesleyan

Society, of which body Mr. Campbell was a missionary.

At the end of the struggle between the Dutch and the Basutos, this Barrolong possession was an isolated native reserve, surrounded on all sides by the Orange Free State. What is to-day called in the Free State "the conquered territory," lay around it upon three sides. Moroko, however, remained on his location; around on every side Dutch farms sprang up, and with the usual forgetfulness of the fact that the Barrolongs were in possession of their ground at Thabanchu long before a Boer had planted a beacon nigh the Caledon, many a hungry eye is now turned to this country of Morokos, and men speculate upon the probable expulsion of the Barrolongs into some distant wilds when the old chief shall have passed away. This land hunger seems a disease, which grows the more it feeds. Men in South Africa are not content with the already vast tracts in their possession; one hears constantly in the Free State of a man having two, four, or six farms each of six thousand acres, some of which he has never even looked upon, and yet the cry is more, more, more; and year after year pretexts are found for bringing to sale the scant remnants of native possessions in the remote "Hoeks" of the Vetteberg or the Rhodeberg, where yet lingers some scattered race of Zulu or Basuto.

And now, having dwelt a long time in these mountain and upland countries of South Africa, let us descend, ere leaving altogether the land, and dwell, if only for a little while, in the region heretofore hardly looked upon in these pages—the meadow we have called Natal.

The people of Natal call the great range of the Drakensberg their garden wall. Hitherto we have looked upon the garden from the top of this wall, and if now we descend from that summit and gather fruits and flowers, with a few weeds too, in the garden beneath, it will be as fitting a "last look" at South Africa as we can give that glorious region in these pages.

Men, white men, first found Natal on a Christmas day. The Cape of Storms had been passed—the terrible sea whose waves rage in what seems an eternity of tempest, around that lone promontory where Afric's

knew every touch of my heel and every turn of my wrist, for I had hunted game with him for two years on the upper plains. I called him 'Zwart,' and he knew his name as well as a dog. I had my long gun with me, a bag of bullets, and a flask of powder.

"Well, I did not stop long on the hilltop to think; my laager was yet clear of Kaffirs, and in five minutes I was inside it.

"But, meantime, it was going hard with our people in the farthest laager; the shots from the waggons were getting fewer, the shouts of the stormers getting louder. Old Jacob Van der Sell was in command of our laager; the old man was watching the fight, and talking to himself as he watched 'Oosthousen.' He said suddenly to me, 'You have got a good horse under you. Boy, there's a bag of bullets and a keg of powder in this waggon; they want lead and powder in the laager yonder; strap the bag and the keg behind your saddle and carry them to the laager. You'll save the lives of all of them there, if you can get in.'

"I did as he told me, got the keg and the bag well fastened to the saddle, said 'good bye' to a few of the people standing near, and rode out from the waggons.

"There were only a few scattered bands of Kaffirs near our laager, for our turn had yet to come, and nearly the whole army was at work at the laager to which I was going. I took Zwart at an easy canter across the valley, and it was a minute or so before the Kaffirs noticed me; but they thought little of one horseman, and kept charging up towards the waggons, and falling back again from the shots.

"I rode up to within one hundred yards of the hindmost rank of them, and fired into the crowd. Many of them yelled and turned at me; but I could just play with them as I liked, and I kept Zwart in a hand canter back and forwards, up and down, firing and falling back to load again.

"I fired thus twenty or more shots into them, and rode right round the outside edge of them, before they seemed to know what I was doing. Sometimes they would charge me detached parties, and I had to keep my eyes well round me to watch that they did not get too close from behind while I was engaged with others in front, for at fifty yards the long-handled assagai goes swift and sure from a Zulu's hand. But they never touched me; round and round, in and out, I went, firing and reloading, while the Zulus yelled like demons, stopping every now and again when my long 'roeer' gun

sent its bullets among them, and some brave rolled over shot through his ox-hide shield.

"Zwart seemed to relish the work as much as I did, and more perhaps; for all the time it seemed only sport to him, while I was thinking of the work that lay before me of getting through the dense mass of Zulus into the hard-pressed laager.

"The Zulus themselves seemed to know what I wanted; and when they found that they could not catch me in the open, it occurred to them that if they opened out a lane for me through their ranks, they might succeed better in entangling me amongst them; so they fell back for a space on both sides, leaving a passage free towards the laager.

"When I saw this open lane leading in to the waggons, I knew it was the sole chance I had of getting in to my comrades; but I kept wheeling Zwart about, as if not too much in earnest of trying it. At last I put a big, big charge into the 'roeer,' turned the horse's head full for the opening, and drove both spurs into his flanks. He had been well within his pace all the time, and now he had lots of it left for the last moment. He flew like an arrow up the lane of savages; never after wildebeaste or quagga or ostrich did he go like that day. Once we were in the thick of the Zulus, they were afraid to fling, so close were the opposite ranks. As I neared the laager, a crowd of savages rushed out yelling, with shields and stabbing assagais. I levelled the 'roeer' full on them, and drove the horse after the pellets, through shields and smoke and savages; and then, with a couple of assagais in Zwart's flank, and one through my leg, I was inside the laager—keg and bag of bullets safe.

"We fought them for an hour afterwards, and beat them off in the end; but they stormed two of the laagers, and killed all our people in them. Ah! that was a night, if you like—such a night! Women had lost their children, husbands their wives, men their brothers; every one was in sorrow. The Zulus spared nothing. All through the night the wail of women was to be heard, and when morning came we gathered the remnants together into one laager, buried our slaughtered people, and sat down to plan revenge.

"Six hundred of our kith and kin fell that day. Well may all that region bear the name of 'Weenan,' the 'place of weeping.' She was a child [pointing to his wife] in that laager."

Thus the old man told his story while his wife (who had appeared at an early stage of the narrative with a plate full of golden oranges) sat listening to the one great event of her life, now told, I dare say, for the one thousandth time in her hearing.

When I rose to depart, the old couple came out, stuffing the oranges into pocket and holster; and as I said "Good-bye" to the simple old Dutch farmer, I thought how many men carry "the cross of valour" for half that gallant morning's work by the laager on the Bushman's river. What Goldsmith wrote of

"The rude Carinthian boor,
Who 'gainst the homeless stranger shuts his door,"

cannot be applied to the South African Dutchman. If rude, he has ever been hospitable, and the stranger had always a welcome at his gate; but latterly he has become changed in this respect, and with good reason.

The rich treasures of gold and diamonds found in the far sheep pastures of Boerdom have caused many a European scoundrel to migrate thither, and in the simple and unlettered Africander the educated villaindom of Europe and America has found a rich field for exploits.

As one travels now through upland South Africa, one can glean a hundred stories of how some unfortunate boer fell victim to cunning and duplicity; how men came and purchased his sheep from him, and then paid him in ten-shilling Cape notes. He, simple soul, seeing only a large figure 10 on the face of the paper, never dreaming that the number referred to shillings, took but a shilling in the pound for his herds, and only discovered his mistake months later, when he journeyed to the nearest market town, sixty miles distant, to cash his imagined treasure.

Of the outside world, the Dutch Boer knew nothing. Suddenly the outside world came to him to cheat and to lie, and it is natural that he should shrink from it in alarm.

Not long ago there came a Boer from up-country to Pietermaritzburg, the chief town of Natal. He had £3,000 in notes and gold in his waggon. People told him there was a bank in the town in which care would be taken of his money. He took his long-hoarded wealth to the bank and stated his case. The official counted the money and said, "There is £3,000 here; we will take it and give you every year £4 for each £100. For the whole you will get £120 a-year."

"What is that you say?" answered the Boer. "Give me £120 for looking after my money and taking care of it! Oh no—you must be a great robber to say such a thing. Give me back my money; you are a great rascal! Had you asked me to pay you for taking care of my money, I would have trusted you; but now give me it back again." And he took his gold to the waggon.

We were once a passenger in an up-country post-car. A Boer had stopped the car a few days before, and asked the driver to bring him, on the next trip, a small bottle of English porter. The driver did as he was asked, and now the bottle was forthcoming. "What is the use of one small bottle?" asked the driver. "Oh, it is for my wife," answered the Boer. "The doctor has ordered my wife porter, and I am going to give it to her in teaspoonsful."

When diamonds were first discovered at Kimberly, the farm on which they were found was in the possession of a certain De Beer. As may be presumed from his name, "Old De Beer," as he was called, was a Boer among Boers. He sold his farm for £6,000, and moved away to the north. It chanced that in time men looking for diamonds came to "prospect" his new farm. He went angrily to them. "Now look, my friends," he said, "I don't want any of this diamond-finding on my farm; I have had that sort of thing before. If you find diamonds about here, I'll only have to move away again. I don't like people coming around, and I don't like them diamonds that make people come around; so you just stop your digging, and go along somewhere else."

The Boer is a fearless and practised rider, and an unerring shot. Life in the "Veldt" is familiar to him in all its aspects. He can rough it with any man, tame or wild, the world over, nevertheless he is not a soldier; he will fight Zulu or Bechuana or Basuto, but then he will have the long flint "roeer" against the arrow or the assagai, or the Westley Richards breech-loading rifle against a rusty musket. He is ever ready to take the field: his rifle and gun are in the room-corner, his ammunition-pouch is ever full, his horse (knee-haltered or in the stable) he can turn out at short notice. Nevertheless he is not a soldier, and he never will be one.

In one of the many boundary disputes arising out of the diamond discovery, a party of Boers and Englishmen met in opposition near a place called Hebron, on the

Vaal River. As is frequently the custom in such cases, the anxiety for battle diminished with the distance between the opposing forces, and a parley was proposed by the respective leaders when the hosts came within shooting proximity.

There happened to be in the ranks of the English party a native of Ireland, who naturally did not at all relish the pacific turn affairs seemed to be assuming. While the leaders debated the settlement of the dispute, Pat left the ranks of his party, and approaching the place of consultation, demanded of his chief (now busily engaged with the Boer commandant in smoking and debate) if he and his friends on the hill might be permitted to open fire upon their opponents before any further discussion on the cause of quarrel was proceeded with?

The Boer, alarmed at this sudden proposition to defer diplomacy to war, asked the meaning of such a bloodthirsty request.

"The boys want the word to fire," replied Pat, "because they are so mortal hungry."

Not altogether perceiving the force of the reasoning, but deeming it wise to remove such an evident *casus belli*, the Boer commander at once sent forward a sheep and an ox to appease both the food hunger and thirst for blood of the opposite side; and as the map of South Africa presents Hebron on the Vaal River without those two crossed swords indicative of a field of fight, it may be presumed that matters ended with no greater sacrifice of life than that of the animals which Pat led back in triumph to his hungry comrades.

Many are the stories told against the Boer to-day in South Africa; they are all, or nearly all, of the same kind. Modern civilisation in its first contact has burned the Boer, and we need not be surprised if he now sometimes dreads the fire.

Fifty years ago such stories were current in New York and the quaint villages along the Hudson; the tide of immigration has long since swept away these old memories, and the bellow of the steamboat and the whistle of the railway engine have broken "the long sleep of twenty years," and scared from the Catskill the ghosts of the old Dutch mynheers; but they have not all passed wholly away.

While yet they lingered around the old familiar haunts, a master hand caught the outlines, and to-day we have in England a picture so full of poetry, so perfect in its union between simple joy and sorrow, pathos and humour, that "Sleepy Hollow" and its

dead Dutch denizens will live in the world's recollection when many a huge mushroom city of the western continent will be forgotten.

Meanwhile we have wandered far from Natal, and space warns us we must make ready to take leave ere long of scene and subject.

We have said before, in speaking of Natal, that its history is a recent one. In an old book of travels, published more than a century ago, there occurs a passing notice of the "terra Natalis." "Ships went," says this old chronicle, "from India to Natal for ivory. More than two years were occupied in the voyage; the country abounded in wild animals of every kind;" and there was in this land of Natal, in the year 1718, "a Penitent Pirate"—(delicious alliteration!)"—"who sequestered himself from his Abominable Community, and retired out of Harm's way." This is the first notice which we possess of white colonisation in South-east Africa.

The Penitent Pirate had probably as good a time of it in old Natal as any retired buccaneer ever enjoyed. Plenty of game, a delicious climate, at that time peaceable people, and no police! What a premium such a superannuation would have proved to piracy, had it been generally known! The world has grown too small for these things now, and soon there will not exist in the wide circle of the globe a spot where one can, in the language of the old chronicle, bid farewell to pleasure, piracy, or politics, and gracefully "retire out of harm's way."

"What is the climate like in Natal? What can you grow there?" will ask the reader who has followed us through these pages, intent perhaps on the practical aspect of the subject, and caring little for early history or future outlooks.

Well, first as to climate—When the sun in December is with us low down in the southern horizon at mid-day, he is nearly in zenith power over the great plains of South Africa. Man's shadow falls short on the hot ground, and oftentimes a dry and fevered wind sweeps along the red and sultry earth. But in Natal the rain all falls during this season of summer, and the reason is simple enough. The burning plains of Griqualand, and the Kalliharri Desert and of the wild region lying west of the Trans-Vaal Republic, cause the heated air to ascend. To supply the vacuum there is a rush of air from the Indian Ocean heavily charged with moisture; this air, driven rapidly up the steep surface

incline of Natal is soon four thousand feet above the level of the sea; precipitation quickly follows; fierce thunderstorms shake the hills, and at times torrents of rain descend upon the land; but all this changes as the sun begins to travel into the northern hemisphere; the thunder ceases, the clouds clear away, the sky is blue and bright, the nights grow colder and colder, a delicious freshness fills the morning, at night the stars gleam in many-coloured brilliancy, and the sun at morn and even looks his first and last upon the earth in colours which would make the long *dying* Judson actually expire in an agony of unimitative rage.

South Africa knows two different seasons at the same time. During the dry cold season in Natal, it is the wet cold season at the Cape and along the southern coast; but Natal possesses one feature in its climate peculiar to itself. It is everything in a few miles. It is sub-tropic at the coast; snow crowns the Drakensberg during seven months of the year; perpetual vegetation reigns along the Indian Sea; fifty miles inland hoar frost has yellowed the grass ere the last month of summer has come. In the limits of a single day's ride one passes from the coffee and the sugar cane, to the oak and the pine tree. If one wants a lazy sensuous climate, the ridge of the Berea Hill over the Bay of Durban yields it to perfection. The atmosphere is heavy with the scent of tropic jessamine; the breeze is soft with the odour of the Indian Ocean; eye and ear are rested by lulling sound and contrast of shore and sea.

Over the tree tops, where cluster the many-hued trailers rich with flowers, the white line of the surf sends ceaseless music to the forest hill; far out the sea and sky, which so long have been conducting themselves with "perfect propriety," mutual mirrors at a distance, approach each other when nearly out of sight of land, and join hands together in a soft and dreamy haze like two lovers who think themselves unseen; but suddenly the early sunrise steals upon their union, and along the forehead of the sky, and over the bosom of the deep there flushes a great crimson blush to find their love-making revealed to the prying shore.

But how shall we describe the freshness of the atmosphere, the keen exhilaration of every sense, in the great plateau country, one hundred and fifty miles from the sea?—ah, that is difficult! It is easy enough to sketch the soft and sunny clime, the air laden with almond flowers or jessamine, the glitter of southern moonlight, the murmur of warm tide

against tropic strand; but the great prairie or plateau o'er which the wind comes, the sole world's wanderer freshened by every league he has travelled bearing to you the vast freshness of space, fanning you with the breath of the mountain peak, breathing upon you a spirit distilled from dew and starlight, and all the endless freshness which dwells six thousand feet above our lower world—how can all this be put into word shape? Yet ere we wander into such a subject there still remain a few practical matters to be spoken of, and these we will first turn to.

We have already said that the climate of Natal presented strange varieties—a corresponding antithesis of soil exists throughout the country, rich and poor, good and bad, fruitful and arid, are to be found twenty times repeated in the compass of a day's journey. The soil is what Western Americans call "spotted;" along some sloping hill, or narrow valley, the "tambookie" grass will grow level with a horseman's head; close by the pasture will be short and crisp, and rocks will stud the surface.

In the western States of America, a farmer says, "Settle only where the Indian corn ripens, for there nearly every other plant will be found." If the saying be a good one, then Natal is a land eminently suited for settlement; for the "mealie" ripens as well there as in any part of the globe. It forms, in fact, the staple food of the large Kafir population numbering more than three hundred thousand souls.

If one wishes to see grouped in a small space, every tree, shrub, and bush, flower, fruit, and vegetable, which nature usually scatters far apart over the world, there is a spot in the neighbourhood of Pietermaritzburg where that wish can be realised. It is a nook set round with hills. Eight years ago it was as wild a waste as all the ridge and valley land around it. To-day it would tire one to enumerate the varieties of tree and shrub, and fruit and flower, covering these sixty acres.

The Wellingtonia, and the Douglass, the Deodora, the Insignus, and the Norfolk Island pine already lift their graceful heads thirty or forty feet above the ground. Tea, coffee, orange, lemon, guava, grow thick and rank; pine-apples, mangoes, grenadilloes, flourish side by side. Strawberries are ripe all the year round; the northern fruits are there in profusion, and the rose the whole year through in a perpetuity of bloom.

This oasis in the wilderness is the result of only eight years labour. An English judge,

well known on the South African bench, has taught South African farmers what their land can do. In other countries men see only in their old age, the tree planted in their youth attain to size and growth; but here in Natal in less than a decade of years the pines of America and the gums of Australia are forest trees in bulk and height. The natural indigenous trees of South Africa take centuries to mature. High up in the "kloof," bordering the sides of mountain streams, and covering some steep hill face, the "yellow wood" the box, the Protea, and the countless other evergreens grow almost imperceptibly year by year. The timber is very valuable, for it is hard almost as the giant boulders which cumber the ground whereon these forest patches grow, and old as the hills to which they cling.

In the foregoing pages we have tried to put before the reader a general idea of South Africa, past and present. The space at our disposal has been limited, the subject has been extensive, and it has often been no easy matter to condense into the form of connected narrative, the widely scattered elements we have had to deal with. But to the reader who has followed us, three epochs or groups of events will be apparent, and these we will now briefly recapitulate.

The first epoch has been marked by a spirit of organization and aggression manifesting itself on the part of the natives of Zululand, a spirit which in turn acted upon all the tribes of Southern Africa, forcing the different races of Zulus, Basutos, and Kaffirs into contact with each other, and afterwards into contact and conflict with the white man.

The second epoch saw the great "trek" of the Dutch Boers from the limits of the old colony into the northern wilderness, and the consequent development of the interior region of South Africa. Indeed, this event has been pregnant with greater results than any other event in the whole history of the country. It is still bearing fruits. Even to-day there are veteran Boers steadily holding their northern way eleven hundred miles from the Cape of Storms deeper into the wilds. The old dream of Araby has not been abandoned, and a New Jerusalem has arisen on the shores of lake N'Gami, founded by the quaint and dauntless Kruger.

Before this steady stream of white men the fighting Kaffir has fallen back. Fifty years ago the dreaded Matebilli dwelt upon the Vaal. Twenty-five years ago their outposts were on the Crocodile; now their kraals are built on the southern tributaries of the great Zambezi.

Thus the tides of race flow back upon the heart of Africa. Will the Fever Zone stay the progress of the white man? We think not. The Fever Zone did not stop the white man in America, neither will it in South Africa; for, independently of the natural impulse to extend, there is in the case of South Africa an inducement to the white race to spread itself to the north, which is the most potent of modern times, we mean the inducement of great mineral wealth; and this brings us to our last event or epoch, the discovery of precious metals and stones in the countries north of the Orange River.

This last event, or rather series of events, has recast the political destiny of the Southern continent, and has given to the English race the future possession of that vast region.

Wherever gold has been found in this nineteenth century of ours there the English tongue has taken root, there the English idea has triumphed; but though English, not necessarily England. Republicanism grows apace in soils turned by the gold miner, and it is possible that Dutch South Africa, in accepting the inevitable language of the miner in gold or diamonds, will still keep intact the form of its political life.

It is a curious paradox, but still a true one, that modern aristocratic England is too democratic for many of her colonies. The equality of all men in the eyes of the law finds poor favour in the sight of an English colonist in countries where black and white men are thrown together.

To too many of our race the sentiment of equality has reference only to a set of beings above them in the social scale; apply it equally to all, let it affect a dark race, or another people, and the sentiment instantly changes to one of repressive superiority.

Thus to-day, though the English tongue becomes yearly more and more the language of the Dutch States of South Africa, the bond of connection with England does not grow stronger.

To a student of history it sometimes appears strange that thirteen distinct colonies of Dutch and English America banded so readily against the mother country just a hundred years ago; but to any one who watches the germs of political thought in the various South African States at the present time, the question ceases to perplex.

As to the future of South Africa, that is assured. This southern hemisphere is yet only a new world. It is not anywhere four hundred years old. Much of it has not been known to the world more than seventy years.

In dry land it is not a sixth of the northern hemisphere. In wealth of precious metals it yields to-day four-fifths of the world's gold. Its coal, iron, and copper, of which there are vast deposits, are almost untouched, men pass such things lightly by while gold, diamonds, and silver are to be found; yet the time for these things will come too.

Set midway between the great continents of South America and Australia, South Africa, even had it been destitute of mineral wealth, must eventually become important from its geographical position. The empires called into existence fifty years ago in South America have hitherto signally failed to fulfil the destiny Canning foretold for them at their birth; but their future is certain of success. These immense valleys of the Amazon and the La Plata, these fertile plains of South Cordova and the Rio Negro, must yet yield to overcrowded Europe the same outlet for surplus population which the Mississippi and St. Lawrence, and the prairie land of Illinois, have already given. Then the wealth now deep-bedded in these unknown mountains, where the Apurimac and the Upper Madeira have their origin, will be poured forth to the world, and from that wondrous system of inland water will spring a commerce which shall call to its aid the coal products now lying uncared-for in the central continent of the southern hemisphere—Africa.

This continent of South Africa labours under many drawbacks. Its rivers are utterly useless to commerce; its railroad system is in its crude commencement; its harbours are, with few exceptions, dangerous and shallow; its distances are great; its populations scattered; its highways and roads are bad. But it has soil fruitful to labour, splendid climate, varied productions, scenery, a hardy healthy race, great mineral wealth, precious metals, and unlimited space. This last item is not often fully understood. The condition of space is even more essential to a new country than to an old one.

South Africa is capable of almost indefinite expansion. Like the term North or South America, it means in reality a continent. Too long we have sought to restrict the meaning of that term to the Cape Colony, Kaffraria, Natal, and the Orange Free State. Large as the aggregate of these states is, it is only small compared with the possible future of the South African empire.

Twenty years ago English statesmen sought to stay the dominion of England in South Africa, at the Orange River. Events have been too strong for their efforts, and

already the tide has flowed far away over the Orange River into lands which a score of years hence will be looked upon as lying far within the limits of civilisation. The natural pathway to the dim interior lies not through the feverish swamp of Zanzibar, not through Congo or Angola, but along the lofty plateau which spreads far north from the regions we have been describing until it merges into the half-fabled Mountains of the Moon. This range of the Drakensberg is prolonged throughout the entire length of Eastern Africa. Its summits guard Tanganika and divide the Nyanzas; and, from some other Mont Aux Sources far to the north of this culminating ridge of the Drakensberg in Basuto-land, springs, in all human probability, the parent rill of the long-sought Nile.

Even as we write, news has come which should cause men in England who have at heart the old honour of the land, to feel prouder of their race and time.

A white man has crossed the vast dim continent from shore to shore. It is a noble story, and one which will ring clearer down the pathway of the future, for time prolongs the echoes of such deeds in louder tones than those in which contemporary history first utters them.

The veteran explorer had sunk at last, a worn-out skeleton in the midst of a vast unending marsh; but as he sank, the banner which he so long had borne was seized by the young sailor, and through the great wilderness, by lake and swamp, across the dim interior continent unknown to white men, he bore it, until at last, three thousand miles from the start-point, he heard the hollow roar of the Atlantic billows beating on the sands of Benguela.

When the story of South Africa is fully told, when the white wave rolls no longer to the north, it may be found that these wilds, which first heard the faint echoes of civilisation in "the tread of the Cameron clan," lie wholly within the limits of a dominion whose southern extreme is marked by the Cape of Storms. To-day all is dim in that vast interior. Far back, the immense continent sleeps in sullen savagery; but as this lofty Drakensberg first catches the ray of morning on its summits, when over the Indian Ocean the sun rises from his sea-bed, so in the far future, along these lofty highlands, the dawn of life will touch hilltop after hilltop until it lights at last those central summits which overlook the mystery of the Nile.

W. F. BUTLER.

TWILIGHT VOICES.

WHAT are the whispering voices
That awake at twilight fall?
Do they come from the golden sunset
With their haunting, haunting call?

They tell me of breezy spring-times,
And of dreamy summer eves,
And of snow-wreaths merrily shaken
From the shining ivy leaves.

But the far-off treble changeth
To a tenor tone, and so
I know that the voices tell me
Only of long ago.

What are the tuneful voices
That of early dawn are born?
Do they come from the orient portals
Of the Palace of the Morn?

They tell of a Golden City,
With pearl and jasper bright,
And of shining forms that beckon
Out of the dazzling light.

Then a rush of far-off harpings
Blends with the vision clear,
And I know that the night is passing,
And I know that the day is near!

F. H.

SCIENTIFIC CRUELTY.

NATHANIEL HAWTHORNE at one place says that the idle are always cruel. This may be true, but there can be no doubt that the busy can be cruel also, as he himself aptly demonstrated in his story of the Poisoned Flowers. Men absorbed in one aim, with eye directed towards a definite goal, often inflict great suffering, not from any delight in it, but from sheer abstraction from the rights and demands of other creatures. In days like ours, and amidst an artificial society, with conflicting interests ever increasing, the cruelties of the idle are likely to be more effectively dealt with than the cruelties of the busy and absorbed. Cock-fighting has been made an end of; bull-baiting has been put down; the ægis of the law has been thrown over the poor dogs, which used to be attached to miniature carriages and waggons, and driven, panting, till they dropt; a drunken costermonger is no more at liberty to maul his own donkey as he pleases. A keen sympathy with animals—first stirred deeply by the poetry of Cowper, Burns, and Wordsworth—has been kept alive by various influences, and the legislature has repeatedly endorsed and confirmed it. Few men nowadays would openly avow that they had been parties to torturing a dumb creature. But a new illustration has just been given to the public of how the busy may be cruel, and on their plain confession gradually grow indifferent to pain, even while seeking for the best means to assuage it.

He would be less than trustworthy who would fail to acknowledge the vast debt society owes to the medical profession, not less to those who labour to add to its scientific armoury, than to those who are instant in ordinary practice. But a glance at the recent report of the Royal Commission on Vivisection does a little tend to discompose the impartial layman. First of all, we find the most eminent physiologists of the kingdom, men who are familiar with the abstrusest secrets of the human frame, disagreeing *in toto* about the amount of pain inflicted on certain animals by certain experiments. Dr. Pavy does not think that a healthy frog suffers much from the experience of being put into boiling water; but Dr. Sibson holds that Goltz's experiment of boiling a frog to death is a horrible idea; and Dr. Swayne Taylor has no doubt that putting a frog into water at 100° Fah., like putting a warm-blooded creature into 212° is a cruel ex-

periment, and he cannot see what purpose it would answer. Dr. Sibson did not think that any suffering worth speaking of would be involved in raising the temperature of animals till they died, that is, baking them; but Dr. Sharpey said, "that the baking of animals and the freezing them to death are very severe experiments, worth making once, but ought not to be repeated;" a point on which Dr. Burdon Sanderson was at one with him. Opinion was certainly various enough even about the warm-blooded animals. Dr. Rutherford remarked that it was "wonderful what you could do to a sheep-dog without the animal making any commotion;" but Dr. Klein acknowledged that he had verified the old saw which made "cats uncanny," and for fear of being scratched, and no other reason, he indulged them with a little chloroform before vivisectioning. We are not sure whether in the light of Dr. Rutherford's remarks about the "wise passiveness" of the dog-tribe, we do not reach a new illustration of design, when we find Dr. Swayne Taylor saying that "a dog experiences the effects of poison (of all animals) most like a human being; the doses of poison for a middle-aged dog being similar to those which will act on a human being, while the symptoms of suffering are very much the same." But Dr. Swayne Taylor humanely adds, "There is something very dreadful in the operation of strychnine upon a dog—it no doubt suffers agonizing pain." Dr. Rutherford asserts that little or no pain is caused to dogs paralyzed by curari, while foreign substances are being injected into them to stimulate secretion of bile; but Dr. Hoggan firmly asserts that "the pain inflicted would be much more intense than a gall-stone passing along the bile-duct of the human subject."

The battle of divergent opinion, however, raged most wildly round the frog. Dr. Lister did "not believe that the sufferings of the frog were worthy of serious consideration;" Dr. Simon again had no doubt as to the frog's full sensibility to pain. Dr. Pritchard had "performed thousands of operations on animals, and had never yet been able to detect any difference in sensation between the skin of either one or the other and the human subject save this, that the cuticle was thicker in some animals than in others, and of course, the knife had to penetrate deeper to reach the sensitive structure; but this once reached, he thought it as sensitive in the one animal as in the other." Perhaps

Dr. Pritchard believes in the identity of protoplasm and all its possibilities; but it is odd that, though he has reached these convictions, he confesses that, whilst he would never think of applying chloroform to dogs at all, he agrees with Dr. Klein in the decisive confession—"Would use it on a cat." (!)

Though it needs to be acknowledged that, during the few years Dr. Klein has been working in English laboratories, he has been singularly successful, and has done great service to medical science, yet it is surely cause for deep regret either that he should have spoken with such decision, or that he could not honestly do else. He was so much inclined to modify materially what he had said in correcting the proofs that the only course left open to the Commissioners was to print his evidence from the short-hand notes, and his corrected version of it side by side. There we find him answering two most important questions, thus:—

"When you say that you only use them (anæsthetics) for convenience sake, do you mean that you have no regard at all for the sufferings of the animals?—No regard at all.

"You are prepared to establish that as a principle which you approve?—I think that with regard to an experimenter, a man who conducts special research, and performs an experiment, he has no time, so to speak, for thinking what the animal will feel or suffer. His only purpose is to perform the experiment, to learn as much from it as possible, and to do it as quickly as possible."

As for "frogs and the lower animals," the question of their pain was not worth a moment's consideration; and he thus told in his own words about that little selective point in his method and the reasons for it:—

"Why do you not chloroform a dog?—I chloroform a cat because I am afraid of being scratched.

"Why not a dog?—If it is a small dog, there is no fear of being bitten by the dog."

After this, we confess we hardly know what to make of Dr. Klein's caustic remark, interjected in correcting his evidence, on the superiority of public opinion abroad to that in England. "It assumes," he writes, "that men of science, like men in general, have *conscience* enough not needlessly to hurt brute animals."

Now, these very different views of the susceptibility of animals to pain, and the very different treatment of them, suggests at any rate that wise uniformity of procedure among physiologists is not so prevalent as it might be. The matter is complicated by the fact amply attested in evidence that many are now experimenting from mere curiosity,

or for the sake of abstract knowledge. Mr. G. H. Lewes, with an accent of deep regret, said, "One man discovers a fact, or publishes an experiment, and instantly all over Europe certain people set to work to repeat it. They will repeat it, and repeat it, and repeat it." Sir William Fergusson said, "The impression on my mind is, that these experiments are done frequently in a most reckless manner and (if known to the public) would bring the reputation of certain scientific men far below what it should be. I have reason to imagine that sufferings incidental to such operations are protracted in a very shocking manner." And then he proceeded to speak of the deadening and demoralising effect on the students, adding strength to what he said by quoting the opinion of Syme, who "lived to express an abhorrence of such operations, at all events if they were not useful." Dr. Haughton, of Dublin, says he would shrink with horror from accustoming large classes of young men to the sight of animals under vivisection. He believed that many of them would become cruel and hardened, and would go away and repeat these experiments recklessly. Science would gain nothing, and the world would have let loose upon it *a set of young devils!* Professor Rolleston stated that Haller—a very famous physiologist—"in his old age fell into a permanent anguish of conscience, reproaching himself for his vivisections," and similar cases of others were cited.

Evidence clearly showed that in various large university towns hundreds of dogs and cats were procured, not always fairly, and operated upon by the students in their own rooms. The alleged sufferings of the poor animals, left often for whole nights to pine and die in dark closets, were indescribable. Students are not likely to escape the hardening process thus indicated by Dr. Walker as taking place in a professor.

"An observation which first brought to my notice the hardening effect of habit, both moral and physical, was this. I used to dine very often with a lecturer in physiology, and one night I found that I could not enjoy either my cigar or my dinner, because the day before we had gone through the laboratory, and I could not get rid of the imploring looks of the dogs which hoped for some food every time that they saw a human being, the patient suffering of the fowls, and of the desperate efforts made by some rabbits to allay the pangs of hunger with anything to engage the digestion; and it appeared to me that my friend was indifferent. He had been a vivisector some years: I was a beginner."

We have always felt that the much-talked-of advantage to be gained from freedom in such matters was problematic. Even al-

though all the knowledge that can possibly be realised by such experiments were in our hands to-day, is it quite an ascertained fact that it would be a gain to the world if it were at the cost of the hardening of the moral nature in most of those who took part in them or witnessed them—in those, too, the bulk of whom are hereafter to be “healers?” Anyway, we think the Commission made out a good case for some form of licence, which shall make the useless repetitions of painful experiments illegal and impossible, and ensure a more uniform use of anaesthetics, which, with many operators, are at present confessedly used merely to suit their own convenience. This would not interfere with or limit useful research; and it is something

that Sir J. Watson, Drs. Burdon Sanderson, Ferrier and Gamgee agree in this. We hope Parliament may before long have the question under its consideration. The separate recommendation of Mr. Hutton, to exempt dogs and cats wholly from vivisection, because of their more sensitive organization, developed by long contact with man, and because of the trust and confidence they have come to repose in him, we believe most of our readers would be inclined to support. And we doubt not that many who have had to do with horses would put in a plea for their exemption also. It seems so cruel to make the end of so willing a slave of man a series of prolonged tortures.

E. CONDER GRAY.

THE NATURAL HISTORY OF ATHEISM.

III.

IT is not only uncontradicted lordship that tends to run into godlessness; unlimited liberty also has its freaks. There is an Atheism of democracy, no less than of despotism. Every extreme of self-assertion, or, as the Brahmins would express it, the attempt to make an independent *I*, whether by violently over-riding every other body, or by asserting an absolute independence for each individual, is a rebellion against the firm concatenation of closely subordinated items of which the social framework is composed. From extreme democracy, as from a hotbed, Atheism in its rankest stage naturally shoots up. And accordingly, whether it be in the subtle disputations of ancient glib-tongued Athens, or on the fiery rim of modern French revolutionary craters, or on the more innocent platform of London East-End Sabbath-evening orations, this hideous monstrosity parades itself with observation. How, indeed, should it be otherwise? There is nothing in the idea of mere liberty to create the feeling of reverence; the desire of unlimited liberty is an essentially selfish feeling, and has no regard for any Power from above, that might impose silence on each windy self-proclaimer. The fundamental maxim of all pure democracy is simply this—“I am as good as you, and perhaps a little better; I acknowledge nobody as my master, whether in heaven above or on earth beneath; I will not be fettered.” This natural connection between democracy and irreverence it was that caused Plato to make the observation, that even the dogs in Athens had a certain look of impertinence about them which was not observed in

Sparta.* And Aristophanes, that large-viewed spectator of the strange and troubled times in which he lived, in his wise burlesque, called *The Clouds*, introduces a democratic and sophist-trained young Hopeful, cunningly arguing himself free from all the restraints of filial duty, and making disobedience to parents one of the household liberties which unfettered democracy was to assert. Quite consistently too. The insubordinate and rebellious instinct which denies God in heaven, and the king upon the throne, cannot long tolerate the restraints imposed by the natural authority of the father, and the rules of domestic discipline. There is, indeed, no cry more false, more delusive, more contrary to the eternal nature of things, than that which modern democracy has chosen for its favourite watchword—Liberty. No doubt the word has a meaning, and a mighty one, when opposed to all unnatural restrictions of the healthy development of any creature; the instinct of individual unrestraint that makes a slave burst his bonds, or a captive escape from his prison, will always cry out for sympathy. But beyond this, in the organization of social life, liberty has very little to do. On the contrary, the whole history of civilisation is a record of successive limitations of liberty, which we call laws. An old Scythian nomad, or modern gypsy, encamped on a Highland moor, and warning himself with the scattered spoils of the old pine forest, is a much more free man than any modern citizen of the most free country

* Republic.

in Europe. The civilised man grows, not by a large irregular liberty, but by the wise limitation of his range and the fruitful husbandry of his resources. The first condition of all effective social organization is discipline; but discipline implies subordination; and subordination means the recognition of a supreme authority. Destroy all reverence for such authority, and you produce that feverish, troubled, chaotic state of society which spends its force in continual convulsions and revolutions; while in the individual mind you beget that wanton revelling in the idea of unfettered individualism which wastes itself in noisy explosions against every power that would tame the fury or prune the rampancy of an imperious *I*.

But unlimited power and unlimited liberty are not the only social forces that are apt to run riot in the exaggerated assertion of the individual, and the negation of all superhuman authority. There is the irreverence begotten of the pride of intellect. In the exercise of intellectual, as of moral or physical power, there is apt to arise a certain selfish satisfaction in the exclusive dominancy of the knowing faculty above whatever else constitutes the sum of existence in the universe. Knowledge, of course, does not directly produce irreligion, or extinguish piety; on the contrary, the more a wise man knows of the universe, the more is he lost in admiration of its excellence, and in wonder at its mystery; for, as Plato said, wonder is truly a philosophical feeling; and to be full of a living knowledge of things as they are, in their proper relations and proportions, is simply to wonder and to worship. But the knowing faculty is not the whole of a living man, and to bring forth its healthy fruits it must go hand-in-hand with a rich moral nature; divorced from this, that will certainly show itself which St. Paul enunciates: "Knowledge puffeth up, but charity edifieth." In the exercise of the mind's cognitive faculty, isolated from a complete and well-balanced humanity, there is certainly no direct nourishment of the feeling of reverence. Who is more sharp than a lawyer? Who is more clever than a weekly reviewer? Mere knowledge is only one element in the building up of a sound mind. It is not merely that you know, but what you know, and how you know, and how you use your knowledge, that makes your knowledge a power—a legitimate power, let us rather say—otherwise it is a usurpation, and, like all illegitimate power, smothers that which it ought to protect. Everybody has read

Goethe's "Faust." What does that self-ventidition of a German soul to the Powers of evil mean? Faust, the speculative sinner, does not go to ruin, like Don Juan, in the Spanish opera, because he flings himself without limitation into the ocean of mere sensual indulgence, putting his private pleasure in the place of God's public order, and thus becoming practically an Atheist and a servant of the devil; but he goes to ruin, because he will not accept the bounds of thinking by which all finite being is necessarily confined. He must know everything; all the secret machinery of the universe must lie open to his gaze; the quick lightning of the blood shooting through the mysterious alleys of vitality, must be measured by his mortal optics; all which simply means, he scorns to be a man with men; he will be a god with gods; he will be his own god. He sets himself above the legitimate authority of that alone self-existent power which creates by limitation; and in doing so, he hands himself over to the destructive power which, by denying limitation, produces what such denial alone can produce, dissolution and chaos. Thus, in all intellectual, as in all other pride, the root of Atheism lies.

But there are various kinds of knowledge; and of all kinds, that which has long had the most evil reputation of begetting Atheism is Physical Science. *Tres medici duo Athei*. Is this a mere vulgar calumny, or is there any noticeable truth at the bottom of it? Very few such current proverbs are churned out of nothing; and that there is a certain connection between physical science and Atheism, the history of philosophy abundantly declares. Democritus of Abdera, the reputed father of the atomistic philosophy, afterwards taught in the Attic gardens of Gargettus with such applause by Epicurus, was the greatest naturalist of his age; and whatever may have been the personal opinions of the laughing sage with regard to the gods, there can be no doubt that the philosophical system expounded by his Attic disciple was utterly godless—worse than godless, indeed; for it is better to deny the gods altogether, than to shunt them off into a cloudy corner of the universe, and give them nothing to do but drink nectar and laugh at limping Vulcan. The explanation of the phenomena of the cosmos, by the various action and interaction of mere force and form which is the sum of the Epicurean doctrine, is pure Atheism, and indeed was meant to put religion out of the world altogether; as we see plainly enough from the tone of the opening

verses of Lucretius, in his celebrated Epicurean poem :—

"Tantum religio potuit suadere malorum!"

"Such cruel woes on mortals came from grim religion's power."

And a century before the time of Epicurus we find Aristophanes, in that most intellectual of farces already named, giving the most complete prominence to the fact that it was the physical philosophers who, with their talk about atoms and vortices, and collisions and explosions, and general turmoil of this battle of blind forces, were doing away with the notion of Jove altogether, and substituting happy accident for wise Providence. How far there was a fair apology, or at least a plausible palliative, for the physicists who made broad the phylacteries of this sort of talk long ago, we shall afterwards inquire. For those who revive the doctrine of the construction of a beautifully ordered world by the fortuitous concourse of atoms without mind, nowadays, there is certainly no excuse; but what concerns us specially to state here is, that there is something in the researches of physical science, at least in certain conditions of the intellectual atmosphere, not apparently favourable to the growth of piety and the cultivation of religious reverence. In reading certain of the psalms of David, which must be quite familiar to every English church-goer, one feels as if walking through a splendid picture-gallery, where not only the pictures are beautiful and grand beyond the power of human description, but, to compensate as it were for the feebleness of the attempt to describe them, the face of the artist is made to shine forth constantly behind the frame, and give a living inspiration and an intelligent presence to the scene. But in not a few of our modern physical science books, how different is the feeling! if, indeed, there is any feeling in the matter at all—anything beyond a curious fingering of wretched dumb details utterly destitute of soul. Whatever is in the book, depend upon it God is not there. You will hear no end of talk about laws and forces, developments and evolutions, metamorphic forms, and what not; but it is all dead—at least all blind. For seeing intellect and shaping reason there is no place in such systems. It is a mere shallow superstition, according to these gentlemen, to imagine any grand design in the system of the Cosmos. There is no construction; there is only a conglomeration, or at best a concatenation. That such Epicurean views are sported

nowadays on public platforms admits of no question; that when philosophically tested, and not allowed to veil their absurdity in a blue mist of fine phrases, they yield nothing but a physical-science variety of Atheism, is equally certain; and they naturally provoke us to the inquiry how such unreasoned drivel, after having been exploded for two thousand years, should be revived, and planted on the platform of boastful science as a new revelation which poor benighted humanity should now at length receive with a most grateful wonderment. Of this lamentable upshot of so much high-sounding talk, there are no doubt several causes; but under the present head of our discourse there fall only two to be specially mentioned. First, as before said, that the highest cognitions are never reached by the mere exercise of the knowing faculty, on whatever subject exercised. Instincts and aspirations are higher than knowledge; and the pretensions of the merely scientific man to assume the dictatorship of things that be are not founded on nature. Many things can be known only by being felt; all vital forces are fundamentally unknowable; but they exist not the less because philosopher B or philosopher C has no machinery with which to measure or to control them. Philosophy, itself the most abstract of the sciences, must, as Goethe profoundly remarks, be lived and loved, not merely tabulated and talked about; and so those who parade mere knowledge as the one thing needful are found at last, as the same Goethe says, counting the parts with their fingers when the spirit has fled. To the meagreness and inadequacy of these knowledge-mongers Wordsworth finely alludes in his description of the various classes of men who might be showing themselves beside the green sod of a poet's grave :—

"A moralist perchance appears,

Led, heaven knows how, to this poor sod:
And he hath neither eyes nor ears,
Himself his world and his own god.

"One to whose smooth-rubbed soul can cling
Nor form nor feeling, great or small;
A reasoning self-sufficing thing,
An intellectual all in all."

Here the great philosophic poet clearly indicates that without reverence and love, the mere man of science remains incapable of comprehending either humanity or divinity, becomes practically his own god; and is, in tone and temper, if not in abstract speculation, an Atheist. But it is of the physical science men that we are talking at present; and these also the thoughtful bard of the Lakes shows out from

the sacred presence of a true poet of nature, with a sharp tone of quiet contempt, as follows :—

"Physician art thou? one all eyes?
Philosopher? a lingering slave,
One that could peep and botanize
Upon his mother's grave!"

Of course general charges against whole classes of men are not for a moment to be understood here; but the writer takes a strongly-marked man of the type, and this, like "the girl of the period," serves the purpose, though a man may live largely in the period without perhaps meeting him or her more than once. But the physicist, by the very nature of his occupations, is unfavourably situated in regard to the knowledge of spiritual things. He is all eyes and all fingers; and confessedly neither with the fleshly eye can one see God, nor with the fleshly finger can one handle Him. And so it comes about that a physicist, when left to the meagre resources of his own science of externalities, may come not to believe in mind at all, and of course to deny God. Let him torture nature as he will, strike out all sorts of flashing electricities, pry curiously into the secret spring-work of vital machinery by monstrous vivisections, and yet he cannot lay his finger on God. There is therefore no God—nothing that he can lay his finger on; therefore nothing at all; only talk about laws and forces, and an eternal blind struggle of the stronger to kick the weaker out of the room. Such is the sad fashion by which the study of mere physical science, unelevated by a high religious philosophy, runs into the blank vacuities and blind fortuities of Atheism. It must always be so. No pyramid ever stood upon its apex, and no reasonable explanation of a reasonable world can be evolved from a tabulation of mere externalities. The kingdom of true knowledge, like the kingdom of heaven, is within. No philosophy worth the name was ever arrived at by external induction. By induction dead shells may be gathered, but the life of the soft-bodied creature which inhabits the shell is produced by the living power of Divine Reason, the soul of this mysteriously-ordered world, which eludes all microscopes to behold it, and defies all pincers to grasp.

I have spoken hitherto mainly about the men of physical science, because since Bacon, they have been making large their phylacteries in this country, and stirring the minds of men wonderfully. There are reasons for this; and for the brilliant antediluvian

and other discoveries which they have made, we may feel disposed kindly to forgive them a little nonsense. A wise man on a hobby-horse is never an edifying spectacle; but the creature delights himself for a lifetime perhaps, and we are amused for an hour. Let us now look in another direction. There is no nonsense like learned nonsense; and of all learned nonsense, metaphysical nonsense is the most extravagant. Of course among other forms of insane abstract speculation, we have metaphysical Atheism; and the father of this sort of nonsense, in modern times, was a Scotsman, David Hume. No man, of course, who has read his works will deny that Hume was a very clever fellow, a very agreeable, gentlemanly fellow too, and a man who combined a knowledge of books and a knowledge of men to an extent very rarely exhibited in the country which produced him; still he talked nonsense about causation, and about the ultimate cause; and this nonsense is to be traced in the case of the metaphysician, as in that of the physicist, ultimately to a want of reverence in his character, aided by a certain flatness, and shallowness, and want of earnestness in the age to which he belonged. With regard to metaphysical nonsense generally, and the Atheism which it will occasionally produce, we must bear in mind what Professor Ferrier says, in the first chapters of his profound work on Consciousness. Of all men, says that subtle and substantial thinker, the metaphysician is most apt to run himself into the blind alley of some inextricable absurdity; for he aims at explaining the very complex machinery of the vast universe by some one favourite principle, or method; and if this principle be either wrong in itself, or wrongly applied, or if it contains only one half the truth, or only a certain attitude and aspect of the truth, the whole of the ingeniously spun system becomes a gossamer web, not strong enough to hold a fly. What Hume said, for instance, about the comparison of a piece of human architecture, with the architecture of the universe, that we know everything about the one, and can know nothing about the other, is true only in so far as organized growth is a much more excellent and a much more divine thing than the best compacted masonry; manufactures of all kinds we can produce; growth of any kind, to the tiniest spot of grey lichen on a bare rock, no less than the branching foliage of tropical vegetation, defies the most cunning of our scientific appliances. Here no doubt is a gap; but on the other hand, the grand con-

gruities of eternal Reason shine out as plainly in the divine architecture as in the human ; and the intellectual process of the universe, which we call growth, is not the less intelligible because it is not mechanical, but only the more wonderful. Another of the pretty sophisms, with which the Scottish sceptic strangled his healthy human instinct, was that about causation. Of course what many superficial observers call a cause, is only a point in an invariable sequence ; it needed no philosopher to tell us this ; but when he, and a whole school of meagre puzzlers after him, tell us seriously that causation means only invariable sequence, we are inclined to subscribe to any nonsense in the Council of Trent, and to any horrors in the most damnable creed, rather than fill our bellies with such East wind, and believe it to contain any virtue that makes warm blood. There is not a sane man out of Bedlam who will not confess, when the thing is properly put before him, that the invariability of any sequence is just the very thing that renders the idea of a cause necessary : as necessary in fact to the constitution of a reasoned universe, as some fundamental axiom is to the proof of a mathematical theorem. But your metaphysician will not see this ; he must have a special transcendental region for himself, where he may make unhindered all sorts of abstract postures and somersets and curious antic wriggings, at which He who sitteth in heaven shall laugh ; and so rather than believe a creative mind with Moses, or a plastic reason with Plato, he sets himself in a pretentious wordy way to evolve all things out of a dark hollow centre of nothingness, and bind them together with a girdle of blank impenetrable necessity. Surely wise men, who talk such things, have been taken in the net of their own subtleties, while out of the mouths of babes, and sucklings, in modern as in ancient times, God hath perfected praise.

It is always more safe, in matters of healthy human sentiment, to trust to poets than to philosophers. A living sympathy with nature never can lead you far wrong. Men of the calibre of Homer, Shakespeare, Robert Burns, and Walter Scott, never strangle the broad realities of nature with ingenious and unsubstantial subtleties. A poet is naturally a religious animal ; we shall not, therefore, presumably expect Atheism from him ; nevertheless, we had Lucretius ; and some of our most brilliant notoriety in the modern world of song, are not the most notable for piety. Let us inquire, therefore, lastly, by what extrava-

gant and erring flight the bright-winged creature called a poet may sometimes be charmed away into the dim limbos and dark vortices of a godless cosmos. Other causes of such blind plunges will be noticed afterwards ; the present order of our discourse only calls on us to say, that there may be an idolatry of the imaginative, as well as of the knowing faculty. Reverence no doubt is as necessary to the complete poet as love ; and just as a man may have a grand swing of the imaginative faculty, and yet be wayward, wilful, and extremely selfish—like Lord Byron—so it is possible for a rhymist to have in his brain-chamber a perfect kaleidoscope of shifting beauties, and have nothing more, to lack that veneration for the grand central truth of the universe which gives elevation to all beauty, and significance to all variety. The Greeks had one very valuable idea, that a poet was always a σοφός, a wise man, and the best definition of poetry, to suit their practice, would be harmonious wisdom. But in our age of multiplied specialties, we are too apt to run after dexterity in artistical exhibition, without regard to health of tone, sanity of meaning, or naturalness of expression. Poetry, of course, as well as music and dancing, may luxuriate amply in this direction ; and the sacred art of the poet, of which the virtue is in truthful and vivid pictures to teach the wisdom of life, and justify the ways of God to man, may degenerate into a succession of dexterous pyrotechnic displays, and startling explosions of brilliant egotism, in which no worship dwells. Thus a practical divorce between poetry and piety may take place ; and though no direct war be proclaimed against religion—as in Lucretius—a pious man feels a sort of want in the effusions of poets of this defective type, somewhat as if one were to walk through Windsor Palace, and see splendid traces of everything but the Queen. Let the young poet, therefore, beware of glorying too much in his strength. A man may do anything, said the wise old octogenarian of Weimar, except live at random, “*sich gehen lassen*.” Floating about on rosy clouds for mere self-delection, or flashing forth in a series of iridescent coruscations for the amusement of those who seek for excitement, rather than improvement, will never exhaust the function of “the pious bards who speak things worthy of Phœbus.” To attain this dignity there must be a consecration of the whole man, his natural genius, and his acquired dexterities, to the service of the great Architect, in whose living temple the highest

honour the best of us can achieve is to be serviceable stones.

Thus much for Atheism, speculative or practical, declared and marked, or only insinuated and wavering, when viewed as proceeding from the want of a root of reverence in the character. In the next article I shall consider the phenomena of this abnormal state of mind, where it seems to spring rather from an exaggeration, or misdirection, than

from a deficiency of the noble emotion of wonder; and I shall then conclude with considering how far Atheism, or at least a want of natural piety, may in many cases be the rebound of an ill-balanced mind from the asperities and the rigidities of some local orthodoxy. If there is rebellion anywhere in a State, the Government is seldom altogether free from blame.

J. S. BLACKIE.

WE WERE CHILDREN ONCE.

WE were children when we thought
That the heavens were very near,
And that all our mothers taught
Would to-morrow be made clear;
When we questioned everywhere,
Dreading not a full reply,
When the world was just as fair,
And as distant as the sky.

When the marvels that we dreamed
Waited for our waking looks,
When our fairy fables seemed
Truer than our lesson-books;
When for all who well had striven,
Sweet the ready garlands grew,
And when sleeping, unforgiven,
Was what nobody could do.

We were children when we feared
Only darkness, never light,
For our troubles disappeared
Always, if they came in sight;
When our love was like our breath,
Ceaseless, natural, unperceived;
When we wondered about Death
As a thing to be believed;

When we drew a severing line,
Good from evil, night from day,
On the one side, all divine;
On the other—look away!
When our wrath was swift and sure,
Just because we seemed to know
Nothing wrong could touch the pure,
And our loved ones all were so.

When all weariness of life
Was but waiting for a bliss,
When all bitterness and strife
Could be finished with a kiss;
When all spoken words were meant,
When no promises could break,
When all storms were only sent
For the pretty rainbow's sake.

Over all the lovely scene
Necessary darkness flowed,
Now the years that intervene
Hide that once familiar road.
We remember all the way—
Oh, it was so fair, so dear!
Where it led we cannot say;
But we know it led not here.

For the labour wins no crown,
And the strong hope dies in pain,
And the twilight settles down,
And love comforts us in vain.
We have watered lifeless plants,
Falsehood fills the common air,
Every footstep disenchant,
There is parting everywhere.

Forest-doors are full of night;
Enter, and the path shall wind
As a string of tender light,
As a living wreath untwined;
Nature wastes no drop of dew,
Past the dying root it flows;
What you did you never knew,
Till there sprang a sudden rose.

Every branch breaks out in song
(All that birds say must be true),
Right grows in the heart of wrong—
Yours the task to let it through!
Every gathered leaf decays;
Wait for one immortal wreath!
What is love with life that plays
To the love that lives in death?

Twilight grows so sweet and clear,
We can tell that morn is nigh,
And our dead have come as near
As our childhood's happy sky.
Did the darkness only seem?
Was it all our own false will?
Was our life a little dream?
Father, are we children still?

M. B. SMEDLEY.

WHAT SHE CAME THROUGH.

BY THE AUTHOR OF "LADY BELL," ETC.

CHAPTER XII.—A NEW DAY'S-MAN AT THE MANOR.

IT was again spring, always late, cold, and bleak among those eastern downs—a prophesying the coast. The fogs from Holland, altered

nated with the whistling winds that blew over the German Ocean, lashing it to a fury, and raising on that long line of unsheltered sandy shore perfect whirlwinds of sand. These threatened to bury the inhabitants in their houses, as it buried their gardens, which were dug out annually.

Yet hardy fisher-folk and traders clung in great clusters for centuries—back even to the Danish invasion, to such towns as Cheam, and had thriven and flourished in them. There was as stout and faithful a population inland, who had settled on the bare, wide meadows, with deep ditches and slow streams, and who had fattened in them like their own oxen. Into strong, shrewd, stubborn natures they had taken the great, plain, unvarying traits of the landscape around them, and cherished it as far before the gardens of roses or frowning grandeur of mountains with which the imaginations of more sensitive people had on occasion tried to tickle the fancies of those dwellers in an eastern county.

There were not more staunch countrymen in all England. Not in soft and bold, flowery and rocky Devon, which, to complete its contrasts, breaks into vast moorlands—not in the bowery hop-gardens of Kent, or the

sunny wheat-fields and shady coppices of Berkshire, or the romantic glories of hill and dale in Derbyshire—was there a more home-loving, attached population than was to be found in that county to which belonged Cheam and Saxford. There were many such stirring coast-towns, the birthplace of ancient mariners and naval heroes of all time, with forests of shipping, old market-places, and fine old churches; and there were many such sturdy little villages, with small, square-towered, thatched-roofed churches and churchyards mossy and turfy, on the outskirts, and general stores for shops, and inns—half inns, half alehouses—for village centres.

As extremes meet, so in the extremes of prose in this land there was a curious, as it were unconscious, poetry, just as on its noisy, weather-worn quays, and in its crowded town lanes, and in some of its quiet, slumbrous halls and heavy, comfortable farm-houses, sad enough tragedies had been enacted.

And that late, cold spring-time of the east counties, which the very natives would deplore, had an unspeakable freshness in its blustering gales, and in the lingering frost-nips that contended with the increasing warmth of its sunshine, and with the springing sap of all life, such as no tender, balmy spring of the south or the west could command. It may be that it requires youth and health, or at least the recollections and associations of youth and health, to appreciate such rough, coy springs; but given the conditions, and no fair judge will deny that under all its disadvantages the much-belied east-coast spring has a charming something, invigorating and bracing, that is denied all other springs, and which is well-nigh worth their counterbalancing attractions.

A pedestrian who was in the neighbourhood of the Manor, and who, by the way, was not an east-countryman, revolved some of these thoughts. The flats were not dull, wearisome, and heavy beyond bearing, but in their wide space and monotony, their comparative emptiness and loneliness, had something of the impressiveness, and even something of the vague sadness, which captivates the wanderer among mountains. The chill of this spring-time was not mere grey cloudiness, piercing to the bone and marrow, but was also illumined pure blue, that got into

the blood and roused it to such sensibilities and raptures as mere soothing softness and mildness of atmosphere could never evoke.

The pedestrian was a young man who looked hardly more than a lad, save for a certain spring of manliness about him. By his dress he was of the working-class, and his fustians had been donned new and clean for the occasion. He was of the middle size, fairly but rather slightly built, with a face not so regular and correct of moulding as it was well-bronzed in colour and bright and pleasant in expression. He had lively dark eyes, which suited with what was seen of the wavy black hair, inclining to curl crisply under the straw-hat.

If this young fellow were on the tramp from one situation to another, or in search of work, he was not much pressed. He walked along with a light step, to take in the landscape in its mental and moral import, as well as in its bold outlines and practical statistics. He even paused to lean on a gate not far from the Manor-house, to watch a little cavalcade that approached it, coming home from field-work in the gathering twilight along a field-path by a ditch-side.

The party consisted of three or four out-workers, who might be a detachment from the main village-gang. The group was of the usual kind, even in the principal figures, which caught the gazer's eye. Perhaps because he was not altogether country-bred, the figures struck him. A tawny-haired young man, instead of riding his plough-horse walked by it and its fellow, on which was mounted a woman in a sun-bonnet and short skirts, sitting as on a side-saddle, though on the bare back of the horse, which jogged along with the slow, solemn pace of a work horse; the jingling accoutrements sounding through the stillness as it journeyed to its stable.

The man was between the stranger and the rider, so that he could not see the face of the amazon. He judged her to be young simply because the only other woman of the party was so old to be engaged in field-work that, had age been a title and not an impediment to such a progress, she would certainly have been the mounted woman.

As the group turned in before the way-farer, and took the road to the Manor, he followed in their track. He was just in time to see the rider alight, still with her back to him—lifted down by the principal man—when she went up to the head of the horse, put an arm for a moment lightly round its broad neck, and patted its long face with the other hand, as saying good

night, with thanks, to a familiar acquaintance, before she passed into the old house.

The stranger was now close to those who were left of the party—the old woman and a man as old, who were taking their way to an outhouse, and a younger man, who was about to help the leader to take the horses to the stable.

"You beant seeking quarters for the night here?" said the head man, interrogatively, first noticing and addressing the follower. "This here is a farm-house, but the willage is a little bit fudder on."

"Thank you," said the stranger, speaking clearly but slowly, and with a little hesitation. "Yes, I want quarters, to be sure. I suppose I shall get them at the first alehouse; but I should not object to a spell of work too, if any master hereabouts would take a stranger-fellow on to do an odd turn."

"A stranger in them parts," said Long Dick, as if he were confirming the other's statement so far. "I dunno know your face, and your tongue ain't ourn."

"I have lived a good deal in London," said the stranger; "you may call me a cockney chap, if you like, for I cannot take a mouthful of my words as you do, but must clip them short."

"Be you town-bred?" was the next question.

"Well, I ain't exactly either town or country bred, but part of both," said the stranger evasively, and reddening through the brown of his cheek. "If you wish to know what I have worked at, I've tried mechanics—but must I answer all these questions before I get an answer to my question, whether a day's-man is taken on at a time on this or any other neighbouring farm?"

"You are a cockie chap to go again a man axing where and what you 'a been when you are axing a place," said Long Dick, in the derisiveness of superior wisdom. "I take it you'll find fault next with me axing your name?"

"No—look here, mate, I call myself Joel Wray," said the man, with a laugh, either at his own unreasonableness, or from his sense of any little peculiarity in his name.

"And what may be turning you into the fields—we 'a enough of agricultural labourers in a general way—when you've been bred to mechanics, as you say? I suppose that be the carpentering and joining, or, as you seem a swellish sort of town feller," said Long Dick, with a slow smile, "you may 'a been in the cabinet-making line?" As he spoke Dick

gave a look at the other's hands, which had seen wind and weather like his face, but which were certainly not the horny hands of a labourer.

"I have made both cart-wheels and chairs and tables in my time," said the young man, with a little solemnity, as if his time had been that of a patriarch, and as if it cast a shadow backwards over him and his bronzed face and crisp curling black hair. "Now, I am inclined to do a little field-work for a change, and to try how you ploughmen-lads fare. I suppose you have no objection?"

"No, I han't; it would come ill off my hand," said Long Dick, candidly, "for I 'a liked change in my day, though I'm a sort on settled now; and that minds me that you are but a whipper-snapper, if I may call you so, of a young feller, with less hair on your face than I 'a, to speak of trying how us ploughmen-lads fare, as if you were a mighty sight above us in power and age."

"Forgive me," said Joel, not at all offended by being thus pulled up and brought to book. "It is a bad trick I have of speaking as if I were somebody. I suppose I caught it from being a widow's son, and living a good deal at home with my mother and sister. You know how women spoil a fellow. At the same time, is there not some saying about the quality of the goods not depending entirely on the size of the bundle? Now I dare say you beat all the country round in wrestling-matches," continued the speaker, surveying Dick's grand proportions with a mixture of admiration and undauntedness; "but if I were to have a throw with you, I should make some fight to keep my own."

"It's like you 'ould, for you d' be plucky," said Dick, not above being propitiated by the compliment to his physical supremacy. "I 'on't deny that I can keep my head, and I 'a kep it ere now; but them days are over with me," said Dick, assuming very much the same venerable tone which his companion had adopted and quickly dropped. "I 'a no more time for wrestling and boxing and sich riotous demeanours. I've as good as sobered down into a judge."

"Married, perhaps?" said Joel with a comical twinkle in his lively black eyes, which implied that he saw the giant in fancy a bond-slave to some mite of a woman.

"None so fast," said Long Dick, with shy but unmistakable pleasure in the suggestion; "not mated yet, but mappens nigh-hand it."

"Well, I wish you joy of the missus to be," said Joel, a little flippantly for so short an acquaintance, "and I won't keep you stand-

ing here all night; I must push on to get into quarters."

"Wait a bit," said Long Dick as the young man was moving off; "I can put you on getting a job for one day; we want to be through with the hoeing on the wheat in the Thirty-acre to-morrer. I know Muster Paul, that's our bailiff, won't have nowt to say again an odd hand; rudder the other way, if you'll put your shoulder to the hoe and dunna root-out weeds and plants at oncet. I'll send Ned here to the Brown Cow, where you'll put up, to rouse you and set you on the field afore six in the mornin'. What do you say to that?"

"Done," said Joel, "and I'll owe you a good turn some other day."

"Bor, he's flush with his good turns for a strange young man out on work," said Dick to himself, as he turned away with his vanity slightly wounded by having his patronage freely received and then as freely returned to him with a gratuitous payment in future favours, as given by an equal at least.

But Long Dick was not proud, as he would have said, and he rather took to this brisk young journeyman—cockney, as he had called himself, with his Hail-fellow-well-met and Jack-alike airs. Cockneys were strange cattle to Long Dick, who had a hankering to know more of them, while, as in the case of most slow people, such briskness of assertion and retort as this specimen had shown, proved an attraction for him. At the same time he was guilty of chuckling quietly at the notion of the mess the young mechanic would be likely to make of even so simple a country matter as wheat-hoeing; and if he stayed on and helped to load and unload a cart or two of miller's stuff or cattle-food, the Manor might show him what his mechanic's manhood was made of, set his legs tottering and his arms giving way, and him crying out for help, for as bold and conceited as he had been. "Serve him right and do him good," said Dick, compounding for the malice of the thought by the consideration, "His comb be too high for so young a cock, either in town or country; the sooner it's cropped the better for him, I pound it."

The next morning, in spite of Dick's having kept his word as to rousing the auxiliary, to his disgust, Joel Wray, the town and country mechanic, did not make his appearance in the Thirty-acre till the whole of the other workers had assembled and were hard at work.

The delinquent showed little shame for his remissness. "I'm about in time," he said, cheerfully looking round at his fellow-workers,

"which is saying a good deal for a first start on so raw a morning."

"To them as has cheek to make it, that may be an excuse," said Dick sharply, for he was now in harness at the head of his gang, and like Mrs. Balls, Dick in office and Dick out of office was a somewhat different person; "but I 'a heerd that a mechanic as was too late for his yard was fined and written down for every minute he lost to his master."

"I should think I know fines to my cost," said Joel shrugging his shoulders, and then he said no more, being occupied in taking up the hoe that was lying ready for him, and after quick observation proceeding to copy closely the practice of his next neighbour.

Of course he did it rather clumsily at first, and got into grief at short intervals, entangling his hoe with other hoes, making lunges forward and almost losing his balance in his zeal, pulling himself up and falling out of the row in the opposite direction, and annihilating not only the plants which must perish in the process, but those not destined for slaughter, so as to leave staring and gaping blanks in the regular rows of loosened and relieved wheat.

His operations were narrowly watched and highly appreciated by the village girls, who had assembled in full force, having been electrified by the news issuing from the Brown Cow, and circulating from end to end of Saxford ere bedtime the night before, that a strange working lad had come to the place and had been taken on for a day to help to do the wheat-hoeing in the Thirty-acre.

The announcement was like that of the arrival of a distinguished stranger at a watering-place hotel, who may be expected to join its table d'hôte, and show himself in the drawing-room in the evening.

And this was a case in which the stranger had few of his own sex to compete with, in preparing to take his part in the unfamiliar, crowded scene. Wheat-hoeing is for the most part given over to women, with a few men to direct, restrain, and generally rule over them. The men on this occasion were Long Dick—whose bow, if Dick cared to think so, was doubly strung, seeing he had not only a mistress and queen in Pleasance Hatton, but the humblest of slaves in Lizzie Blennerhasset—Ned Case, his underling, who was little better than a hobbledohoy, and was but one lad at the best, and old Miles Plum, the cattle-feeder, and he, besides being grizzled, wrinkled, and bent with age, had a grizzled, wrinkled, bent wife of his own working in the field.

It may be guessed what a treasure a new day's-man in the Thirty-acre was on this day to the Saxford girls. How gossip with regard to his age, his height, his saucy dark eyes and bold bearing, and town-bred polish and wit, had fairly exhausted itself, until the Blennerhasset girls and Sally Griffiths and Sue Case and the Prynnes had dared each other's open jeers and taunts, and outdone each other in getting up, at a moment's notice, something smart, a touch here and there of a red petticoat or a blue neckerchief in their ordinary soiled field-clothes.

These quick aspirants to his favour were prepared to sniggle a challenge to the stranger's awkwardness, to be followed by swift encouragement to any chatter and romping which the rules of the field and Long Dick's oversight would permit.

But there was something disappointing about the smart young town-journeyman; for all his smartness he showed himself simple in not seeing the approaches which were made to him, and in not responding to one of them.

The more boisterous and giddy of the girls were speedily mortified and in a manner put down by being forced to find that Joel Wray's whole attention was concentrated on his work, and that he was bent on overcoming its difficulties.

Long Dick in office was not more disposed to discretion and diligence in preserving discipline and ensuring industry than the volunteer was of his own accord. More than one rustic nose cocked itself indignantly while the corresponding head was tossed disdainfully, and the overlooked hoer muttered to herself or her next neighbour, "stoopid snail," an equivalent in east country dialect for muff or prig, while she gave a regretful sigh to the fact that so likely a young lad, fresh from Lun'on or some other great town, whom she should have supposed up to all gallantry, was so incapable of a country flirtation.

The morning was one of those pale grey mornings when the sun is silvery, not golden, and has as little effect in the matter of warmth as the moon; when there is a dense dew approaching to the whiteness of hoar frost on the grass and hedge-leaves; when the morning breeze has the asperity of salt in its blowing due east; such a morning as was apt to prevail even in the most favourable spring weather at Saxford and Cheam. Yet the wheat grew strong and hardy in the climate, and the very weeds, as Joel Wray found to his trouble—wild mustard, bugloss, wild chamomile—were of the toughest.

"Take care, Wray," said Long Dick warningly, as Joel made one of his lunges; "but you ain't making so bad a job of it for a beginner," he added benevolently, seeing that his assistant was willing to work, and feeling inclined to make some atonement for proposing to snap him up on account of his delay in turning out to work.

"It ain't very difficult," answered Joel with spirit, stopping and resting on his hoe, and always ready to talk; "it would be easy enough supposing you were used to it; it is only its long continuance which could be complained of. If it call forth skill, it should not be uninteresting, while it is a great deal better worth, being means to a useful end, than croquet, for instance—I mean cricket," said Joel, staring hard at the long stretches of meadows glittering under the low sun-rays on their thickly-beaded surface. "I take it there are famous cricket-grounds and cricket-players in this region."

"I take it there be," said Long Dick with a grin; "but we don't stop to speak on cricket or on nothink when we are wheat-hoeing; we keeps our breath for our works."

"All right," acquiesced Joel, returning instantly to his hoe, and going at the weeds doggedly.

The long row of hoers worked steadily for a while, and then when Long Dick was at the opposite end of the row, a girl next to Joel Wray said to her neighbour on the other hand, "Be Madam not coming out to-day?"

Joel started slightly at the question, and listened for the answer.

"Missus Balls has the rheumatiz, and has growed so fine that she wants a gal to do her house-work of a mornin' afore startin'; but yonder comes Pleasance, I do declare."

A young woman was advancing through the field to the workers, with the rays of the morning sun striking upon her without dazzling her or those who looked at her. She was dressed the same as the other women, except that her petticoat, instead of being red in colour, was purple like the bloom of heather, and for the usual rough jacket she wore a soft grey shawl crossed in front and knotted round her waist like a child's shawl. She had the same sun-bonnet, thick boots, and thick worsted gloves as the rest of the girls, for they were better off than the men in the last respect. Joel had found that manly custom required the men to work with their hands bare, and had had his hands grow swollen and blue in the surly cold.

The young woman had to pass in front of Joel; as she did so she glanced curiously at

him; while he, aroused by the nickname which the girls had given her, looked up from his work and stared full at her. To his surprise, almost to his consternation, he saw, irradiated by the silvery beams of the morning sun, a lovely young woman with a face full of health, spirit, and that refinement which is born only of intelligence. To put the finishing touch to the picture, while she had clearly prepared to take her share in the hoeing, she still wore such a pair of spectacles as men have a habit of associating with school lore and professional dignity.

Joel Wray,—who had his own antecedents and his own storehouse of associations in the midst of the widely-different surroundings—by a strange trick of thought recalled, not Tennyson's bucolic Amazons, who might have been appropriate in the field, but one of the Princess's "sweet girl graduates."

The new-comer crossed over to Long Dick, exchanging friendly greetings as she went, and then Joel guessed that she must be the woman whom he had seen riding home on one of Dick's plough-horses on the previous afternoon.

Dick came forward to meet her, and Joel heard her say to him in an anxious voice, speaking in a manner that had here and there a trace of the east-country accent with a country phrase, but was, still the unmistakable manner of speaking of an educated person,—

"What do you think of Daisy this morning, Dick? I'm sure she is better, though the flings ain't gone yet. She turned her head and looked at me as if she knew me when I went into the stall, and after I gave her the mash she wanted to rub her head against my arm."

"Wool, that be a good sign in itself," said Dick, more as if he were eager to gratify the girl than as if he had an assurance of the recovery of some horned favourite.

He made as if he would have her work next him, but she slipped by him, and took up her position near the old woman who had also been on the scene the day before.

The new girl began to hoe with the ease of a trained, vigorous young arm. Joel cast stealthy glances at her, for she puzzled and fascinated him, even to the risk of causing him to lose ground in the progress he was making.

The sun rose higher, and its young warmth began to be felt by the workers; their hum of conversation, which had arisen in spite of Long Dick's assertion that they kept their

breath for their "works," subsided, and left room for the larks' carols to fill the air.

Joel's arms began to ache, but the girl at whom he looked ever and anon betrayed no symptom of giving in. She worked steadily. Evidently she was not out upon trial like him, or working from some fancy, but on the same terms as her companions. When she stopped it was only to pick up the hoe which the older woman beside her had let the weeds drag out of her hand, and to give her a little help in demolishing a formidable group of rag-wort and thistles, and with that the girl resumed her own task, and plodded at it as if the plodding were the grand end of life.

Joel was not going to be beaten by a girl in spectacles with a tongue above her position, he was not going to be beaten by anybody. He did congratulate himself that his first bout of wheat hoeing was to be but for one day, but he managed to keep his aching arms in motion and to do some service for the wage that was in store for him, until the dinner-hour, when both the village and the Manor being near, the workers dispersed to their meal.

Joel did not suffer his arms to fall to his sides too obtrusively, but neither did he accompany any group on its way to rest and refreshment, and join in its discussion of that and similar day's work, and of day-labourers' interests generally, which would have been in better keeping with his pretensions. He felt a little discomfited, he could hardly tell why. In place of going back to the village he strolled away and sat down in solitude by the side of a ditch, and ate the bread and cheese and drank the bottle of ale with which he had, as he had judged, furnished himself orthodoxly. Then he shied pebbles at supposititious water-rats in the ditch, and watched yellow-hammers tapping at the snails in their shells in order to procure their dinner.

He was able to resume work a little refreshed, and to continue working, incited to endurance by the sight of the beautiful young woman in the knotted, grey shawl and spectacles, who had turned up duly with Long Dick and the lad, and the old man and woman, and had set herself to work as if she had been born to hoe wheat—which, for all the discrepancies that impressed Joel vividly, she might have been, and as if she did it with all the satisfaction in the world.

Just before the Thirty-acres field was cleaned, to Joel's secret relief, a little diversion occurred in the work; a hoer's hoe

struck on a nest of field-mice. A little exclamation and momentary gathering round the spot followed. To Joel's amusement, several of the working girls evinced as much repugnance, and even terror, as their sisters in a drawing-room might have betrayed on a similar excavation. The very old woman, who might be concluded beyond the age of affectation, cried out, though she had been used to beasties all her life, them sort allers made her feel creepy, and she could not agree with her sister who had once carried a pair in her pocket to a gentleman as wanted them for a favourite cat.

In the meantime Long Dick had taken up the young mice in his hand, and the girl in spectacles, in place of retreating like the most of her companions, was standing close to him, bending down to examine the vermin narrowly.

"What sleek little velvet coats, and what fine little paws, they've got, Dick!" she cried, in ecstasy, "and what bright little eyes!—they are past the blind stage—and what funny little noses!—they are a great deal prettier than either puppies or kittens."

"Should you like me to carry en to the Manor, Pleasance?" he said, answering a longing expression of her eyes; "you could put 'en in a cage and feed en on a little milk and crumbs, and tame en easy in no time."

"Like an organ-boy?" she said with a girlish, pleased laugh. "What would Mrs. Balls say? She says I am worse than any herd she ever knew with animals already?"

"Mor! never mind Missus Balls," said Dick smiling back on her, "I'll manage en."

The mice were laid aside and tied up securely in Dick's handkerchief, and the work of the field went on as before, while Joel Wray said to himself sardonically, "A sweetheart's offering from that fine-looking, giant lout to the missus to be; unmistakably she is his match in beauty; but what a strange young woman to make pets of mice! She is not a bit like a boy, either, except that she seems simple and frank in her way."

The hoeing of the field was finished within the afternoon, and the hoers accompanied Long Dick and the servants from the Manor in a round by the house before they went back to the village, in order to be paid for that and their week's previous work, by Lawyer Lockwood's bailiff, who had a room at the back of the Manor-house which he used as an office.

Joel Wray was following the rest, having

"WHAT SHE CAME THROUGH."

walked last, with the three men, in the rear of the girls, when Long Dick, having handed over the handkerchief full of mice to Pleasance, who received them tenderly and with the kindness and fearlessness of a born naturalist, decoyed the stranger lad to the barn, and told him to wait there till Ned yoked a cart which was to carry grain to a particular windmill.

"It ain't sundown," said Dick, "and we ain't a-goin' to go with the women, and call the afternoon's work made out by two hours and a bit's turn at such holiday-making as wheat hoeing. There d' be a fine breeze risin'; we be bound to take a yokin' on grain to Miller Morse's hopper to-night yet. You'll len' us a hand with the sacks, now, 'ont you?"

"Ay, I'm your man," said Joel, a little proudly, as if seeing through the mischief, and setting it at naught.

The cart was soon yoked, and brought in front of the barn-door, from which the sacks of grain were to be carried and put into the cart, to be conveyed thence to the mill. The horse in the cart stood obediently without any driver, while Long Dick and Ned went into the barn, and, bowing their backs like beasts of burden, pulled whole sack loads on their shoulders, and trudged out with them to the cart. Young Ned panted and laboured under his load, but Long Dick walked without a strain, and rose from under his burden, shaking himself, like a man who had felt the carriage more of a play than a toil.

Joel Wray came forward and succeeded in hoisting a sack on his back, nay, he walked, keeping a straight line with it, to the cart, and laid it down with its fellows, but when he turned round his sun-burned face was violently flushed, the sweat was hanging in drops on his forehead, and on his hands and wrists the sinews might be seen standing out like cords.

Ned and Long Dick took second loads, and Joel set his teeth and proposed to follow their example.

"He's game," said Dick, under his breath, half-pleased, half-disappointed.

"Dick!" called Pleasance. She had come out with some grain to the fowls, and was standing watching the men at a little distance. "Dick!" she said again, with more authority and reproach than she knew that she was expressing in her undertone, "don't let him; don't you see that he's not fit like you and Ned?"

But before Dick could do more, under his

own load, than give a half-stifed growl to Joel to desist, the latter had laid hold on the remaining sack, pulled it on to his shoulders, staggered with it somehow to the cart, and, having let it go, turned to Pleasance with a face as white as it had been red, and saying faintly, "Thank you; but I don't shirk any job that I've undertaken," made a motion to lift his straw hat, before he obeyed the bailiff's "Hie! hie! young man; do you want your day's wage?" from the open window of his room.

CHAPTER XIII.—DORA IN THE HARVEST FIELD.

THE new day's-man departed as he had come, on the day following that of his work in the wheat-field, leaving no trace of him behind, but he turned up again with the first days of harvest.

He told Long Dick, whom he came across, that he had been on the tramp all the time, except when he worked odd days to any farmer who would take him on.

His appearance coincided with his story. His moleskins were no more like the new suit that he had worn on his first arrival, than the uniform of a soldier who has seen a campaign is like the same uniform as it was put on spick and span from the regiment's tailor. His complexion, naturally brown, had acquired the nut and berry brownness of a gypsy, or an Italian, a tint which dark complexions take on, even in this country, from constant exposure to sun and weather, and which is quite distinct from the brick red that hot summers bring to such faces as Long Dick's.

Joel Wray also walked a little lame, which he explained by saying that he had over-walked himself. Young Ned who saw Wray's feet, bore his testimony that they had been blistered to the last degree and not attended to, and that even yet, it must require no small effort for him to walk in a country-man's boots.

But the spirit of the young man was unabated; he was as inclined as ever to propose to himself fresh adventures, as persuaded as ever that what man did, he could do, as prone to assert and defend himself; and when he was free to speak he had still a tongue of his own specially given to asking questions, in short, he reappeared as plucky and cheeky, as Long Dick had called him.

Now in no place, and in no circumstances, is the proverb that "a rolling stone gathers no moss" more weighty than in the country, among agricultural labourers. Even Long

Dick, who had tried his hand at more than one craft, and was fond of change and movement, held that it was no feather in the rover's cap, when the smart young mechanic proclaimed without hesitation, that he had been on the tramp, only doing odd days' work, and was still unsuited with a situation, for that matter did not seem desirous of finding one.

But even among the few corn-fields of the great pasture-lands, harvest coming on at once, far and near, made a rush on labourers. Neither had Long Dick seen anything in Joel Wray to qualify his first sneaking kindness for the brisk strange youngster who had gone far to prove that when he was engaged, he would work to the extreme limit, ay, and beyond the limit, of his ability.

Therefore Dick mentioned the stranger a second time to the bailiff, and the bailiff took Joel on readily in the exigency of the moment, and on Dick's word.

Joel had learned better behaviour in one respect. He did not sleep in on this occasion, but was up with the earliest, and abroad from the Brown Cow, and on the field of action, the special field of wheat which was to be cut, before a scythe or sickle had been put into it.

It might be that the golden glow of the sunshine, which was only deliciously tempered from its noontide fervour, on the July morning, did not demand such a sacrifice of ease and comfort even from a young mechanic, as the cold silveriness of the spring sunrise. Or it might be that a hardly acknowledged haunting curiosity and interest which had gone with the stranger and mixed itself up in all his dreams and devices, and had drawn him back to the same locality, led him out thus early on the chance of pleasing an idle fancy or of satisfying his inquisitiveness.

It was a splendid summer morning—all the more splendid that the excessive clearness of the atmosphere as if it had dropped all its dew on the earth, enabled a gazer to see miles, on every side, of emerald green pasture, with their herds of cattle and droves of horses—not a veil of haze, not a bank of grey or white cloud, fleecy or curdled, intervening, to break the remote blue line of the horizon. It did not bode good in the eyes of those were watching for fine weather.

Lawyer Lockwood had so far conformed to the march of time as to have scythes as well as sickles in employment on his fields. He must have made still farther concessions to public opinion and had a reaping-machine, except for the fact, that not only were his

corn-fields few, but that those of his neighbours being equally limited, there had been no room for the admission of more than one or two of those great overthrowers of harvest-customs, to arouse the wonder, envy and wrath of the population between Saxford and Cheam.

The scythes were for Long Dick, Ned, and old Miles Plum. Joel Wray had seized one, but he had been authoritatively ordered to lay it down.

"Do'ee want to cut off your own legs or ourn?" demanded Dick. "You may be used to saws and files, but you know you ain't used to mowing udder grass or corn."

And to the young man's mortification at first he was sentenced to a place and a sickle with the women, who cut the corn in their own division of the field, or else bound the corn which had been cut, after the men.

It was at the height of the milking and cheese-making season; but harvest, like marriage and death, according to old country customs, broke all other engagements. The milk at the Manor was saved up for days, and made into special cream and skim-milk cheeses, while not only Pleasance, but all the staff of village girls ordinarily engaged in the dairy, took part in what was wont to be coveted by young and old and middle-aged, over all the yearly round of labour, because with the work—and it was hard work under a hot sun, there came also the old-as-the-fields joy of the harvest, and the crowning triumph of the ingathering.

The women, to old Phillis Plum, were in more becoming while not less suitable dress, even without a reference to the heedless stranger journeyman, than that in which Joel had seen them at the hoeing. The season warranted it, and custom had established it. There was a standard fashion for the harvest-field as there is for a ball-room.

The women had discarded their heavy woollen clothing and put on gowns, many of them kept fresh for the first day of the harvest. Any jackets that were worn by the elder women were white or brightly striped. Aprons came under the same rule, being light in texture as well as in colour, fit to be rolled up round the waist, not to interfere with the wielding of the sickle or the binding of the sheaves, and to be let down over the lap to receive the food sent from the farm or the village, and eaten in the field, or to be gathered together to hold the heads of corn if gleanings were permitted as the last act on the field, the great spoils of which had been already carted into the farm-yard. The

sun-bonnets or hoods were also of lighter material, and were mostly white in colour. They were only trying to the older women. They made a far from unbecoming finish to the gay and tender patches of pink or blue or buff, in which a painter might miss rich depth of colour, but which to the ordinary looker-on were sweet as the tints of wild

roses, harebells, and primroses, into which the rest of the women's attire resolved itself.

Pleasance Hatton had a chintz-patterned gown, which, though it was of common calicot, looked dainty and cheerful as the flower of the little eye-bright. Her tucked-up apron was white, like the aprons of squires' madams and dames and duchesses of centuries gone,

Page 252.

and as she was fond of having her aprons; for she would say if aprons would not wash, she did not see what use they could be for; she could not abide an apron which was not of washing stuff.

Her white hood shaded a face like a Hebe's, with something of a youthful Minerva's in it, whether the last something were a lingering reflection of the spectacles, which were not worn on the present occasion, or of the

breadth of forehead between the hazel grey eyes, that the spectacles often aided.

Joel Wray found that he had not been mistaken in his estimation of her remarkable face and bearing. He concealed his feelings, but he could have gazed upon her like one entranced. She remembered him as the young mechanic who had joined them for a day in the spring time, and who had stood up gallantly to his work when it threatened

to be too much for his strength and training. She gave him a smile and a little friendly nod of recognition, which filled him with delight.

Long Dick proposed that she should be of the party who bound after the scythes; but she said no, she wanted to prove her skill with the sickle.

"She ain't the missus that was to be—not yet," said Joel Wray to himself, with a sense of relief and satisfaction as illogical and incoherent as the phrase.

Then Joel placed himself with alacrity, like Hercules among Omphale's women, contriving boldly that his station should be between Pleasance and old Phillis Plum's; and the work commenced. There was no room for conversation as the reapers grasped handfuls of the russet straw, and stored sheaf after sheaf on the newly-made stubble. Joel was content not only with the sunny fields, the wealth of grain, the corn-cockle, blue-bottle, poppy, and marigold that flecked it with brilliant blossoms, but with watching the busy-handed, blythe-hearted young woman beside him, and comparing her in his fancy to Nausicaa, to Hermann's Dorothea, to Eppie in the Bothie with the Highland name. His mass of desultory reading had furnished him with widely-varying comparisons, at least as abundant and available as the mechanics' institutes and libraries scattered broadcast over the country.

The first interruption was the cruel roughness and sharpness of the stubble, which caused him, limping already as he stepped forward, keeping pace with the waving line, to swerve beyond concealment.

"Ah, Ned has told us," she said, addressing him with hurried softness and pity, for she could not help observing and being slightly disturbed by his close study of her, "you have been over-walking yourself; but you are to stay with Miles Plum at the offices to-night, to save you from having to go and come from the village, and we shall make dressings for those poor feet of yours, so that they shall not pain you much to-morrow."

Joel, a little subdued in his irrepressible frankness and confidence, murmured his thanks gratefully, begging her not to speak or think of troubling herself for so small an evil on his part; and withal he looked his thanks still more than he spoke them, so that Pleasance said no more, though she could not regret what she had said.

The next thing was her surreptitiously observing the struggle which he made with

his pain and his awkwardness—for he was as awkward at corn-cutting as at wheat-hoeing—to keep himself up to the mark of the women, and to do at least as much work as they did.

Pleasance did not say anything, for the stranger lad was but the very slightest acquaintance of hers; and besides, in her intuitive delicacy and sympathy, she felt that he was vexed already at having to maintain such a struggle, and that he would be still more vexed if attention were called to it, or if it were as much as spoken of between her and him.

But though Pleasance said nothing, she thought the more; and it may be recorded of her with regard to this thought, that if women have an extravagant admiration for bodily strength and skill in a man, they are touched in another way, even to the quick, to see a man do brave battle against odds, with a true man's spirit that yet exceeds his strength and his skill.

The third thing was, that in giving a desperate stroke Joel Wray cut himself sharply just above the wrist.

Pleasance cried out, "I was afraid you would do that," and then stopped, blushing, but she did not stop acting: she quickly took her handkerchief from her pocket and proceeded to tie up the wound.

"It is nothing," he said, almost gruffly; and it was a cut as shallow as it was sharp, but he suffered her to stanch the bleeding and protect the injury by the folds and knot of her handkerchief, thinking that if it had been artery that had been cut, she would have sprung to him, or to any man or woman on the field, to compress it and bind it together, with the same quivering closed lips, and eyes with the moisture held back in them, careless for the pain to herself, only bent on serving another in such a ministration.

In a few moments he was at work again, with her working by his side, and, as he told himself with a foolish boyish thrill, having her token on his arm.

At mid-day came the hour's rest and the meal, eaten only on harvest and hay-making occasions on the field. The rarity of the circumstance, together with the harvest atmosphere, gave it somewhat of a festival character, to which Mrs. Balls, with sundry elderly assistants who were appointed to provide the refreshments, did their best to contribute, by supplying full pitchers of cyder and great piles of bread and cheese.

The repose as well as the food was wel-

come—a hundredfold more welcome than it could be at a picnic, as that queer fish Joel Wray reflected.

There was not much leisure, to be sure, to look around and see how the "field" employed itself. After having cleared away the victuals with the magic celerity of healthy appetites set on edge by a long morning's work, the lad Ned and some of the women spurred on old Miles Plum to spend a little of his scant remaining breath in a quavering song, the beginning and end of which was a lavish encomium on a highly estimable grey mare. A few of the younger girls got up and strolled away to pull straws and blow away dandelion seeds, in order to tell each other's fortunes.

Dispatch was necessary for these feats, in which not all the company were privileged to join; for just before the conclusion of the first spell of work, Long Dick's scythe broke, and he was forced to go off with it, reproaching his fate, to have it mended in his uncle's smithy, where Lizzie Blennerhasset would gladly find him a bite to eat in lieu of the harvest meal which he lost.

"It is an ill-wind which blows nobody good," reflected Joel Wray, irrelevantly; and undoubtedly Long Dick was saved from some annoyance, for the stranger hovered round and kept by Pleasance Hatton, in the interval, in a manner which the quick village gossips began to remark.

It seemed only one or two blissful minutes to Joel Wray, that he sat beside Pleasance Hatton—not indeed outwardly apart from the others, only at one end of the semicircle, with the waving corn summoning them to fresh exertions behind them, and the field with its trophies of sheaves and ricks, the far-reaching pastures, the windmills, and the barges coming and going on the stream before them—surely the most peaceful of country landscapes.

Joel's tongue, which had been tied by a rush of feelings early in the day, was loosed now, and he talked freely and fluently, in his sharply clipped, smoothly rounded speech, which had such an echo of Pleasance's own.

Oh, how perilously winning was that ready, intelligent talk to Pleasance, coming upon her as if with the revival of old equal intercourse, which was no sooner heard than it filled her with a yearning sense of the vacancy and isolation that had preceded the unlooked for experience! It came upon her with the sharp joy of surprise and the bliss of wonder. Yet Joel Wray was saying

no more than did she not think spare old Miles Plum—now that he had finished his poetic praise of his grey mare, and was whetting his scythe—was like the figure of death on a tombstone? And were not the shapes and voices of the children who had strayed up from the village ostensibly with messages to their mothers and sisters, in reality drawn by the universal attraction of the harvest field, well matched with the scene?

One of the children, a pretty little toddling boy, belonged to the daughter of the bailiff—the last a stout figure in farmer's garb of grey coat, and grey hat, with a resolute mottled face and wiry whiskers,—had just come on the field, to see how the work was progressing. The daughter, somewhat more refined than the ordinary women around her, half way between a rustic and a lady, had followed her father with a letter which had arrived for him and required an answer. Her child seeing his grandfather, ran and clasped the familiar knees, holding up the little fists clenched upon all the flowers which they were able to hold.

Pleasance's and Wray's eyes fell simultaneously on the group, and simultaneously they turned with a flash of pleased recognition to each other. "Dora," exclaimed Wray. "Grandpapa's Flowers," exclaimed Pleasance.

"I saw the play acted in one of the theatres before I left London; it is very popular," said Joel, clearing his throat.

"I read the story first by Mary Russel Mitford, and then by Tennyson. I used to read Miss Mitford's stories, and I have Tennyson's earlier poems," said Pleasance, quite naturally and easily, so long accustomed to the discrepancies between her education and her position, that she had quite forgotten how they would strike a stranger.

He looked amazed and stared for a moment, and then he said—

"Oh, I suppose you have good working people's libraries in the country, as well as in the town."

"No," she said, "I am sorry to say there are not, and I should be sorrier, but that grown-up people in our class hardly read at all in the country, at least that is my experience. The vicar has a Sunday-school library which serves the boys and girls as long as they continue at school; after they leave it they mostly give up reading."

"But you—" he ventured and paused.

She did not seem to look upon the obser-

vation as a liberty, though a little reserve stole over her in her answer.

"I was not educated here, and I have a number of books—they seem a number in this quarter," she corrected herself with a little laugh, "I read them still when I have spare time. The theatre must stand in the place of books to many people, and must teach them many things very delightfully."

He wondered if she were laughing at him, and if there were not only native intelligence so far cultivated, but sarcasm in the thoughtful eyes. But she was looking at him quite simply, and he guessed that while she might have a little book knowledge, of which she had made the most, she was in a delusion about the theatre, supposing it a place where historical dramas and moving moral tragedies were acted for the instruction and improvement of the people.

He did not wish to undeceive and disappoint her, he felt instinctively that she would be disappointed if he told her, that the theatre was a place where people went only to be entertained. She might say next, was not instruction—instruction not in science and art, but in greater human truths, struggles and conquests, the highest and best entertainment, or make some other equally wise, unanswerable speech? There was no wise speech with which he would not credit those flexible yet firm lips.

He preferred to say evasively, where her last sentence was concerned, "The 'Dora' that I saw played, was neither written by Miss Mitford nor by Tennyson, but by one Charles Reade."

"How odd that they should all three choose the same simple little text!" she said. "But don't you think that writers must all go back to first duties as well as to first feelings?"

He was saved an answer by the signal for the harvest work to recommence.

CHAPTER XIV.—POPE'S LOVERS IN THE STORM.

As the afternoon wore on, Joel, who had not only warmed to his work, but had won a certain amount of ease and skill in it, began to show the superiority in lasting power of men's to women's muscles. Some of the most active and vigorous women in the morning were beginning to lag a little and look wistfully at the sun's progress, still they worked on, trained as they were to enduring toil, with Pleasance among them; but it was Joel's turn to gain ground and get ahead and leave the laggards behind him. Pleasance did not look annoyed to be thus beaten; she

did not let him have an easy victory; she strove her best to maintain her place, but when she began to feel herself worsted she submitted with a good grace, which was not the least gracious thing about her in his eyes.

"She is no virago, she is as womanly as she is strong and brave," he thought.

All in a moment the clear cloudless sky of the morning, into which great piles and mountain peaks of clouds, still snow-white, had entered ere noon, became dark, and a cool almost chill wind blew upon the heated workers. Looking up to ascertain the reason of the change, the spectacle was presented of these mighty cloud masses—an hour ago so white and radiant with sun-light—in one quarter of the sky hanging low over head, and of an inky blackness, and in the opposite direction presenting a lividly pale border which formed a dense dull grey pall extending to the verge of the horizon. Before one could say "a storm is coming," the forked lightning leaped in a jagged stream from the black cloud, a thunder peal crashed after it, and the first great drops of a torrent of rain caused the workers to look round for the nearest shelter. The readiest idea, so natural on such an occasion that it occurred to most of the women at once, was to pull together and pile up the sheaves and to crouch behind them. So rapidly was it put in practice, that in a few moments, before Long Dick who had returned to the field could hurry from the farther end to the women's side, sheaves and ricks presented the same phenomenon as that offered by the bracken bushes on the hillside the moment after Roderick Dhu, having called forth his plaided host to startle the eyes of the Knight of Snowdon, had waved them back again into utter invisibility. Not a woman was to be seen, and Joel Wray had vanished with them.

Joel had drawn Pleasance into a nook formed by the sheaves, and divided by its barrier of straw, from the nooks in which the rest of the women were ensconced.

The couple were hardly a stone's throw from the others, and yet Joel felt and welcomed the feeling with a conscious exultation as if they two were alone in the storm.

Pleasance might have a similar delusion, she grew rosy red, whether from work or the agitation of the moment, and she looked silently at the flashes of lightning which broke through the rain that hissed and seemed to ascend again in white steam, as it poured, and listened to the rattle of the

thunder. "You are not frightened, Pleasance?" he asked her softly, venturing to call her by her Christian name.

She took no notice of what was the universal practice around her, yet a watcher, watching narrowly, might have seen that though Long Dick and everybody she had known for many a day had called her Pleasance, still when this stranger followed their example, the slightest quiver passed over her, and her eyelids drooped for an instant. "Not very," she said, simply, "it is grand, but it is awful."

They were silent again for some minutes while the storm rolled on. When he spoke next, he was moved by a quick impulse. "Have you ever read Pope among your other books?"

"No," she replied, "unless in the little bits in my 'General Literature.' There were 'Belinda's Toilet' and the 'Dying Christian,' very different specimens."

"But it was not of either of them that I was thinking," he said, "it was of the description of a man and a woman struck dead by lightning in such a field as this."

"Oh! dear, what a terrible recollection!" she said, with a natural shudder.

"But it was not so terrible, not so sad, at least as you think," he explained, eagerly; "they died together, in a moment. Don't you think," he hesitated, "that there are people in the world who would like to die thus—that there are experiences in this life worse than death?"

"Ah yes, it is hard for those who are left behind," she said, thinking of herself and Anne. "I had a sister who died, and I wished that I could have died with her." When Pleasance recalled and dwelt on the conversation afterwards, she wondered that she could have spoken of Anne's death to a stranger, she shrank from what she had said as if it had been a sacrilege, committed against Anne's memory, and still it had felt no sacrilege at the moment.

"There are relations nearer and dearer than sisters," he said, and stopped abruptly.

And Pleasance knew, though she had never read of Pope's stricken and slain lovers, that it had been true lovers who had been united in an instantaneous fiery death. Her heart palpitated in the silence. Yes, she could comprehend what mercy, nay, what unearthly bliss, there might be in such a death; and this young, glib, brown lad beside her, who had nothing at all of the gloomy hero of romance about him, in whose manliness there was something light-

heartedly boyish in its very self-assertion and jauntiness, whose will had been greater than his ability, comprehended the existence of deep passion also.

Soon the air became perceptibly lighter, and a ray of wan and watery sunshine darted suddenly across the gloom to replace the lightning. The rain had lessened, and was gradually ceasing, the hidden reapers began to creep out of their shelter, and to look around them to see if the storm were passing altogether, and prepare to resume their work.

As Pleasance and Joel Wray came forth from their refuge, meaning glances and speeches were exchanged freely by the women. In that comparatively primitive society men and women not only leapt, like children, to rapid conclusions, but proclaimed these conclusions with equally childish candour.

"You be goin' to 'a mor'n one string to your bow, Pleasance," said one young woman sarcastically.

"Mor, us will see what Long Dick will 'a to say to galiwantin' ways," said a matron warningly.

"You 'ad better not put out a finger to touch some folk's goods, young man, if so be you want to keep a whole skin," another motherly woman told Joel Wray.

Both Pleasance and Joel knew in a moment, with burning cheeks and two pairs of eyes that sparkled and gleamed with anger and other feelings in the anger, what was meant, but neither answered the soft impeachment in direct words. Joel said something lightly and defiantly of being able to take care of his own bones, and of this being a free country, where cats could look at kings, and any man might offer any woman an umbrella or its equivalent.

They did not separate, not even so far as the exigences of the field-work might have permitted. Joel did not move an inch from Pleasance's side, and Pleasance, with equal pride, would let him work in the same proximity that they had preserved all the day, while she turned blind eyes and deaf ears to the gathering gloom and surly growls of Long Dick every time his path crossed theirs.

But though she kept a calm front before what was fast becoming the gossip of the field, and to what it might tend, though she even talked and laughed fast and at random because of it, there was a tumult within her, by no means lessened because of the distinct consciousness that, far beyond any anger at

what she regarded as the uncalled-for and rude remarks of her associates, there ran through her a thrill of delight at their prophetic truth.

She was more proud than ashamed of being distinguished by this lad, who was but a working lad like the rest, and yet who was so different from them, and had so much in common with herself, that there was to her a glamour of enchantment about him. And she had never been made proud—only a little vain, perhaps, and with her better feelings touched, by being distinguished, long and sedulously, by poor Dick Blennerhasset. She had a vivid conception which she half resisted, half admitted, in the midst of her indignation and confusion, that this harvest day, with its toil and rest, its splendour and storm, was the happiest day she had ever known.

She recognised with glad humility that he was not offended by the implication which had coupled their names together. So far from its driving him away from her, it was causing him to abide more unmistakably, and more openly, at her side, while with passionate, long side-looks, he was seeking continually to catch her eye, and to tell her silently what abandonment he owned the charge, and how he besought her to grant him grace by responding, however faintly, to his dawning love.

By the time that Pleasance got back to the Manor-house, escorted to the door without any strong rebuff on her part, by the stranger, Joel Wray, the news had travelled to Mrs. Balls. Pleasance had got a new young man, who had been making up to her all the day in the boldest and most marked manner, and to whom Pleasance, who, unassuming as she was, had the reputation of being particular, and who had kept the great match of the parish, Long Dick, at the staff's end for years, was giving evident encouragement.

Mrs. Balls, having her own castles in the air, in which Long Dick figured as master, in a way that was so assuring and "com'able," was much taken aback and disturbed by this *contretemps*. Thus she also, by her manner, confirmed the view which their other acquaintances had taken, and made Pleasance and the young man feel that her glumness and testiness to Pleasance were all because of the report that had preceded her and the company in which she had come. The flame of love at once discovered, spoken of, opposed, had all that current of air lent to it which other flames require in order to fan them into rapid growth.

Pleasance had promised to send Joel Wray balsam for his smarting feet, as she would have sought to comfort any fellow-creature in need of comfort, and she would not break her promise because of what had come of it.

"Please yourself," Mrs. Balls had said ungraciously, when the proposal was made to her of supplying the relief. "I 'ould let him go and get his blistered feet cured where he came from. What are mechanics—an' he be a mechanic—doing a-strolling about the country like players, takin' honest folk's work over their heads, and their bites out on their mouths. We wants none on them—no, not at harvest time. It is a temptin' on Providence not to take time, and be content with the hands as we 'a knowed all our days. A black-a-vised tanned jumper of a young man as will be here to-day and gone to-morrow. Phillis Plum can do what she likes with his feet, athout you slasterin' and sendin' messes. If I were you, Pleasance, I 'ould 'a nowt to say to his feet. What are his feet mor'n other feet? He 'a been walkin' a many days? The more shame to him; let him walk hisself off to where he started from, an' he dare go back, for it's like enough he started on such a wild-goose chase with a flea in his lug. That's all I a' to say. But you are like the rest on the gals that are women-grown, Pleasance; though you 'a book know and were better bred, you'll 'a your way; but an you wunno take care you'll repent on it. It's ill takin' up with a stranger, even when you dunno slight his betters. Your mother knowed that afore she went out on the world, though she had the luck to marry a gen'leman."

Joel came over within the hour of Phillis Plum's receiving the application from Pleasance, to thank her warmly for remembering and desiring to minister to his pain. Churlishly as Mrs. Balls felt inclined to conduct herself towards him, she could not refuse to receive an acquaintance of Pleasance Hatton's; indeed Mrs. Balls had been the first to acknowledge that, according to the freedom granted to working men and women, Pleasance had a right to please herself in the acquaintance.

In addition, disgusted and alarmed as Mrs. Balls was, she could not have the stranger in the Manor kitchen without talking to him, and she could not see him stare at Pleasance's last little drawings fluttering on various parts of the walls, above the dresser, in the window recess, and on the mantelpiece, without asking him, with consequential complacency, to look at them.

"I dessay you beant accustomed to draw-
ingses, any more than to beasteses, but you
can tell a colt or a pup when you see 'en, I
suppose?"

Pleasance had not advanced a single step
in art, except perhaps that she took rough like-
nesses with greater facility and celerity than
ever. But certainly the parson and Lawyer
Lockwood might have been at rest, for she
had not spoilt a good dairywoman and house-
keeper by aspiring to be a tenth-rate artist.

Joel Wray was looking at the drawings
with a bright smile. "I recognise every one
of the originals," he said, "and I could not
do the like, though I have learnt enough
drawing to point out most of the wrong
strokes. We have so many schools of art,"
he explained, "which many fellows attend in
the evenings, since it helps them in most of
their trades."

"If the picters are as like what they are
meant for as one pea to anudder, I dunno
see where the wrongness can lie," said Mrs.
Balls, stiffly paying no attention to his ex-
planation, and thinking within herself, "a
fault-findin' jackanapes and whipper-snapper.
This do come to open Pleasance's eyes,
sure-ly."

But Pleasance was only glancing shyly at
the critic, and reflecting how well he looked
in this light, brown as he was and of no great
build for a man, but he must have been finely
knit, for he stood and sat and leant against the
window with the ease and grace which showed
what town breeding and its amount of educa-
tion could do, even for a working man, while
he owed no advantage to dress, for of course
he wore his working-dress, he had only

washed his face and hands and combed his
hair, as Pleasance had done for herself, in
the interval since they had parted..

"You read and you draw in midst of your
hard work," said Joel, enthusiastically; "are
you musical too?" and he looked round as
if he expected to see a piano or an organ.

"Oh no," said Pleasance, laughing frankly,
"I have forgotten all my music except what
belongs to humming a tune. I have hardly
voice for the simplest song. I wish I had,
for then I could sing as I worked, when I
had breath to spare. But if you are fond of
music you should hear Clem Blennerhasset
and his fiddle; it reminds me of what I learnt
about Orpheus in our old mythology lesson."

"Is this Clem Blennerhasset a friend of
yours?" asked Joel, with a shade of reserve
and vexation in his voice.

"He is the brother of my friend Lizzie
Blennerhasset," replied Pleasance, demurely,
enjoying, without analyzing the enjoyment,
the suspicion of restlessness and annoyance
which she had provoked.

"Clem Blennerhasset 'ad better learn to
earn his bread afore he plays his whistle," in-
terposed Mrs. Balls innocently; "a great
wambling boy like he should be thinking of
gettin' out of's apprenticeship and ceasin' to
be tied to smith Blennerhasset's apron, instead
of fiddlin away every hap'orth of his spare
time. I d' know his mother is fretted to fiddle-
strings with his fiddlin'."

"Ah, I must hear this boy fiddler," said
Joel heartily, with a look of mingled relief
and reproach at Pleasance, which she met
with a slight laugh, though she could not
have told why she laughed the low laugh.

PERFECT PEACE.

LIKE a river glorious
Is God's perfect peace,
Over all victorious
In its bright increase.
Perfect, yet it floweth
Fuller every day;
Perfect, yet it groweth
Deeper all the way.
Chorus—Stayed upon Jehovah,
Hearts are fully blest,
Finding, as He promised,
Perfect peace and rest.

Hidden in the hollow
Of His blessed hand,
Never foe can follow,
Never traitor stand.

Not a surge of worry,
Not a shade of care,
Not a blast of hurry,
Touch the spirit there.
Chorus—Stayed upon Jehovah, &c.

Every joy or trial
Falleth from above,
Traced upon our dial
By the Sun of Love.
We may trust Him solely
All for us to do;
They who trust Him wholly
Find Him wholly true.
Chorus—Stayed upon Jehovah, &c.

FRANCES RIDLEY HAVERGAL.

THE CHEVIOT HILLS.

By JAMES GEIKIE, F.R.S.

III.

SOME reference was made in a previous paper (see p. 12) to the general appearance presented by the valleys of the Cheviots. In their upper reaches they are often rough and rocky; narrow dells, in fact, flanked with steep shingle-covered slopes, and occasionally overlooked by beetling crags or fringed with lofty scaurs of decomposing rocks. As we follow down the valleys they gradually widen out; the hill-slopes becoming less steep and retiring from the stream so as to leave a narrow strip of meadow-land through which the clear waters canter gaily on to the low grounds of the Teviot. In their middle reaches these upland dales are not infrequently well cultivated to a considerable height, as in the districts between Hownam and Morebattle, and between Belford and Yetholm—the former in the valley of the Kale, and the latter in that of the Bowmont. It is noticeable that the narrower and steeper reaches all lie among Silurian strata and Old Red Sandstone porphyrites. No sooner do we leave the regions occupied by these tough and hard rock-masses than the whole aspect of the scenery changes. The surrounding hills immediately lose in height and fall away into a softly undulating country, through which the streams and rivers have dug for themselves deep romantic channels. Nevertheless, it is a fact, as we shall see by-and-by, that south-west of the region occupied by the igneous rocks of the Cheviot Hills, all the higher portions of the range (Hungry Law, Carter Fell, Peel Fell, &c.) are built up of sandstones. For the present, however, I confine attention to those valleys whose upper reaches lie either wholly or in part among igneous rocks or Silurian strata. A typical and certainly the most beautiful example is furnished us by the vale of the river Jed. This stream rises among the sandstone heights which have just been mentioned as composing the south-west portion of the Cheviot range. The first seven or eight miles of its course leads us through a broad open valley, which has been hollowed out almost exclusively in sandstones and shales; by-and-by, however, it takes us into a Silurian tract, and thereupon the valley contracts and the hill-slopes descend more steeply to the stream. But we soon leave the grassy glades of this

Silurian tract and enter all at once upon what may be termed the lower reaches of the Jed. No longer cooped up in the rocky gully which it has painfully worn for itself in the hard greywacké and shales, this stream now winds through a much deeper and broader channel which has evidently been excavated with greater ease. High precipitous banks and scaurs now overlook the river at every bend, the banks becoming higher and higher and retiring further and further from each other, as the water glides on its way, until at last they fairly open upon the broad vale of the Teviot. Sometimes the river flows along one side of its valley for a considerable distance, and whenever this is the case, it gives us a line of bold cliffs which are usually flanked on the opposite side by sloping ground. This is the general character of all valleys of erosion, and especially of the lower reaches of the Jed.

A glance at the cliffs and scaurs of the Jed shows that they consist of horizontal or gently undulating strata of soft earthy, friable, shaly sandstone, arranged in thin beds and bands, which alternate rapidly with crumbling, sandy, and earthy shales; the whole forming a loose and unconsolidated mass that readily becomes a prey to the action of the weather, rain, frost, and running water. The prevailing colour is a dull red, but pale yellow, white, green, and purple discolorations are visible when the strata are closely scanned. The finest sections occur between Glen Douglas and Inchbonnie, and at Mossburnford, but the cliffs throughout present the same general appearance, and are picturesque in the highest degree. Everywhere the banks are thickly wooded, and even the steep red scaurs are dashed and flecked with greenery, which droops and springs from every ledge and crevice in which a root can fix itself. How vivid and striking is the contrast between the fresh delicate green of early summer and the rich warm tint of these rocks which when lit up by the setting sun seem almost to glow and burn! Well may the good folks of Jedburgh be proud of the lovely valley in which their lot is cast. In no similar district in Scotland will the artist meet with a greater number of such "delicious bits," in which all the charms of wood

and water, of meadow and rock are so harmoniously combined. It is not with the scenic beauties of the Jed, however, that we have at present to do. I wish the reader to examine with me certain appearances visible at the base of the red beds, where these rest upon those older rocks which have formed the subject of preceding papers. In the bed of the river at Jedburgh, we see the junction between the red beds and the Silurian strata, and may observe how the bottom portions of the former, which repose immediately upon the greywackés, are abundantly charged with well-rounded and water-worn stones. Many of these stones consist of greywacké, hardened grit, and other kinds of rock, and most of them undoubtedly have been derived from Silurian strata. In other districts where the old igneous rocks of the Cheviots form the pavement upon which the red beds repose, the stones in the lower portions of the latter are made up chiefly of rounded fragments of the underlying porphyrites. All which clearly

shows that the red beds have been built out of the ruins of the older strata of the district. This is unquestionably the origin not only of the conglomerates, but of all the red beds through which the river Jed cuts its way from the base of the hills to the Teviot. When we trace out the boundary of these beds, we find that this leads us along the base of the hills, close to the hill-foot; and not only so, but it frequently takes us into the hill-valleys also. And this shows that the Cheviots had already been deeply excavated by streams before any portion of the red beds was deposited.

I have said that the red beds are approximately horizontal; sometimes, however, they have a decided *dip* or inclination, and when this is continuous, it is invariably in a direction away from the hills. Thus as we traverse the ground from the hill-foot to the Teviot, we pass over the outcrops of the red beds and slowly rise from a lower to a higher geological position. The strata, however, are generally so flat that their dip is often

not greater than the average slope or inclination of the ground. Hence when we ascend the valley-slopes from the stream, we soon reach the higher beds of the series, as, for example, in the undulating heights that overlook the Jed in the neighbourhood of Jedburgh. In that district a number of quarries have been opened, in which the upper beds of the red series are well exposed, as at Ferniehirst, Tudhope, &c. These consist of thick beds of greyish white, yellowish, and reddish sandstones, which, unlike the crumbling earthy deposits below, are quite suitable for building purposes. Scales of fish and plant remains are often met with in the thick sandstones, but the underlying, earthy, friable, red beds appear to be quite destitute of any organic remains.

Let us now briefly recapitulate the main facts we have just ascertained. They are these: 1. All the low grounds that abut upon the hills are composed of horizontal or nearly horizontal strata, which consist chiefly

of red earthy beds, passing down into conglomerates, and up into whitish and reddish sandstones. 2. The conglomeratic portion forms the boundary of the series, fringing the outskirts of the hills, and resting sometimes upon Silurian strata and sometimes upon Old Red Sandstone igneous rocks. 3. Fossils occur in the White and Red Sandstones, but seem to be wanting in the red earthy beds.

The accompanying diagram gives a generalised view of the relation borne by the red beds to the older rocks of the Cheviots. It will be seen that the former rest *unconformably* upon the Old Red Sandstone igneous rocks, and also, of course, upon the Silurian strata. The section shows that the red beds lie upon a worn and denuded surface. Now this speaks to the lapse of a long period of time. It may be remembered that we had some grounds for believing that the latest eruptions of the Cheviot volcanoes were sub-aërial. The evidence now enables us to advance further, and to state that after the

close of the volcanic period, the whole Cheviot district existed as an elevated tract of dry land, from which streams flowed north and south. And for so long a time did these conditions endure, that the rivulets and streams were enabled to scoop out many channels and broad valleys before any of the outlying red beds had come into existence. Before the conglomerate beds were laid down, the ancient volcanic bank of the Cheviots had thus suffered great erosion. This is what "unconformability" means. It points to the prolonged continuance of a land surface, subject as that must always be to the wearing action of the sub-aërial forces. Rain and frost disintegrate the rocks, and running water rolls the debris from higher to lower levels, and piles it up in the form of gravel, sand, and mud, in lakes and the sea. While the old volcanic country of the Cheviots was being thus denuded, it would appear that a wide extent of land existed in the Northern Highlands and Southern Uplands of Scotland, and also in what are now the lake districts of England and the hilly tracts of Wales. And in all these regions valleys were formed, which at a subsequent time were more or less filled up with newer deposits.

The presence of the red beds that sweep round the base of the Cheviot Hills shows unmistakably that a period of submergence followed these land conditions. All the low grounds of Southern Scotland disappeared beneath a wide sheet of water, which stretched from the foot of the Lammermuirs up to the base of the Cheviots, and here and there entered the valleys, and so extended into the hills. This water, however, does not seem to have been that of an open sea, rather was it portion of a great freshwater lake, brackish lagoon, or inland sea. The lowest beds of the red series are merely hardened layers and masses of gravel and rolled shingle, which would seem at first sight to indicate the former action of waves along a sea-beach. There are certain appearances, however, which lead to the belief that these ancient shingle beds have had quite another origin. In some places the stones exactly resemble in shape those peculiar blunted stones and boulders which are found so abundantly in what are termed glacial deposits, and which owe their origin to the grinding action of glaciers. Such glaciated stones are frequently covered with striae or scratches, which they received when, under the ice, they were rubbed against each other, or upon the rocky bed of the slowly

moving glacier. And some of the stones in these old conglomerates are marked in this way. But this is very rarely the case because most of the stones appear subsequently to have been rolled about in water, and in this process they would lose any ice-markings they may have had, and become smoothed and rounded like ordinary gravel stones. The same appearances may be noted in the glacier valleys of Norway and Switzerland, where at the present day the glaciated stones which are pushed out at the lower ends of the glaciers are rolled about in the streams, and soon lose all trace of their ice origin. It is impossible, however, to enter here into all the details of the evidence which induce me to conclude that glaciers existed at this early period among the Cheviot and Lammermuir Hills. In the latter district, the conglomerates occur in such masses and so exactly resemble the morainic debris and ice-rubbish of modern glacial regions, that Professor Ramsay long ago suggested their ice-origin.

Let us conceive, then, that when the ancient lake or inland sea of which I have spoken reached the base of the Cheviots, there were glaciers nestling in the valleys. Streams issuing from the lower ends of these would sweep great quantities of gravel down the valleys to the margin of the lake, and it is quite possible that there might be enough wave action to spread the gravel out along the shores. It is evident, however, that the main heaps of shingle would gather opposite what were at that time the mouths of glacier valleys; and it is just in such positions that we now meet with the thickest masses of conglomerate. Ere long, however, the glaciers would seem to have melted away, and only fine sand and mud, with here and there small rounded stones and grit, accumulated round the shores of the ancient lake. Of course, during all this time fine-grained sediment gathered over the deeper parts of the lake bottom.

We have no evidence to show what kind of creatures, if any, inhabited the land at this time; nor do any fossils occur in the red earthy beds, to throw light upon the conditions of life that may have obtained in the lake. So long as the glaciers sent down ice-cold water, however, the conditions would hardly be favourable to life of any kind; for glacial lakes are generally barren. But the absence of fossils may be due to other causes besides this. It is a remarkable fact, that red strata are, as a rule, unfossiliferous, and the few fossils which they do sometimes

yield are generally indicative rather of lacustrine and brackish-water, than marine conditions. The paucity or absence of organic remains seems to have been often due to the presence in the water of a superabundance of salts. Now this excessive salinity may have arisen in either of two ways. First, we may suppose some wide reach of the sea to have been cut off from communication with the open ocean by an elevation of a portion of its bed; and in this case we should have a lagoon of salt-water, which evaporation would tend to concentrate to such a degree, that by-and-by nothing would be able to live in its waters. Or, again, we may have a lake so poisoned by the influx of springs and streams, carrying various salts in solution, as to render it uninhabitable by life of any kind, either animal or vegetable. Many red sandstone deposits, as Professor Ramsay has pointed out, are evidently lagoon formations, which is proved by the presence of their associated beds of rock-salt, gypsum, and magnesian limestone. They have slowly accumulated in great inland seas, whose waters were subject to evaporation and concentration, although now and then they seem to have communicated more or less freely with the ocean. The red earthy beds of the Jed, however, although unfossiliferous, yet contain no trace of rock-salt or magnesian limestone. The only character they have in common with the salt-bearing strata of the New Red Sandstone of England is their colour, due to the presence of peroxide of iron, which we can hardly conceive could have been deposited in the mud of a sea communicating freely with the ocean. But a quiet lake fed by rivulets and streams that drained an old volcanic district, is precisely the kind of water-basin in which highly ferruginous mud and sand might be expected to accumulate. Such a lake tainted with the various salts, &c., carried into it by streams and springs (some of which may have been thermal; for, as we shall see presently, the volcanic forces, although quiescent, were yet not extinct), might well be unfitted for either animal or plant, and probably this is one reason, at least, why the red earthy beds of the Jed are so unfossiliferous.

After some time, the physical conditions in the regions under review experienced some further modification. Considerable depression of the land gradually supervened, and the waters of our inland sea or lake rose high on the slopes of the Cheviots. Mark now how the character of the sedi-

ment changes. The prevailing red colour has disappeared, and white, yellow, and pale greenish or grey sand begins to be poured over the bed of the lake. Even yet, however, ferruginous matter exists in sufficient quantity to tint the sediment red in some places. With the appearance of these lighter-coloured sandy deposits, the conditions seem to have become better fitted to sustain life. Fish of peculiar forms, which, like the gar-pike of North American lakes, were provided with a strong scaly armour of tough bone, began to abound, weeds grew in the water, and the neighbouring land supported a vegetation now very meagrely represented by the few remains of plants which have been preserved. In some places fish-scales are found in considerable abundance. They belong to several genera and species which are more or less characteristic of the Old Red Sandstone formation. The most remarkable form was the *Pterichthys*, or wing-finned fish. Its blunt-shaped head and the anterior portion of its body were sheathed in a solid case of bone, formed by the union of numerous bony scales or plates. Two curious curved spine-like arms occupied the place of pectoral fins, and may have been used by the creature in paddling along the bottom of the sea or lake in which it lived. The posterior part of the body was covered with bony scales, but these were not suturally united. Other kinds of fish were the *Holoptichius* and *Coccosteus*, both of which were, like the *Pterichthys*, furnished with bony scales. The scales of the former overlapped, and had a curious wrinkled surface. The head of the *Coccosteus* was protected by a large bony shield or buckler, and a similar bony armour covered the ventral region.

The organic remains of these fish-bearing strata are too scanty, however, to enable us to form any idea of the kind of climate which characterized the district at this long-past period; but if we rely upon the fossils which have been met with in strata of the same or approximately the same age elsewhere, we may be pretty sure that the climate was genial, and nourished on the land an abundant vegetation, consisting of ferns, great reeds, and club-mosses, which attained the dimensions of large trees, conifers, and other strange trees which have no living analogues.

It seems most likely that when the land sank down in the Cheviot district, so as to allow the old lake to reach as it were a higher level, some communication with the outlying ocean was effected. Red ferru-

ginous mud would then cease to accumulate, or gather only now and then; the deposits would, for the most part, be white or yellow, or pale green; and fish would be able to come in from the sea. The communication with the ocean, however, was probably never very free, but liable to frequent interruption.

Here, then, ends the third great period of time represented by the rocks of the Cheviot district. The first period, as we have seen, closed with the deposition of the Lower Silurian strata. Thereafter there supervened a vast lapse of time, not recorded in the Cheviots by the presence of any rocks, but represented in other regions by the enormous series of the Upper Silurian formations. During this unrecorded portion of past time, the Silurian strata of the Cheviots were hardened, compressed, folded, upheaved to the light of day, and worn into hills and valleys by the action of the subaerial forces. Then began the second period of rock-forming in our district. Volcanoes poured

out successive beds of molten matter and showers of stones and ashes, and so built up the rock-masses of the highest parts of the Cheviot Hills. All these eruptions belonged to the Old Red Sandstone age, and form a portion of what we term the Lower Old Red Sandstone. After the extinction of the volcanoes, another prolonged period elapsed, which is not accounted for in the Cheviots by the presence of any rocks. Then it was, as we know, that the great volcanic bank was denuded and worn into a system of hills and valleys. Now, since it is evident that the red beds of the Jed and other places are also of Old Red Sandstone age, it follows that they must belong to a higher place in the Old Red Sandstone formation than the highly denuded igneous rocks upon which they rest unconformably. The reasonable conclusion seems to be that the denudation or wearing away of the Lower Old Red Sandstone igneous rocks of the Cheviots was effected during that period which is represented in other districts of Scotland by what

Fig. 8. *s*, Silurian strata; *r*, Cheviot Igneous Rocks (Lower Old Red Sandstone); *u*, Upper Old Red Sandstone series; *c*, Kelso Igneous Rocks (Lower Carboniferous); *d*, Lower Carboniferous Sandstones, Shales, &c.

is called the Middle Old Red Sandstone, so that the Jed beds will thus rank as Upper Old Red Sandstone.

I come now to speak of certain rocks which, although they are developed chiefly beyond the limits of our district, yet require a little consideration before we can complete our account of the geological history of the Cheviots. The rocks referred to consist chiefly of old lava beds, which very closely resemble those of the Lower Old Red Sandstone. They appear on the south side of the Tweed valley below Kelso, whence they extend south-west and west, crossing the river at Makerstoun, and sweeping north to form the hills about Smailholm, Stichill, and Hume. All to the east of these rocks, the valley of the Tweed is occupied with a great thickness of grey sandstones, and grey and blue shales and clays, with which are associated thin cement-stone bands, and occasional coarse sandy limestones called cornstone. These strata rest upon the outskirts of the Kelso igneous rocks, and are clearly of later date than these, since in their lower beds, which are often conglomeratic, we find

numerous rounded fragments of the igneous rocks upon which the sandstones and shales abut. The latter have yielded a number of fossils, both animals and plants, to which I shall refer presently. In the bed of the Teviot near Roxburgh, and elsewhere, the Kelso igneous rocks are found reposing upon whitish and reddish sandstones, which are evidently the upper members of the red beds of the Jed Water and other localities.

Strata closely resembling the grey sandstones and shales of the Tweed valley appear among the Cheviot Hills at the head of the Jed Water, where they are marked by the presence of thick massive sandstones, which form all the tops of the hills between Hungry Law and the heights that overlook the sources of the Liddel Water—the greatest height reached being at Carter Fell, which is 1,815 feet above the sea level. The strata at this place contain some impure limestone and thin seams of coal. No old lava beds, however, like those of Kelso, underlie the series, which appears to rest directly upon the Upper Old Red Sandstone.

Now let us rapidly sum up what seem to

be the inferences suggested by these few briefly-stated facts. We have seen that the Upper Old Red Sandstone began to be deposited in a lake which, as time wore on, probably communicated with the sea, while the land was undergoing a process of depression, so that the area of deposition was thus widely increased, and sediment gradually accumulated in places and at levels which existed as dry land when the ancient lake first appeared in the Cheviot district. The old lava beds of Kelso show that the volcanic forces, which had long been quiescent, again became active. Great floods of molten matter issued from the bowels of the earth, and poured over the bottom of the inland sea. But all the larger volcanoes of this period were confined to the centre of the Tweed valley. Not a few little isolated vol-

Fig. 9. Showing present outline of the ground; δ, plug of igneous rock; α, Ejectamenta of angular stones, &c.

Fig. 10. Showing original outline of cone; the dark line from g to g indicate present surface of ground (as in Fig. 9); α, Ejectamenta; δ, plug of igneous rock, which rose in a molten state and cooled in the vent.

canoes, however, seem to have dotted the sea-bottom beyond the limits of the Kelso area. From these, showers of stones were ejected, and sometimes also they poured out molten matter. Their sites are now represented by rounded hills which stand up, more or less abruptly, above the level of the undulating tracts in which they occur. Among the most marked are Rubers Law, Black Law, the Dunian, and Lanton Hill. Of course it is only the plugged-up vents or necks that now remain; all the loose ejectamenta by which they must at one time have been surrounded have long since been worn and washed away. At last the Kelso volcanoes became extinct, and the little ones also probably died out at the same time. Another long period now ensued, during which the inland sea disappeared, and its dried-up bed was subjected to the denuding

action of the subaërial forces. The volcanic rocks of the Kelso district suffered considerable erosion, while the softer sandy strata amongst which they were erupted no doubt experienced still greater waste. Ere long, however, the scene again changes; and what is now the vale of the Tweed becomes a wide estuary, the shores of which are formed at first by the Kelso igneous rocks. Into this estuary rivers and streams carry the spoil of the Southern Uplands, and strew its bed with sand and mud. Occasionally ferns and large coniferous trees are floated down, and, getting waterlogged, sink to the bottom, where they become entombed in the slowly accumulating sediment. The character of these plants shows that the climate must have been genial. They belong to species which are characteristic of the Carboniferous formation, and we look upon them with interest as the forerunners of that vast plant-growth which by-and-by was to cover wide areas in Britain, and to give rise to our coal-seams, the source of so much national wealth. In the waters of the estuary, minute crustaceous creatures called *cyprides* abounded, and with these were associated a number of small shells, chiefly univalves. Here and there considerable quantities of calcareous mud and sand gathered on the bed of the estuary, and formed in time beds of cement-stone, and impure limestone or cornstone. How long this condition of things obtained in the Tweed valley we cannot tell; but we know that after a very considerable thickness of sediment had accumulated, estuarine conditions prevailed over the south-west end of what is now the Cheviot range. This points to a considerable depression of the land. The same climatic conditions, however, continued; and here and there, along what were either low islets or the flat muddy shores of the estuary, plants grew in sufficient quantity to form masses of vegetation which, subsequently buried under mud and sand, were compressed and mineralised, and so became coal. The only place where these are now met with is on the crest of the Cheviots at Carter Fell. The process of depression still continuing, thick sand gradually spread over the site of the submerged forests. To trace the physical history immediately after this, we must go out of the Cheviot district; and it may suffice if I merely state that these estuarine or lacustrine conditions which prevailed for a long time, not only over the Tweed and Cheviot areas, but in various other parts of Scotland, at last gave place to the sea. In this sea, corals, sea-lilies, and

numerous molluscs and fishes abounded—all pointing to the prevalence of genial climatic conditions. The geological position of the estuarine beds of the Tweed and the Cheviots—resting as they do upon the Upper Old Red Sandstone—and their organic remains, prove them to belong to the Lower series of the great Carboniferous formation.

It was some time during the Carboniferous period that great sheets of melted matter were forcibly intruded among the Lower Carboniferous strata of the Cheviot district; but although these are now visible at the surface, as at Carter Fell, they never actually reached that surface at the time of their eruption. They cooled in the crust of the

Fig. 11. *s*, Sandstones and shales intersected by mass of intrusive igneous rock *b*.

earth amongst the strata between which they were intruded, and have only been exposed to view by the action of the denuding forces which have worn away the sedimentary beds by which they were formerly covered.

A very wide blank now occurs in the geological history of the Cheviots. We have no trace of the many great formations, comprising vast series of strata and representing long eras of time, which we know, from the evidence supplied by other regions, followed after the deposition of the Lower Carboniferous strata. The Middle and Upper Carboniferous groups are totally wanting, so likewise is the Permian formation; and all the great series of "Secondary" formations, of which the major portion of England is composed, are equally absent. Nay, even the Tertiary formations are wanting. There is one very remarkable relic, however, of Tertiary times, and that is a long dyke or vertical wall of basalt rock which traverses the country from east to west, crossing the crest of the Cheviots near Brownhart Law, and striking west by north through Belling Hill, by the Rule Water at Hallrule Mill, on towards Hawick. This is one of a series of such dykes which are often common enough in some parts of Scotland, but which become

more numerous as we approach the west coast, where they are found associated with certain volcanic rocks of Middle Tertiary or Miocene age, in such a way as to lead to the belief that they all belong to the same period. The melted rock seems to have risen and cooled in great cracks or fissures, and seldom to have overflowed at the surface. Indeed it is highly probable that many or even most of the dykes never reached the surface at all, but have been exposed by subsequent denudation of the rocks that once overlaid them. Such would appear to have been the case with the great dyke of the Cheviot district.

We can only conjecture what was the condition of this part of southern Scotland in the long ages that elapsed between the termination of the Lower Carboniferous period and the close of the Tertiary ages. It is more than likely that it shared in some of the submergences that ensued during the deposition of the upper group of the Carboniferous formation; but after that it may have remained, for aught we can tell, in the condition of dry land all through those prolonged periods which are unrecorded in the rocks of the Cheviot Hills, but have left behind them such noteworthy remains in England and other countries. Of one thing we may be sure, that during a large part of these unrecorded ages the Cheviot district could not have been an area of deposition. Rather must it have existed for untold eras as dry land; and this explains and accounts for the enormous denudation which the whole country has experienced; for there can be little doubt that the Lower Carboniferous strata of Carter Fell were at one time continuous with the similar strata of the lower reaches of the Tweed valley. Yet hardly a trace of the missing beds remains in any part of the country between the ridge of the hills at the head of the Jed Water and the Tweed at Kelso. Only one little patch is found capping the high ground opposite Jedburgh at Hunthill. Thus more than a thousand feet of Lower Carboniferous strata, and probably not less than five hundred or six hundred feet of Old Red Sandstone rocks, have been slowly carried away, grain by grain, from the face of the Cheviot district since the close of the Lower Carboniferous period.

BISHOP WILSON OF CALCUTTA.

PART II.

THE incumbent of St. John's Chapel was mercifully spared; and he rose up from his sick bed, vicar of Islington.

The living was in the gift of his family, and on the death of the old vicar it passed naturally into the hands of Daniel Wilson. It was great preferment for him; but he loved his old flock, and he was grieved in spirit to be severed from those with whom he had so long "walked in the house of the Lord as friends." He now found himself called to associate with new men, and to face new conditions of ministerial life. The duty was of another kind, but it was scarcely less arduous, and certainly less pleasant. Here nothing had been done to clear the way for him. He had had no Cecil for his predecessor. And, in his feeble state of body, he was little able to overcome the obstructions which lay in his path. On the 2nd of July, 1824, entering then upon his forty-seventh year, he was inducted. He had been silent for eight months, and it was not without difficulty that he preached his first sermon to his new parishioners ("Feed the Church of God that is among you"). But it soon became manifest that his bodily infirmities would not suffer him to enter fully upon his work. He needed further relaxation, and, painful as was the necessity, he succumbed to it, or he might never have tended a flock again. So, having made all necessary arrangements, he turned his back upon the great metropolis, and sought a fresher air and a more quiet life in the country. He had not rested enough. It was his duty to cease from labour a little longer; and he wisely determined to be still and silent till November. If that interval had been one of hard work and continued personal anxiety, the new year would, in all human probability, have dawned on Daniel Wilson's grave. But by God's blessing, the peaceful life, which he led at Wooton, restored him; and he went to his new parish in better health than he had enjoyed for a long time. His first sermon unmistakably declared the course of action which he designed to follow. The text was from Mark i. 15, "The time is fulfilled, and the kingdom of God is at hand. Repent ye and believe the Gospel." I remember to have heard him, as Bishop of Calcutta, deliver a most impressive discourse to a military congregation, on the words, "If the trumpet give an uncertain sound, who shall

prepare himself to the battle?" The new vicar of Islington determined to give no uncertain sound. The trumpet note was shrill and clear. Men might not like the summons, but there was no misunderstanding it. It was a call to rouse men from the soundest sleep. The greater number of his parishioners had not been accustomed to it. So many were perplexed and alarmed.

But he was not minded to discourage or deter them. He would not hastily pour the new wine into the old bottles. Some of those who had listened to him admiringly in John Street, being residents in the great Islington parish, were disposed to think, and did not hesitate to say, that he had forsaken his principles. He had not forsaken his principles. The same gospel truths were uttered; but the utterances were pitched in another key. The style of preaching so favoured at the chapel would soon have preached the church empty. It was right that he should think of his parishioners, and subdue his fiery zeal for a time. He was confident that it would all come right in due season; and it did. Even the most inveterate of his opponents, at the commencement of his career, soon came to reverence and to love him. His parochial work contributed much to this result. He was so manifestly sincere, there was such kindness and suavity in his manner, such an interest discernible in all their worldly affairs, that it was impossible to resist him. But, for all this, there were elements of strife inseparable from the condition of affairs, which presented itself soon after his establishment in Islington. Though he increased the number of services at the parish church, it was obvious that there was a sore want of accommodation for a continually increasing population of worshippers. He was eager to build three new churches, or chapels-of-ease, and, in spite of much powerful opposition, he succeeded. In such a case, as was afterwards shown in India, there was an heroic constancy, or, as some said, a "dogged resolution," about the man, which overcame all opposition. All this was not accomplished without much perturbation of spirit; and there were other grieving thorns to pain him still nearer home. The health of his wife, always delicate, now (1827) failed her altogether. It was too plain that she was dying. On the 10th of May she "fell asleep." Still he

worked on, in deep depression of spirits, but not halting in his career. So years passed; the new churches were built; school-houses were rising. Daniel Wilson had set his mark upon the place; but it was not ordained that he should see the full effect of his work. A still greater work lay before him. He was offered the bishopric of Calcutta.

It was not a very tempting offer. Since the establishment of the Indian episcopate, less than twenty years before, four Protestant prelates had been struck down on the scene of their labours. About the same time there had been what was irreverently called "a rot among the judges." It seemed as though these untoward incidents established the fact that Europeans proceeding to India in middle-life were exposed to far greater risks than young men or striplings, with infinitely less to mitigate the severity of the climate and to ward off its assaults. The first bishop (Middleton) had stood up longest against the climate. During a period of eight years he had presided over the Anglo-Indian Church. Heber, James, and Turner had followed each other rapidly to the grave. When news of this last calamity reached England, there was great consternation as to the past and much perplexity as to the future. Who was to succeed Bishop Turner? Charles Grant, afterwards Lord Glenelg, was then President of the Board of Control, and with him rested primarily the nomination of a successor. That his sympathies in this conjuncture would turn towards the "Clapham sect" was not to be doubted. But the opinions of others were to be considered. And even the "Clapham sect" were divided. There was a little nervousness in high places about the appointment of an evangelical preacher to a post that demanded much more than evangelical preaching. The Indian episcopate had been inaugurated by the selection of a high, ritualistic Churchman; he had been followed by two men of high culture, a poet, and art-critic; and the fourth bishop had given good promise, but had not been permitted to develop in India any peculiar ecclesiastical tendencies. It was at least a moot point whether the Anglo-Indian Church could be better governed by a churchman nurtured in the atmosphere of John Street, Bedford Row, or one reared under the shadow of a cathedral. There was one man who, at that time, above all others, seemed eminently fitted to fill the gap and to represent the desired compromise. This was Dr. Dealtry, rector of Clapham. He was a scholar and a gentleman, and he had un-

questionably the making of a good bishop in him. But the more advanced of the "Clapham sect" were not satisfied with his evangelical teaching. There was an irreverent saying, on some parts of the Common, which I will not repeat, about his "nibbling at the gospel." He certainly had not the rapturous enthusiasm, the fervid utterance, the deep devotion of the Newtons and the Cecils. But he was essentially a safe man—not likely to offend others by the expression of extreme opinions, or by any eccentricities of conduct and demeanour. The episcopal appointment was not unwisely offered to him; but he could not be induced to accept it; he had no desire to leave his home and his flock. Thus circumstanced, Charles Grant had not far to go for a fitting substitute. Daniel Wilson might not be so safe a man as William Dealtry; but he was likely to tone down. He would surely temper his enthusiasm with a sounder discretion, when the burden of a larger authority and a heavier responsibility rested upon him. So the President of the Board of Control offered the bishopric of Calcutta to the vicar of Islington, and the offer was accepted.

And, on the 19th of June, 1832, Daniel Wilson, fifth Bishop of Calcutta, sailed for the seat of his diocese on board the *James Sibbald* Indiaman, taking his daughter with him. Simeon and other friends welcomed him on deck, and bade him an affectionate farewell. His fellow-passengers were of the usual, varied kind, and there was not much to edify him. But he tried to edify others. He instituted morning and evening prayers, and on Sundays he preached sermons, than which his biographer declares he never delivered any more admirable. But he was eager to reach the seat of his new work, and impatient under the necessary delay. He was delighted, therefore, when he reached the "half-way house," and disembarked himself at Cape Town. Of course there was work to be done—ground for new churches to be consecrated, meetings to be attended, sermons to be preached, a confirmation to be held. After the usual period of delay for taking in water, provisions, &c., the *James Sibbald* sailed out of Table Bay, carrying on a happier bishop than it had landed there. It happened that at this time Dr. Simon Nicolson, the well-known and much-beloved Calcutta physician, a man with the soundest of heads and the best of hearts, was recruiting his health at the Cape. The bishop, who had not been without grave doubts as to the effects of an Indian climate on his constitu-

tion, sought an interview with Nicolson, and asked the experienced physician to examine him, and to declare his opinion without reserve. Orally and manually the good doctor made his inquiries and experiments, and pronounced, without hesitation, that, humanly speaking, there was no reason why he should not live in the enjoyment of good health, for a quarter of a century, in India. This sent the bishop onward to his destination with new confidence—with heart and hope such as had not sustained him before. And the sequel proved that Simon Nicolson was right.*

On the 5th of November, 1832, Bishop Wilson landed at Calcutta, and in the absence of Lord William Bentinck, was received by Sir Charles Metcalfe and his Staff. He had the cold weather before him, and he was in excellent health and spirits throughout that delightful season. "Never," he wrote in January, "have I had such health for these ten years, as I have had since the pilot came on board the *James Sibbald*. . . . The suitability of the post to my habits, disposition, and practice of business; the delight I have in it; the importance of the opening prospects and apparent blessings overwhelm my mind." But, though he wrote thus cheerily, he had already discovered that there were difficulties surrounding the position of a bishop who had little or no authority over his clergy; for they were not under him, but under Government orders. On the 2nd of February, the Governor-General arrived, and at once called upon the bishop. They soon became, personally, fast friends. But there was an under-current of conflict very different from that which the reader of this sketch might anticipate. Transplanted from London to Calcutta, the some-time incumbent of the chapel in John Street became a stickler for the dignity of Establishments. Lord William Bentinck said that he cared nothing at all about Establishments, but a great deal about Christianity, and thought that the country might do without bishops. Daniel Wilson soon reconciled himself to this difference of opinion. "What is it," he wrote to Charles Grant, "compared to a difference which might easily occur about the good of India, the interests of the natives, and the diffusion of Christianity, on which we are strongly agreed?" Good news,

too, came from England. The Anglo-Indian Church Establishment was to be still further dignified by the appointment of suffragan bishops, and Daniel Wilson became, in due course, Metropolitan of India.

Still, on the other side, as time went on, vexations great and small multiplied upon him. Not only did the old trouble of disputed authority, both from above and from below, disquiet and dispirit him; but it seemed to him that although he received all possible kindness and courtesy from governors-general, there was little real Christian sympathy between them. They did not much frequent his church or listen to his discourses. On the 30th of January, 1842, after the terrible news of the insurrection at Caubul, and the murder of Sir William Macnaghten had reached Calcutta,† the bishop recorded in his journal, "I have been delivering a thanksgiving sermon on the dear Queen's safety, and also to sustain the broken hearts of our friends under the appalling news from Caubul. The Governor-General was present and the two ladies (Misses Eden). The Governor-General has never heard above two or three sermons from me; the last was July 9th, 1837." He had told the Bishop a few days before that he "thoroughly disliked his new Cathedral Establishment,"—of which mention will be presently made. It is not difficult to understand why that noble-minded Christian hero Lord Hardinge was, of all the governors-general with whom he was associated, the one whom he most admired and esteemed.

But that which afflicted him with the greatest sorrow was the state in which he found Bishop's College, the great ecclesiastical seminary on the opposite bank of the river. The trail of Bishop Middleton was over it all. It seemed to Daniel Wilson little more than a great hotbed of Romanism. "I have had a melancholy day at Bishop's College," he wrote in January, 1847. "I had not visited it for three years.† Nothing could exceed the personal kindness and respect of the principal and the professors. The buildings are in excellent order. My Visitor's Room was ready. The number of students greater than ever. But when I came to examine the youths in divinity, their ignorance was deplor-

* This is not told in Mr. Bateman's book, but I had the fact, in the following year (1833), from Dr. Nicolson himself, who told it to me, sitting on the poop of the *Protector*, by which vessel he was returning to Calcutta. I was then going out to India as a cadet. The *Protector* was afterwards lost at the Sandheads.

† The treachery and blood-thirstiness of the Afghans excited his strongest indignation. At a meeting held soon afterwards to promote some charitable objects connected with this great tragedy, or to vote an address to Lord Auckland on his departure, the Bishop, after discoursing on the wickedness of the enemy, exclaimed, "But our time will come—let us only get at them." I did not hear him say it, but I was in Calcutta, and it was much talked of at the time.

† He had been in England in the interim, of which more presently.

able. They seemed to have no love to Christ and their missionary work. The commonest questions puzzled them. I made an address and adverted to three matters that had been reported to me. Firstly, that two students had called on Dr. Carew, the Popish Archbishop, and one of them had kissed the ring on his finger, which is the common token of allegiance. Secondly, that another youth had declared that he was ready to go and join the Romanists. Thirdly, that the head mistress of the Military Orphan Asylum had professed herself a nun. We had a long talk afterwards with the principals and professors. It is quite clear to me that things have been going on for three years as I feared. I really came away, after seven or eight hours spent at the college, sick at heart." Nor was this tendency towards Romanism confined to the students of the college. Many manifestations of what was then known chiefly by the name of "Puseyism" were apparent among the chaplains of his diocese—some more lamentable than others. It could not but wound a man of his fine Christian temper to see so many of those who worked under him turning the simple faith of the Redeemer into a thing of shows and shams.

Into the details of Daniel Wilson's episcopal life I cannot enter in a brief sketch of this kind. That he was very zealous and very active, that he was always up and doing, and that whatsoever he did he did with all his might, need not be said, for he could not have done otherwise. For twelve years he laboured on unceasingly, and then he broke down. He could not work any longer without a season of total rest; so, early in the hot season of 1845, he proceeded to England by way of the Red Sea. It would have been wiser, perhaps, to have submitted once again to the old dreary passage round the Cape. But having an object in view—a visit to England—it was not in his nature not to endeavour to accomplish it with the utmost possible dispatch. The renovating effects of a long sea-voyage have often been visible in the ruddy cheeks and robust frames of passengers, who have left India in worse plight than the good Bishop. But when he arrived off the shores of England, he was "worn, pale, thin, the hollow eyes buried in the brows, the knees feeble, the nerves shaken, and the whole frame agitated." His recovery was slow. The jungle-fever clung to him, and at intervals asserted itself painfully. Little by little, however, the enemy withdrew from its stronghold. The good native air, and the pleasurable excitement

of meeting old friends, invigorated him. His reception was all that he could desire. Among other scenes of his youth, which he visited, was the old place in Cheapside. "Went to No. 31, Milk Street," he wrote in his journal, "where, in 1792, I was an apprentice. I visited the warehouse, counting-house, parlour, kitchen, bed-room, where I passed with my staff over Jordan, in my boyhood." Soon afterwards he preached in Lower Weston Church, and ascended the pulpit-stairs of Chobham. But he had much to do, of another kind, and as strength returned, he attended many meetings, some in aid of his episcopate, others of Christianity generally. There was in this furlough life much to interest him deeply, but there was pain, as there was pleasure, in the interest. Some whom he loved and honoured had gone before him; others, whose dawning splendours he had watched, had risen into full meridian fame; bishops and archbishops, scholars and statesmen, now did him honour. There was something kindly and genial in his manner which set off his undoubted earnestness and sincerity, so that men of widely different characters were attracted towards him in society. One eminent failure, however, is written down against him. He tried, when others had failed, to "draw out" William Wordsworth; but the great poet remained grim and reserved; the bishop could make nothing of him. In more important matters of public concernment he sometimes broke down, but in a different way. He was too simple himself to take rightly the measure of an English minister, especially in respect of his arts of evasion. He did his best, whilst in England, to carry out one of his pet projects—the establishment of an Agra bishopric. He never lost an opportunity of urging it upon the Government, in season or out of season; but he was always told that it would not do to give umbrage to the Court of Directors. It was not, however, on ministers and directors, but on the Church, the Universities, the Public, and to these may be added the Crown, that he relied for the furtherance of the great ambition of his life. This was the erection and consecration of the new cathedral on the great plain of Calcutta, which he had left behind him in a forward state, and which now, by every means in his power, he was promoting among his brethren in the country of his birth.

But, all this time, he was eager to return to the country of his adoption in the East. So, towards the end of the summer of 1846,

wisely eschewing the overland route, he took his passage on board the *Prince of Wales* passenger-ship, and, after a rapid and pleasant voyage, with "constantly improving health, no sea-sickness, no illness . . . no storms, no calms, no calamities, no quarrels, no parties among the passengers," he returned to his duties before the end of the year. He was then sixty-eight years of age; but what he looked forward to as the crowning work of his episcopal life lay still invitingly before him, and beckoned him back to the home of his choice. He had given largely to it from his own stores. He had collected largely both in India and in England, and the work of construction, under the superintendence of Colonel Forbes of the Engineers, had proceeded rapidly towards its close. There had been some vexatious opposition at the commencement; but he had lived it down. It was thought by some, that as there was a lack of church-accommodation all over India, the magnificent sum expended on one stately edifice at the capital might, in the interests of Christianity, be more advantageously devoted to the construction of a number of smaller places of worship. I confess that I held this opinion myself, and freely expressed it. But I have outlived the error. The bishop felt that nothing was so much needed in India as some outward and visible sign of the dignity of Christianity, discernible by the fleshly eyes of these followers of false creeds, who at least testified their reverence for the Almighty by the magnificence of the altars erected to Him. Our failure in this was a reproach to the true faith, and Bishop Wilson determined to remove it. How he devoted to this great end nearly all his worldly wealth is too well known for me to dwell upon it. The bishop never faltered in his good work. The first stone of the new cathedral had been laid on the 8th of October, 1839. At the beginning of the cold season of 1848 it was consecrated with all befitting solemnity. Wilson was then in his seventieth year, and he felt that his work was done.

But he lived and toiled yet for ten more years, and died an octogenarian on the 2nd of January, 1858. It was at least a natural wish, and one which few will condemn, even though all may not sympathize with it, that he should have desired to lay his bones beneath the roof of the noble structure which must ever be associated with his name. So he still remained at his post. But it was a time of weary waiting. Mr. Bateman tells us that the frailty of the flesh was often

painful to witness, but that his intellectual energy was wonderful to the last. His journals show no indication of mental failure, and we are told that he was a greater reader than ever. His constitutional powers of endurance must have been wonderful. In the very last year of his life he was prostrated by a terrible accident. He was knocked down by a "jill-mill," or wooden shutter, in his verandah, and lifted up with a broken thigh; but his unflinching resignation and cheerfulness carried him through it, though his medical attendant little thought that he would survive. He often could not sleep, but he could always pray, and his thankfulness was unbounded.

It is not easy to describe with much exactness what it was that made Bishop Wilson, alike in the pulpit and in society, so different from other men. It is something rather to be felt than to be told. His biographer repudiates the epithet "eccentric." Perhaps a negative, rather than a positive, adjective will best describe the prominent features of his character. It was in an extreme degree *unconventional*. His preaching and his behaviour were, at least, strange. There may have been a few men in India who had heard Cecil and Rowland Hill discourse in their earnest impassioned way, pouring forth great gospel truths with a grotesqueness of illustration that awed their hearers whilst it amused them. But these exceptions are so few that it may be broadly said that nothing like Wilson's preaching had been heard by an Indian audience. One thing is certain, he never put his hearers to sleep. It was impossible not to listen to him. The familiarity of illustration, in which he indulged so freely, excited even the most apathetic. Some irreverently said that one of the bishop's sermons was "as good as a play." And there was truly something almost theatrical in his manner. He did not merely declaim. He acted his sermons. And he always adapted them to his congregation. I have an especial remembrance of one sermon, which he preached at a great military station near Calcutta. It was in the hot season, and there had been a great spread of fever in the place. The bishop preached on the goodness of God in visiting his people with afflictions of all kinds, and often piling up one misery upon another until the sufferer was fain to ask "My God, my God, why hast thou forsaken me?" But God was the great Physician of our souls. He knew what He was doing. "Now you ought to understand this. You have

and he took an especial interest in those who recently had been, or were about to be, married. It was the custom in Calcutta, in those days, for the friends of a bride or bridegroom to entertain them a few weeks after the event; and the Bishop, to whom many letters of introduction were brought, especially from his friends about Islington and Clapham, seldom neglected an opportunity of paying this courtesy to a young married couple. It was not his speciality to think much of sparing the blushes of men or women, old or young, and it was his wont to take the bride on his arm and to introduce her to all the ladies present, with an intimation that she was just married, and often with some remarks about her family. On one occasion, when the banquet was spread and the guests assembled, the bride and bridegroom did not present themselves. The bishop waited a quarter of an hour, then a second, and a third quarter; but the guests of the evening did not appear. So it was concluded that some accident had happened, and the order was given for an advance to the dining-room. Next morning the unconscious bridegroom met some friends, who asked him what he had been doing on the evening before. He answered that he had dined at home with his wife. "But you were expected at the Bishop's. We waited nearly an hour for you." "Waited for us! That is good! Why we were not even asked." Off went the young officer to the palace in a state of inconceivable astonishment. An inquiry was made. The letter-book was sent for, and then it appeared that there were two subalterns, brothers, in the same regiment, one posted at Dumdum, near Calcutta, and the other serving on the furthestmost confines of Afghanistan. The invitation to dinner had been addressed and despatched to Caubul. It had never occurred to any one at the palace to ask if the invitation had been answered. "Never mind," said the good-natured bishop; "you shall have another dinner—only Lent will be here next week;

so you must wait till it is over. Meanwhile you shall join my family party."

These little family dinners were very pleasant—only two or three friends and the Bishop's chaplain, after his daughter's marriage, being present. After coffee, he had family prayers in his study. They were real prayers, fresh, original, warm from the heart; not mere repetitions of printed forms of speech. He almost invariably addressed some parts of them to the special circumstances of his visitors. With prayer he often mingled exhortation, when his hearers were young people, as they often were. He would tell a young officer to set a good example to his men, or if he were associated with native troops, to show them the way Christians ought to live. There was something strange and unaccustomed in this personality at first, but the good words were not wholly thrown away. There were apparent in it manifestations of paternal interest, most sincerely felt as they were, that greatly endeared the good bishop to his friends, though there were not wanting some who spoke of the questionable "taste" of these displays. But Daniel Wilson did not pride himself upon his taste. In truth he did not much like the word. Taste and tact are excellent things in the ordinary commerce of life; but they are no part of the stock-in-trade of an apostle. Bishop Wilson in pure simplicity of mind and artlessness of demeanour was a Dr. Primrose in lawn sleeves. But the outward singularities which made men smile, will be forgotten, long before the high-toned Christianity of the man, and the good it wrought in India, cease to be honoured traditions. In the written lives of those whom he most honoured in the spirit and loved in the flesh are saintly records of just men made perfect—but I know not one among them, who, in pure and simple piety and faith, more nearly approached the true Christian standard than Daniel Wilson, Fifth Bishop of Calcutta.

JOHN W. KAYE.

THE PARABLE OF THE SOWER.

By THE LATE BISHOP THIRLWALL, D.D.

"When much people were gathered together, and were come to him out of every city, he spake by a parable: A sower went out to sow his seed."—LUKE viii. 4.

FOR a heart touched with any measure of true, earnest love to God and man, there can hardly be a more solemn or more moving spectacle on earth than that which

meets the eye of the preacher, as he looks down on a crowded congregation assembled in the house of God, to hear from him of things which concern their highest interests

in time and eternity. Surely that is a sight which should quench every selfish feeling, in a deep sense of an awful responsibility and a brotherly sympathy, when he considers the greatness of the object set before him, the preciousness of the opportunity, the inadequacy of the utmost efforts he can exert to satisfy the demands of such an occasion. If there was room for any thought of self, it should only be for the reflection that the things of which he is to speak concern himself at least as much as any of his hearers. So that the larger the assembly gathered round him, the more it should not only quicken his zeal, but deepen his humility. And yet the effect is sometimes the reverse of this: to feed a vain and miserable self-complacency, with the consciousness of being the centre of attraction to so vast a concourse, the one person on whom so many eyes are fixed, so many minds intent. This is one of the temptations which has ever beset the ministry of the gospel, and especially in those who have been most richly gifted for the work. They value the position which they occupy for its own sake. They delight in the power which they possess of drawing attentive listeners to their feet, independently of the means by which it is gained, or the end which it is to serve. How would a preacher of such a character have exulted in such a proof of his popularity as is described in the text! How gratifying to his self-love, that not only much people should be gathered together to hear him, but that for the sake of this they should have left the cities where they dwelt, and have put themselves to the trouble of a long journey! That would be an occasion on which he would not fail to bring out the choicest of his intellectual treasures, and to exhibit all the graces of his eloquence.

You all feel, my brethren, that to imagine such a state of mind in our blessed Lord, would be the greatest dishonour we could offer Him; that if, for a single moment, he had ever harboured such a feeling, it would destroy all our confidence in Him, and would bring Him down to the level of our sinful humanity—to one, indeed, lower than that which, through his grace, many of his own servants have attained. The whole passage shows how far otherwise the case was with Him. He was used to such gatherings; but there seems to have been in this something remarkable, something which He deemed worthy of special notice. It is possible that He observed in some of his audience indications of a spirit adverse to a

right reception of his teaching. At all events, the lesson with which He opens his lips is in the nature of an indirect rebuke; for it is a warning which would not have been needed, if all had been as it ought to have been with them. And though He afterwards explained the general purport of the parable to his disciples, it can hardly be supposed that it was entirely hidden from the multitude, or that they did not perceive that it was meant to be applied to themselves. And then they would be forced to gather from it this wholesome, but humbling and mortifying truth—that they had come, some of them from afar, at great cost of time and trouble, without having duly considered what it was they expected to find; or, still worse, that they were professing to seek from Him that which He, indeed, was willing to give, but which they were not prepared to receive. And the general tenor of the parable would lead them to conclude that this was the case, not with a few among them, but with the majority; that it was not the exception, but the rule. For the work of the sower is represented as attended by failure oftener than by success. The lesson is urged upon the multitude with the exhortation, "He that hath ears to hear, let him hear," implying that many who had never doubted of their power of hearing, were afflicted with unconscious deafness. It is expounded to the disciples, because it concerned them not only as hearers, but as preachers and teachers. It is, indeed, one which deserves to be studied at all times, and never more than in our own day. I am not going to enter on a full explanation of the parable, but only to note some points in its bearing.

The most important act in the whole process of tillage is unquestionably the committing of the seed to the ground. All the other labours of the field relate to it, and depend upon it. Without it, none of them would have any use or meaning. The sowing of that seed which is the Word of God occupies a no less high place in the course of spiritual husbandry. And here Christ himself is the Sower; and that which He sows is his seed; all others who have ever sowed like seed have taken it out of his granary. It is the purest and best of its kind, and is endued with the highest possible measure of virtue and fruitfulness. And the difference between Christ himself and any of his faithful ministers, in this matter, does not consist in the nature or substance of the Word which they dispense. If their harvest is less abundant, it is not because the seed is

of an inferior quality. He, indeed, spake as never man spake. For He spake as one having authority, from his own knowledge of the things which He revealed, and not as the scribes, from traditions handed down to them by others. And his ministers can speak only as scribes instructed by Him in the things belonging to the kingdom of heaven. But the things themselves are essentially the same, and vary only in the form in which they are adapted to the different wants and capacities of mankind. If it were otherwise, the best of all sermons would be the simple reading of one of Christ's discourses.

Again you will observe that the seed sown in the different soils was all of the same kind. That which bare fruit a hundred fold was no better than that which withered away as soon as it was sprung up. And in our Lord's explanation of his parable, there are various classes of hearers, differing as widely as possible from one another, but all alike hearers, and all hearers of the same word; and then, when we consider the immense difference in the final result, though the preciousness of the gospel-seed may not be lessened to our view, we shall find ourselves forced to admit that its power and efficacy fall short of that which we often see ascribed to it, and apparently with full sanction of Scripture itself. Mark the images by which Jeremiah illustrates its irresistible might. "Is not my word like as a fire? saith the Lord, and like a hammer that breaketh the rock in pieces?" How ill do these images appear to correspond to the history of the seed. That which fell upon the rock did not break it in pieces, did not gain a lodging within it, did not make the slightest impression upon it, but lay powerless on the surface, until it withered and perished. And that which fell among the thorns did not put forth the energy of fire to consume them, but was itself choked by them as it sprang up, and left them in uncontested possession of the field. How are we to reconcile such signs of weakness with the language of the Epistle to the Hebrews? "The Word of God is quick and powerful, and sharper than any two-edged sword." And yet how often is it actually wielded in vain, and lights upon souls cased in an armour which it cannot pierce, on which it leaves not even the faintest print!

It is very important for every minister of the gospel, that he should bear these facts in mind, that he should look them calmly in the face; that he should not flatter himself

with expectations which, being opposed to the witness of experience, must issue in disappointment. It would be sinful ingratitude to speak or think lightly of the ordinance of preaching, hitherto the most powerful of all instruments in the establishment and extension of the Redeemer's kingdom. But it is a mischievous delusion to fancy that the preaching of the gospel is all-sufficient. It is related of an eminent German Reformer, that he used to say, "When I first began to preach, I imagined that nothing could withstand the force of the Word. But before long I found out that old Adam was too much for young Melancthon." That was a wholesome though mortifying lesson. But the confidence with which he set out was not groundless, though it needed to be moderated and qualified by a larger view of the means of grace, as well as probably to be cleared from all mixture of youthful presumption and self-reliance.

Scripture itself supplies the necessary corrective of such an exaggerated estimate of the efficacy of preaching, and explains the conditions of success and the causes of failure. The greatest of preachers, the Apostle of the Gentiles, was fully aware that the weapon which in his hands had proved so "mighty to the pulling down of strongholds," was such, not in itself, still less by reason of the strength and skill with which he wielded it, but "through God"—"mighty through God;" not only, as God's workmanship, but as adapted by Him to the particular occasion in which it was employed by his minister. Otherwise St. Paul well knew that, notwithstanding all his zeal and self-devotion, it could not have prospered. And so he does not scruple to speak of the "foolishness of preaching," as designed, by its wonderful effects, to bring out in clearer light the power and wisdom of God, working so mightily with so weak an instrument. And having shown by the examples of Jews and Greeks, that the same preaching was to them that perished foolishness, and to them who were saved the power of God, he proceeds to lay bare the root of the matter, and to assign the true cause of this diversity: "The natural man receiveth not the things of the Spirit of God: for they are foolishness unto him." There it is. As long as this bar stands in the way, preaching will be of no more avail than songs to the deaf, or pictures to the blind. The inner, spiritual senses, through which alone it can be profitably received, is wanting. And so, my brethren, there is danger for those who are entering on the work of the ministry, not only

lest they should fall into that snare of which I was speaking at the outset; making the exercise of their office an occasion of self-pleasing in self-display, and therefore preferring that kind of exercise which affords the chief opportunity of self-display. It is not such as these only, who have indeed mistaken their calling, and are abusing sacred things to serve their selfish ends, who are in danger. There is likewise danger for those who dedicate themselves to their work with the purest intentions, and the most earnest desire to do faithful and loving service to God and man, lest they should mistake a part for the whole, and should concentrate all their energies in a simple function of their office which they, perhaps rightly, deem the highest, but which will itself suffer, if others be neglected for its sake. "The natural man receiveth not the things of the Spirit of God." But we know that he may become capable of receiving them; and then the preparation, by which the natural inability is repaired, or the obstacle which prevents the reception is removed, is in every such case more important than the direct communication of the things themselves. But what preparation is this, and by what agency is it to be wrought? Doubtless, in its ultimate origin, it is the work of the Holy Spirit. If the Word of God is quick and powerful, it is so because it is "the sword of the Spirit." If so great things were accomplished by St. Paul through the foolishness of preaching, it was because it was accompanied by "the demonstration of the Spirit," which endured it with irresistible power. But the question is not now as to the origin, but as to the means and channels of grace. And so we are reminded that the ministers and stewards of Christ's mysteries are dispensers, not only of the Word, but of the Sacraments; and if the power of the Word is too exclusively maintained by some, there are others by whom the dignity of the Sacraments is exalted far above it, so as to leave it only a subordinate and almost precarious position. And this is no longer a question by which the unreformed Church is distinguished from the Churches of the Reformation, but one which divides our own branch of the Church into two antagonist parties or schools. But it is one on which we have no need to dwell for the present, because, notwithstanding the exaggerations to which schools and parties are prone, especially in times of warm controversy, in the statement of their distinctive views, it is admitted by all, on the one hand, that both

the Word and the Sacraments are divinely appointed means of salvation, and on the other hand that the Sacraments do not act indiscriminately on all who receive the outward symbols of the grace which they convey, any more than does the Word on all who hear with their outward ears. There is still need of preparation for a profitable reception of either. And so we are forced back upon the question, What preparation is this? and what is the agency to which we must look for it? And it is not a sufficient answer to say, It is the agency of the Holy Spirit, unless we were sure that it is one which He has reserved to himself, and in which man is not allowed to co-operate, so that all that can be done by the most faithful and earnest minister of Christ, is to implore the blessing of the Holy Spirit on his administration of the Word and Sacraments; which is indeed no more than every one does, either by the express order of the churches, or in conformity to pious usage. And I do not say that such a prayer, if it is not a mere conventional movement of the lips, but an inward fervent breathing of the heart, would not suffice, so far as man is concerned; for it would then express a disposition, which would show itself alike in every function of the pastoral duty, and would impart the highest energy to the whole.

Preachers cannot preach without hearing; and therefore they must, in their own persons, exemplify and represent one or other of the classes of hearers described in the parable. If in them the gospel seed finds no more genial soil than the beaten track of a world lying in wickedness; if in them the impressions made by the Word are so shallow and fleeting, that they disappear under the slightest pressure of temptation; if in them whatever desires it awakens after heavenly things, are seen to be speedily stifled by earthly cares or pleasures; if such is the effect upon themselves, how can they look for any more successful working of their ministry in others? It is they who have themselves received the word in an honest and good heart, who keep it as the dearest treasure of their own souls, who are themselves ever ripening in faith and holiness—these it is who may go out into the gospel field, with a hope, which shall not be disappointed, that they shall reap in due season; who, when they are ready to faint, may solace themselves with the assurance, that the Lord of the harvest smiles upon their labours, and will, in his own good time, reward them with the joy of his rest.

THE STREAMLET.

BEAUTIFUL stream,
 Cheery and bright,
 Wild as a dream,
 And welcome as light.
 Down from the hill,
 Through the green bowers ;
 Swift-running rill,
 Watering the flowers.

Curving about,
 Zig-zag or straight,
 Now in and now out,
 Early or late.
 Still sweeping on,
 Beautiful stream ;
 In calm monotone,
 Love for thy theme.

Hidden some-while,
 Covered with flowers ;
 Then for a mile
 Swelled with sweet showers.
 Leaping along,
 Always at speed,
 Rippling in song
 Through pasture and mead.

BENJAMIN GOUGH.

THE POSITIVE EVIDENCE FOR CHRISTIANITY.*

THE attitude of objectors to Christianity has changed very much of late years, and is likely to change more and more. Formerly it was not thought that the question was one between this religion and any other. The intrinsic superiority of the Christian religion was freely admitted, and no one thought of setting forth the claims of Mahamedanism, or of Buddhism in opposition to those of Christianity. Now it is otherwise. Owing to the wider acquaintance with the languages and religions of mankind, we have learnt, not, indeed, absolutely to espouse the cause of these religions as against Christianity, or to adopt them as our own, but to regard them as so many developments of the religious instincts of humanity, among all of which Christianity itself may perhaps be the highest and the best. The consequence, therefore, is that the other religions of the world have risen in the estimation of mankind, while the estimate of Christianity has declined. Christianity and the other religions of the world have approximated more nearly to each other. The absolute superiority of the former is not now admitted, a relative superiority only is allowed. The notion of any one of the religions of the world being true, and the others false is repudiated. Christianity itself is only regarded as being possibly nearer the truth, or as containing a larger amount of truth. Now this kind of deferential treatment of his religion is simply intolerable to the Christian. To every believer Christianity, when it ceases to be regarded as true, is degraded into being the worst form of lies, because a form which is least open to detection. To him Christianity is not simply supreme among the religions of the world, but the only religion that can *now* claim divine sanction. The significance of this word now is very great, as we shall hereafter see, and the fact that it can be used appropriately, is part of the actual evidence for Christianity.

It must, or course, be conceded that a faultlessly logical proof that the religion which we profess is true cannot be presented; but neither can a faultlessly logical proof that it is *not*.

Putting the most extreme case we can imagine, viz., that God should proclaim by a voice from heaven that this religion was

true, such a statement would still be liable to be rejected by all but those who heard it, and those who should accept their testimony; and it seems possible that among those who heard it, there might be some or even many who would persist in doubting the evidence of their senses. Now the positive evidence for the truth of Christianity is obviously less than this, and consequently we cannot expect its reception to be very different, certainly not to be more favourable.

But then is probable evidence to be rejected when we can get no other, and when, as in this case, it can be shown to be highly probable that no other is to be expected?

The being of a God is a fact that is incapable of proof; but notwithstanding this, it is a fact that the majority of thinking men are ready to accept, whether Christians or not. If, therefore, the being of a God is a fact that is incapable of proof, is it at all probable that the truth of a religion supposed to be sanctioned by Him would be more capable of demonstration than His own existence? If we cannot be absolutely sure that He exists, how can we expect to be absolutely sure that a religion, though coming from Him, is true? Indeed, we cannot be sure on this latter point, unless we first assume the existence of a God; but assumptions are excluded by demonstrative proof. Unless, therefore, we can prove to demonstration the existence of a God, it is no valid objection to the evidence for Christianity, that it is only probable, and not demonstrative. On the contrary, given the existence of a God, and it is highly probable that the evidence for a religion coming from Him would be of the same character as the evidence for His existence, that is to say, not demonstrative.

It is, however, essential to the nature of probable evidence, that it admits of probabilities on the other side, and appeals, therefore, to our critical faculty, to our powers of discrimination, and of estimating the comparative weight of proof.

The case, therefore, for Christianity must be one of the balance of probabilities, which accordingly must vary according to the individual who has to deal with them. When our opponents affirm that they reject Christianity, because its truth is not proved, they tell us nothing new. But it must not be forgotten that no man can reject, or ever did reject Christianity, because there is *no* proof,

* A Lecture delivered at Kensington, at the request of the Christian Evidence Society, May 11th, 1875.

that is to say no *evidence* for it. We may hesitate to allow that the evidence is sufficient, we cannot assert that it is *nil*. To say so is only to manifest our ignorance of the most important question we have undertaken to decide upon. How, then, does the case stand with regard to Christianity? What do we mean when we use the term Christianity? Christianity is a religion of which the central and essential feature is belief in a person who claimed, and as believers say justly claimed, to be the Christ. What is the meaning of this latter term must be considered later. But take away the Christ from Christianity, and the thing as well as the name comes to an end. Now the broad outstanding features of the history of Christianity are sufficiently obvious, and do not admit of any doubt. Christianity has existed in the world for some eighteen hundred years. We know for certain that it did not exist nineteen hundred years ago, at that time there was not a trace of it to be found in the world. What have been its fortunes during this time is tolerably well known to every one. It has gone on steadily increasing in the area of its reception and influence from century to century. Its progress in this respect during the last fifty years has been very remarkable, and may perhaps favourably compare with that of any period of its growth. The essential faith, moreover, of the people called Christians is virtually stereotyped. The faith of Catholic and Protestant Christendom is to a certain point identical, and the Christian belief of this age is practically the same with that of any previous age that can be named. Many things were believed during mediæval times, which were discarded at the Reformation; but the Reformation did not add any new fact to the creed of Christians, it disabused the Christian mind in many cases of a multitude of doctrines, but it did not add any single fact to the Christian creed. In short the Reformation may be described as a violent reaction issuing in the return to that form of belief which was prevalent in the earliest ages of the church, so that the faith of men was remodelled on what was believed to be the primitive and original pattern, and so it has essentially continued ever since. The desire has constantly been to get as near as possible to the pure and primitive ideal; if in any case this has been missed, the result has been ostensibly undesigned.

But this primitive ideal is only to be obtained from the earliest existing Christian literature. It is absolutely certain that no

Christian work of any kind existed nineteen centuries ago, nor any trace of the Christian society. But it is also absolutely certain that several Christian works were in existence eighteen hundred and fifteen years ago. These were some of the letters of St. Paul. Those, *e.g.*, to Thessalonica, Rome, and Corinth. The genuineness of these letters, certainly the three last, is not to be disputed; in fact, they are all commonly acknowledged to be genuine, and may be so regarded. Allowing, therefore, that Christian literature and Christian society had begun to exist by the year 60, and that neither had any existence fifty years before, it is obvious that the rise of the Christian society must have taken place within that period. There is no truth more certain in history than this, that we must search for the first origin of the Christian religion and the Christian society between the year 10 and the year 60. But then the Epistles of St. Paul that we have afford conclusive proof on many points, first, as to the wide-spread existence of the Christian society at the time they were written, and for its existence several years before; and, secondly, as to the nature and constitution of that society and the character of its belief. The fact of letters being written to believers so far apart as Rome, Corinth, and Galatia, proves the existence of believers in those places; while the letters themselves show that there was a bond of union between the various churches, and that their system of belief was identical. There is also incidental evidence in the letters that the Christian society had been some years in attaining to its present magnitude. It must also be borne in mind that no authority is claimed for these writings more than for those of Cicero or Tacitus. We merely take them as genuine documents, written by the man whose name they bear, and being authentic so far as relates to the various facts they incidentally imply, such, for example, as those already mentioned. But it is clearly shown by these letters that the sum and substance of the Christian belief was the life, death, and resurrection of a man called Jesus, who was regarded as the Christ and the Son of God. Of course, if this belief rested on a solid foundation of trustworthy evidence, it would go a very long way towards showing the truth of Christianity; but we must not assume this, nor do we venture to do so. All that we affirm is, that the Epistles of St. Paul afford positive and conclusive evidence as to the nature of the belief of the very earliest people called

Christians, of whom we have undoubted knowledge. And we find, moreover, that this belief is identical with that which is still held and has ever been held by all branches of the Christian Church, and may be briefly summed up as belief that Jesus of Nazareth lived, and died, and rose again, and that He was the Christ. On two of these points there is no room for doubt, viz., the life and death of Jesus of Nazareth. On the other two, namely, that He rose from the dead, and was the Christ, we must suspend our judgment, only we must remember that on these points the early Christians were unanimous, as the Christian Church has been from first to last.

With regard, however, to the life and death of Jesus, this fact is abundantly clear, that He died by crucifixion. Independently of the allusion in Tacitus to this fact, we may say for certain that it would have been impossible that it should have been believed as it was by the early Christians, and testified as it is in St. Paul's writings, if Jesus had died in any other way. On the supposition that Jesus did not die upon the cross, the preaching of the cross by Paul becomes a moral impossibility. We have got then, for certain, two facts—the historic existence of the man called Jesus, and his death by crucifixion. Either of these it is simply impossible to call in question. But very frequently the knowledge of certain facts is conclusive proof of others, of which we may not have direct evidence; and thus the fact that the cross of Christ was the staple of St. Paul's preaching is conclusive proof of the moral character of Jesus, and that if He died by crucifixion, being a righteous man, his death can only be accounted for in connection with his claim to be the Christ, which is the cause assigned for it in the Gospels. For instance, if we suppose the disciples of Jesus to have advanced this claim in his behalf, the fact that He died by crucifixion, being a righteous man, is a proof that He must himself have acquiesced in the advancement of the claim, for otherwise His dying such a death is inconceivable. His death on the cross may be alleged as conclusive proof that He claimed to be the Christ, and from other circumstances we may assume that the chief reason for His crucifixion was the fact that He had made this claim. It is manifestly impossible that St. Paul, being a convert from Judaism, and originally a bitter opponent of Jesus Christ, should have spent his life as he did in proclaiming the death of Christ and salvation through the cross, if the personal character of Jesus had not been

such as to bear the weight of the superstructure based upon it. St. Paul must have had means of knowing what manner of man Christ was, and if He had been other than a righteous man he could not have preached salvation through His name. If, therefore, the death of Christ was in any degree traceable to His character, that is to say, if He died for His transgression of the moral law, we should certainly not have had the phenomenon of Saul's conversion from a bitter persecutor to a zealous believer.

The death on the cross, therefore, comes before us as a fact which we can only account for on the supposition that Jesus was a morally good man, and that He had exasperated the Jews by his claim to be the Christ. The Romans, however, would not have put Him to death unless He had in some way infringed their law, and the Jews can only have put Him to death for claiming to be the Christ. It is morally certain, therefore, that He did not shrink from death in His determination to stand by this claim. He might have purchased his life had He been willing to forego it. His death, therefore, so far as He was concerned, was the seal of his claim. He staked his life upon it, and died to establish it.

We arrive at this conclusion, not from the evidence of the Gospel history, but by a series of legitimate inferences, drawn from certain known facts and circumstances; but the conclusion is one in complete accordance with the Gospel history. If, therefore, Jesus was content to be crucified in support of his claim to be the Christ, we shall have to reconcile that death and His known, or at least presumable, moral character with the fact that this claim was falsely advanced, if such is indeed the fact. But one only of these positions can be true, (1) Jesus knew Himself to be the Christ, and was the Christ, and died to attest it; or, (2) Jesus thought Himself to be the Christ, but was not the Christ, though He died to attest it; or, (3) Jesus knew He was not the Christ, but died to make men think He was. This last position is obviously untenable on the face of it, and absolutely inconsistent with His known character as it is with common sense. We are shut up, therefore, to one of the other two, and the second is that with which alone we have to do. Jesus, being a righteous man, died for the belief that He was the Christ, which belief, however, was a mere delusion on His part.

The first inference, therefore, is, that if Jesus was not the Christ, some one else must be.

We need not trouble ourselves with this dilemma, for we are not now arguing with those who believe in a Christ yet to come, and no one believes that Christ is come if Jesus was not the Christ. Consequently, we are thrown back upon this position, that Jesus was a righteous man, that He died on the cross, that He died on the cross because He claimed to be the Christ—a claim which He believed He was justified in making. We must proceed, then, to deal with this claim. What was the meaning of it? We must bear in mind that it was not only a personal, but a substantive claim. In claiming to be the Christ, He advanced a claim which excluded all other men, and He also laid claim to fulfil an office which is more or less likely to have been real according as He manifestly stood alone in fulfilling it. If it can be shown that He was right in advancing the claim exclusively for Himself, it becomes so far probable that the claim was not fictitious in the form in which it was advanced. But this is the allegation made against it in the present day. It is assumed that Jesus accommodated Himself to the notions of the time, and availed Himself of the prejudices of his age in claiming to be the Christ. Still we cannot get rid of the fact that the claim was made, and that He died to substantiate it; and the certainty of this fact does not depend upon the statements made in the Gospels, but is abundantly proved both by the existence of the Christian Church and the very name of Christianity, and by the phenomena of the undoubted Epistles of St. Paul. In these last we see that the very essence and centre of the earliest belief in the Churches of Rome, Corinth, and Galatia was the doctrine that Jesus was the Christ. Now this belief was combined with the knowledge that Jesus had been crucified, and with the belief that He had risen from the dead. There was no one in all these Churches who did not know that Jesus had been crucified. There was no one who did not believe that He was the Christ. What, then, do we mean by his being the Christ? We mean that the net result of the Old Testament Scriptures had been to impress mankind, or at all events the Jewish nation, with a conviction that a kingly Redeemer would arise from the family of David. It was the belief of the Jewish nation that the writings of the prophets were full of the conception of this great person. It is of no consequence whether or not the belief was well-founded; it is perfectly certain that the belief existed, and was very deeply implanted and very widely spread. Had this not been

the case, the existence of the Pauline Epistles would have been impossible. People would not have believed in Jesus as the Christ, and Jesus never would have been called the Christ. So that this also is a fact of which we may be absolutely certain, that the effect of the knowledge of the Old Testament Scriptures was to produce in men the belief in a Christ to come. The previous anticipations about such a person must have been necessarily vague, and very probably inconsistent; but that he was to be a great king, ruling with power and glory, and triumphing over the enemies of the nation, was the idea that would most fitly commend itself under the low political condition in which the nation then was. We need not appeal to the statements of the Gospels in support of this fact; it is one which would necessarily arise out of the circumstances of the time, and the many well-known declarations of the prophets. No one, therefore, who would claim to be the Christ could expect to have any chance of succeeding unless he bore some manifest resemblance to this ideal. But the fact which is at once remarkable and undeniable is that the character of Jesus, as depicted in the Gospels, bears no manifest or obvious resemblance to the kind of person whom the anticipations of the prophets had led the people to expect. That they expected some one is an indubitable fact; that Jesus was not the sort of person they expected is likewise indubitable; so that it was said with truth of Him, "He came unto his own, and His own received Him not." Whatever likeness there may have been between Jesus and the Christ of prophecy, it is certainly not the kind of likeness that the Evangelists would have been able or likely to invent, or that would have insured success to any one who, claiming to fulfil the prophets, desired to commend himself as the promised Messiah. Then over against this certain fact we have to set the equally certain truth that one principal element in the preaching by which belief in Jesus was produced and propagated was His death upon the cross, which was calculated to be, as St. Paul tells us it was, to the Jews a stumbling-block and to the Greeks foolishness; and yet, notwithstanding all this, which is historically certain and unquestionable, Jesus was received by multitudes, both Jews and Greeks, as Christ the power of God and the wisdom of God.

Let us then review our present position. We have in our hands, in the early literature of the Church, positive evidence of the way in which Christ's gospel was received by men

of different races and nations ; of the extent to which it prevailed, and of the rapidity with which it spread ; of the nature of the gospel which was proclaimed, and of the general effects produced by it. This may be characterized as a remarkable and entirely unexpected product of the Old Testament Scriptures. As a mere matter of literature, it is very remarkable that the book we call the New Testament should have been the lineal offshoot of the book we call the Old. It was the natural descendant, but supernaturally produced. No man, taking the Old Testament for his model or pattern, could have produced a single book of the New Testament ; and yet it is no less certainly true that but for the Old Testament not a single book of the New Testament could have been written. We are compelled to say that the result, as it stands before us, was not of man, neither by man. We are compelled likewise to say that but for the historic existence of Jesus Christ, the existence of any one book of the New Testament would have been a manifest impossibility. Neither are the Epistles the natural product of the Gospels, or even of the Gospel history. Nor are the Gospels the natural product of the Epistles ; and yet, on the other hand, had it not been for the facts of the Gospel history the Epistles would have been impossible productions. These are facts, then, which cannot naturally be accounted for, and which have no natural parallel. And they carry us thus far and no farther ; namely, that the kind of corroboration afforded by the New Testament to the Old, and the kind of fulfilment the Old finds in the New, are such phenomena as afford probable evidence of a very strong character that they were both designed. We cannot prove to demonstration that the meaning of the Old Testament is revealed in the New, but it is certain that the New Testament gives a meaning to the Old which it had not before, and it is impossible to acknowledge this as its meaning and not acknowledge it to be divine. If this is its meaning, it is the only meaning that God can have intended it to have, for otherwise it has no meaning at all, and it is a meaning which God alone could have discovered or designed.

But then we may go further and say that not only is all this undeniably true, but also that there is in the early known facts of Christianity very much which affords probable evidence, the only evidence we can have, of the existence of the supernatural at work in them. It is absolutely certain that the

effects produced by the preaching of Jesus as the Christ could not have been produced if there had not been another element in that preaching besides the fact of His death upon the cross. To suppose that an in glorious life terminated by a shameful death could have availed to work in a large body of men the conviction that the subject of them was the Christ, is simply absurd. This does not exhaust the actual causes that must have been at work. And as a matter of fact, we know that there was another potent cause. The resurrection of Jesus Christ was openly proclaimed. The resurrection of Jesus Christ was universally believed in the Christian community at Rome, Corinth, Thessalonica, and elsewhere. I do not say that this proves the resurrection was a fact, by no means. I only say that there is no possible doubt that the resurrection was an integral and prominent element in the faith of the first Christians, and of this the earliest Christian literature is a proof. Now it is to be remarked that we often hear it stated that there is no satisfactory evidence for the resurrection ; that the narratives in the several Gospels are contradictory and irreconcilable ; that we cannot be sure that we have in any case the testimony of an eye-witness, and the like. This is a very imperfect and incorrect representation of the actual state of the matter. If the authority of the Gospels is accepted, it is quite possible to show, as Gilbert West and others have shown, that the narratives are not contradictory, and that their testimony is most remarkable and very distinct ; but I do not dwell upon this, and do not now assume the authenticity of the Gospels complete as I believe it to be. If it is known that certain facts take place which involve the occurrence of certain other facts, then these latter, as I have said, may be considered to be proved even in the absence of direct evidence in their favour. But this is entirely overlooked by those who disparage the Gospel evidence for the resurrection. What we have to account for is the universal Christian belief that Jesus was the Christ. No one could have believed that such a person as Jesus of Nazareth is known to have been was the Christ without believing that He rose from the dead. There was, so to say, no evidence for His being the Christ at the first, when faith in Him began to spread, but the presumed fact that He rose from the dead. There was no shadow or show of His apparently being the Christ of prophecy apart from His resurrec-

tion. When He was believed to have risen from the dead, then it was seen that all the circumstances of His life were transfigured and glorified, and then it was seen that He corresponded with the Christ of prophecy in a novel and unexpected way. And in order to estimate the true value of this as a fact, let us imagine the case of any one else of whom similar incidents might be related. Many persons under the Roman government in Judea, no doubt, suffered death by crucifixion. Of no one of these was it ever affirmed, or could it for a moment be alleged, that he was the Messiah. The mere fact of such a death would have been sufficient to stigmatize him. So that mere crucifixion alone would not have produced in any other instance the likeness there is, or at any rate was imagined to exist, between Jesus and the prophetic ideal, let alone the fact that resurrection in their cases was never dreamt of. But then, again, on the evidence of the Gospels, it would seem that other persons besides Jesus Christ were known to have risen from the dead. Why was the claim to be the Christ never advanced in their case on the ground of their having risen again from the dead, except because it was felt that resurrection alone was not enough to establish the claim? It was the combination in one and the same person of many features which met in Him, and in Him alone. Any one of these features alone was insufficient to have suggested the others either to Himself or to His disciples. The resurrection could not have suggested the crucifixion, but was incomplete without it. The crucifixion could not have suggested the resurrection, but was incomplete and powerless without it. And yet the crucifixion is the most indubitable fact of all, and the very basis of the resurrection, though it was the one fact which for the moment appeared to shatter every trace of likeness in Jesus to the Christ of prophecy. But even the crucifixion and the story of the resurrection alone would have been insufficient to produce the conviction that Jesus was the Christ, unless behind both there was the backbone of the life and teaching of Jesus. We are told that though the disciples were slow to believe in the resurrection of their Master, His enemies had not only anticipated but actually taken means to prevent what they feared might give rise to the story. If this was so, then we must assume that Jesus had openly spoken of His rising again, or if He had not done so, we must assume that this story was invented by the Evange-

list to give additional credibility to the already fabricated but incredible story of the resurrection. But in point of fact the assertion of Christ that He would rise again did not make the resurrection antecedently more credible until it had occurred. And after its occurrence, supposing it to have occurred, it did not make it more credible, but only gave additional point and meaning to its occurrence. The mere fact, then, that Jesus Christ was declared to have been crucified and to have risen again is proof that there must have been something very remarkable in His life and death, or else the mere story of them could not have arisen, or having arisen would have been powerless to accomplish what was accomplished. So then we have for certain a very remarkable and notorious life, and an equally notorious death by crucifixion. And we have also a reputed resurrection. And out of these there came the rapidly growing conviction that Jesus was the Christ, that is to say, that there was so much correspondence between written prophecy and the known and alleged facts of Christ's history as to create a moral certainty that this correspondence was not, and could not be, fortuitous. Two positions, then, are possible, first, that the correspondence is imaginary, second, that the alleged facts were manipulated in order to create the appearance of it. Each of these destroys the other. If the correspondence is imaginary, there was no need for any manipulation of the facts. If the facts were manipulated, then the correspondence, such as it is, is real and not imaginary, or else there would have been further manipulation of the facts to make the correspondence yet greater than it is. But it is certain that the correspondence as it is could not have been invented out of the prophets, for the point in which it is greatest is the undoubted historic fact of the death upon the cross. Given this fact and the writings of the prophets, and the one as the actual fulfilment of the other, and the resurrection becomes, not a probability, but a certainty, and our only conclusion can be, "Thus it is written, and thus it behoved Christ to suffer and to rise from the dead the third day." After the fact, everything becomes clear; before the fact, everything is too dark to originate the fact.

And then, further, we must take into account one of the most obvious facts of history, that the preaching of the resurrection became the sole apparent cause of the most marvellous religious revival on record. And

not only so, but in all ages of the Church down to our own days, it is this same preaching of the fact of the resurrection, or, which is the same thing, of life though the name of Christ, which has been and is the certain cause of a like revival. When I believe in Christ, I rise from the dead, and I know that I am risen. I know that I cannot believe in Christ without thus rising. If one fact is a witness to another fact of which we cannot have, properly speaking, direct evidence, then is the known fact of life through the name of Christ, of which the whole bulk of early Christian literature and the existence of the Christian Church is a standing witness, a conclusive proof that Christ is risen. Taken by itself, this might indeed be insufficient and unsatisfactory, seeing that there is a tendency in human nature to move in masses; but, taken in connection with known facts of history, and with the written record of the prophets, it cannot justly be so regarded. The existence and history of the Christian Church is a phenomenon to which there may be some partial but no exact analogy in the history of the world. Had we discovered the Old Testament in the fifth century of the Christian era, the existence of the Christian Church would have been accounted for, having previously been utterly intelligible. But then we know that it existed in the fifth century before Christ, and we know also that but for its existence the Christian Church would not have existed. But that the Christian Church was not in any sense the natural offshoot of the Jewish nation, or the natural product of the Old Testament, is proved by the fact of that nation, who are the natural guardians of the Old Testament, having for eighteen centuries maintained an attitude of inveterate enmity to the Christian Church. The sacred writings of the Jewish nation testify distinctly against that nation, and they testify as distinctly in favour of Christ. If it is said, however, that this is a matter of the interpretation of Scripture, and therefore a matter of theology or exegesis, I reply emphatically that it is not. It is simply a matter of history and of fact. We know that a Christ was anticipated. We know that he was unlike our Christ. We know that our Christ was crucified. We know that He was reported and very widely believed to have risen again from the dead. We know that it was the belief in His having been crucified and having risen again that generated the conviction that He was the Christ, and we know that the growth of this conviction was continuous and continuous with the growth of the Christian

Church. This is all matter of undeniable history, and capable of demonstrative proof. It was the result of a series of facts, set over against and working on a series of writings and a national belief. It was the result of the apparent interpretation which history had supplied to a collection of ancient writings. The interpretation may have been wrong, the writings may have been worthless, but that the Christian Church, and with it the existence of our present Christian faith, was the result of the one and the other, is a fact as certain as the existence of the sun in the heavens. But then we may go one step further, and say that the existence of the national belief which was the indispensable basis of the Christian Church, without which the Christian Church could not have been reared, is itself all but a conclusive proof of a supernatural and divine element in the ancient Scriptures. Rightly or wrongly, as a matter of fact, these Scriptures gave rise to a current national belief which was deeply rooted. If the belief was an irrational and unfounded one, it yet has to be accounted for, as a matter of fact, and that it was not devoid of apparent foundation we can see for ourselves. The proof is as obvious now as it was two thousand years ago, and it never will be either less or more. However we may estimate the value of this foundation, there it is, and what was its result we know. The fact is also certain that in all the literature of the world there is no similar fact strictly analogous to be produced. The known anticipation of a Christ is a fact as unique, as the Scriptures of the Old Testament are themselves unique. It is impossible, therefore, to say that there is not evidence probable, nay, of the very highest probability, that the actual result produced was not only the natural, but the legitimate result of the ancient Scriptures; but if so, these Scriptures must have been inspired, they must have contained prophecies, and prophecies of such a kind and on such a scale, that it is not only improbable, but impossible, that the correspondence on a similar scale of historic facts therewith should have been fortuitous and undesigned. If there is any probability of the existence of a God, and any probability that He has spoken by the long result of history, then the broad and patent correspondence between the known facts of the Old Testament and the known facts of the New points to a conclusion which is not only highly probable, but is little less than absolutely certain.

STANLEY LEATHES.

WHAT SHE CAME THROUGH.

BY THE AUTHOR OF "LADY BELL," ETC.

CHAPTER XV.—LONG DICK FINDS A MATE.

THE aggrieved and potent rival soon heard of the incredible story. To Long Dick's apprehension an incredible story it sounded at first that the odd

day's-man whom they had taken on at the Manor farm, the flippant stranger mechanic of whom nothing was known, save by his own not altogether satisfactory account, was audaciously making up to Pleasance Hatton, the finest young woman, by a very long chalk, in the place. Joel Wray was making up to Pleasance Hatton with her superior birth and early breeding, and her heiress-ship, and Pleasance of all women who had on the whole been so shy of Long Dick's lowly worship and modest advances, was listening to this wandering young scamp, as if she were prepared to throw herself away on him. It was as hard as it was cruel to believe.

Long Dick was filled with trouble and wrath, not the least unbearable element in which was that he had raised a stick to break his own head. He it was who had on his own responsibility engaged the stranger to assist in the last day's wheat-hoeing. Long Dick it was who had recommended the bailiff to hire Joel Wray again for the harvest; the result of the hiring being that the bailiff was so pleased with the exertions of the new hand, raw as he was, that he proposed to keep him on for the rest of the autumn to aid in the potatoe gathering, the fence repairing and the draining, and to do a bit

of carpenter's work, as Dick himself did a bit of smith's work, on the farm, when not otherwise engaged.

This would have been bad enough had Joel Wray, who was also what Dick called a "fine scholard" in reading, writing, and ciphering, compared to Dick, managed to outstrip Dick in the bailiff's, and it might be in the end, in Lawyer Lockwood's good graces.

In the meantime the probable supplanter, for reasons of his own, held back from coming in contact either with the bailiff or the squire. When he had to be paid, or when he happened to attract the notice of the higher powers, even though it were their approving notice as of a smart, handy chap, his gift of talking and his self-assertion deserted him entirely, and he would hold down his head, be silent, and get out of the way as fast as he could.

But it was well-nigh unbearable that this forward adventurer should enter the lists where Long Dick, though he had made small progress, had till then run alone, outstrip his late patron, in the race, and carry off the great prize of life for Long Dick.

Long Dick could command some redress for the grievous injury with which he was threatened. All that was wanted was a word from him to the bailiff in disparagement of Joel Wray, an insinuation that he might not be the little that he represented himself, but "some polished rogue and thief," "a rascal who had given his last master leg bail," who was in hiding from the police, and who might end by setting the ricks on fire, or breaking into the bailiff's desk and running off with the contents.

But Long Dick, swelling with wrong and resentment as he was, shrank from such reprisals. All that was manly in the big fellow recoiled from the baseness of the retaliation, for it would be baseness, not caution, seeing that Long Dick, an honest man himself, had an innate conviction of the honesty of the vagabond. He might be a careless, thriftless vagabond, a restless rolling stone, a fickle Jack-of-all-trades, on whom it would be certain hardship and probable destitution with all its misery for Pleasance to bestow herself and her little fortune; but Long Dick believed in his heart of hearts that Joel Wray was as honest as himself, that he was free from

vice, and was in some respects as innocent in his smack of boyishness as Pleasance was in her womanhood.

Long Dick was fortified in his manliness by the conclusion which was somehow beaten and burnt in upon his slow intellect, that if he, Long Dick, were so left to himself as to do Joel Wray a shabby turn by getting him found fault with, and dismissed from his temporary place, and if it ever came to Pleasance's knowledge—and she was, among her other distinguishing qualities, what Long Dick called a very "knowin'" woman—she would pay him back in kind by never forgiving him.

No, Long Dick preferred to take his chance in a fair fight with his antagonist, bitter as the sense of rivalry was, especially with a rival so unworthy of him, and doubly tinworthy of Pleasance.

In those autumn days Long Dick had little rest or peace, save when he had recourse of an evening to his cousin Lizzie, and poured into her ears all that he could bring himself to express of his pain and fury. He was soothed by her endless sympathy, her incredulity as to Pleasance, "being so blind and mad," little reckoning all the time with what life blood of her own Lizzie was feeding his hunger and thirst for consolation and hope.

For a wonder, in those days of trial, Long Dick did not fall into his old excesses, in addition to Lizzie's urgent representation he was aware from his own intelligence that the crisis was too imminent, he dreaded too much an invidious comparison, for Joel Wray had not swallowed more than his glass of beer since he had first appeared at the Brown Cow. He was sober, this wandering mechanic, whatever other evils he had learnt in his wandering.

Long Dick shook off all his comrades save his faithful slave and cousin Lizzie at this time, above all he turned grimly from Joel Wray, who showed, on the other hand, a perverse inclination to make up to the head man of the farm, and even to stand some roughness from him, if he could but win him to be friendly at last.

Joel was very friendly himself, pleasant as well as fluent of speech to old and young, and looked, in general, as unconscious of giving any individual offence as when he had disappointed the giddier girls of Saxford by being bent upon his task of wheat-hoeing, and failing so much as to see their attempts to attract his attention and draw him into a rustic flirtation.

Joel, in spite of this ungallant overlook, in spite of his having only amended his first fault by the cool confidence which had caused him to bestow his regard on "Madam," who had a lover already, the best in the place, was a favourite with the women. He was liked by old and young, from Mrs. Morse and Phillis Plum, to whom he gave no trouble, down to Phillis's grand-daughter, little Polly, for whom he cut puppet dolls out of the pith of the elder—by all except Lizzie Blennerhasset; she saw him through her cousin Dick's eyes, and thought him a trifling, insignificant, yet blustering chap, a lad who was not worth a woman's looking at. Yet Dick was juster in his judgment, and knew to his torment that Joel Wray, though no giant like himself, had more than a man's spirit, was straight as an oak sapling, lithe as a willow wand, a proper young fellow who might very well steal a girl's heart, though such a girl's heart as Pleasance Hatton's was seldom found.

Joel had become so popular in the place that he gave back to Pleasance some of her popularity, repeatedly reduced and impaired as it had been by her wearing spectacles, by her coming into a fortune, and, last and greatest liberty of all, by her not having stopped short with conquering Long Dick, the old hero of Saxford, but extending the conquest to its new hero, Joel Wray. Joel was so great a favourite himself that his favour cast a halo of cancelled debt, and reflected glory round Pleasance.

But Joel was not satisfied with the women's homage, nor with the sneaking admiration of young Ned, the good-will of old Miles Plum, or even of such magnates as smith Blennerhasset or host Morse, whom Joel propitiated by discussing with them London news. He would make up to Long Dick, though Joel was continually getting over the knuckles, in a figure, for his assurance, and was shown with rude plainness that Long Dick scouted his companionship. Either Joel was very impervious to broad hints, very indiscreet—or he had been accustomed to have his own way and to be spoilt, as he had once said—or he had that craving for general good fellowship which with some men is a passion—or he had conceived a vehement, one-sided liking for Long Dick, for he would not be repulsed, would not keep himself at a safe distance, but returned again and again to the vain charge. He made Long Dick's life more miserable than it would otherwise have been, by introducing into it a strong temptation to punch Joel Wray's head, or fight him in some fashion,

while Joel Wray was a champion unworthy of Dick's superior prowess, and further, was under the protection of Pleasance's friendship, however wayward and indiscriminating, so that Dick had to resist the inclination as best he might.

Long Dick had ridden round one evening, on a plough horse, to see the cattle in an out-lying field, and was returning by Saxford Broad, cumbered and heavy with all those troubles. He was not aware that he was calmed by the repose of the evening, which was somewhat cloudy and lowering like Dick's state of mind, or by the peaceful stillness of the Broad, with its birds gone to rest. It presented a great sheet of rippled, slate-coloured water, unbroken at this moment by any barge, and with the profound quiet of its character increased, as it appeared, by the perfect flatness of its indented shores, which offered rush-bordered, ferny meadows, and a little wood, but not a height or bank. Calmed or not, Dick, according to custom, walked the horse into the shallow water, deepening as he went, to wash the animal's fetlocks, and to relieve them of the gathered dried mire of the day.

He had done the same thing every time he had passed the Broad, even when driving a wain with a couple of horses, on a hundred occasions, and he had no more dreamt of danger than he would have feared to go about his morning's yoking, or to lie down in his bed at night. But whether Dick's mind had got dazed with his cares, and he had departed from the usual approach of horses to the Broad, or whether some unapprehended change had taken place in the ground, all at once the horse he rode, a steady old horse as Dick knew it, plunged one fore foot into a hole of several inches depth, and with a wild struggle and splash, fell head foremost into the water, before Dick could slide from its back. He kept his seat, and was not sensible of injury, but by the cold rush of water round them, he became aware that it was deep enough to drown both horse and man unless the horse could regain its footing, or Dick could disentangle himself, and use his power of swimming which he had learnt in his sailor's trip from Cheam, to reach by a few strokes the near shore. But in the surprise of the momentary accident he had been guilty of an oversight, which was likely to be fatal to both horse and man—he had let the bridle be dragged from his grasp, and it was now caught in the terrified horse's feet, so that the capacity to aid it in its frantic efforts to rise

was lost, while at the same time the weight of the animal, and its convulsive efforts to get up rendered it a matter of the utmost difficulty and danger for him, even unhurt as yet, save by a bruise or two, to free himself from what would otherwise be a certain death.

It took but a few seconds for the incident, together with the despairing sense on Long Dick's part, that he was unable of his own ability to extricate himself, that every violent strain he made was exhausting even his boasted strength, that every stroke the horse gave threatened to disable or to kill him on the instant, that there was no help at hand, and the night was closing in. The consciousness that his act of washing the horse's feet had been so ordinary an act, and that the shore and safety were absolutely near, seemed only to render his impending fate harder and more bitter, without its being able to nerve him to hold out a moment longer.

People say that a drowning man's past life flashes before him, in its entirety, in a second of time. Perhaps Dick was too constitutionally and intellectually sluggish for such a marvel to be accomplished in his case. He was but dimly aware as consciousness was fast deserting him, and as his attempts to shake himself loose became as fitful and intermittent as the horse's rolling and kicking, that he wondered whether Pleasance Hatton would be sorry, and then that he was sorry for himself, in his own extremity, and for poor little Lizzie Blennerhasset's broken heart, before he said "Lord Jesus, help me," and in the same breath, heard faintly like a voice in a dream or in another world, a cry from the farther side of that end of the Broad.

Long Dick knew nothing farther—not of the figure that rushed into the water, and began to swim with the speed and directness of a practised swimmer—not of the mingled daring and caution with which the swimmer approached the eddying circles formed round the prostrate man and horse, still struggling and emerging at intervals—not of the grasp on his shoulder, and the shout into his failing ears which yet he mechanically obeyed, to try once again, as the horse swerved to a side—not when he was relieved from the horrible burden that had been weighing him down, and was dragged, happily only a few yards, and landed on the shore.

When Long Dick came to himself he was lying high and dry among the rushes, his head on the knee of a man, who was striving by an impromptu adaptation of all the theo-

ries which he had ever heard for the recovery of drowning men, to bring Dick back to himself. With the first conscious glance Dick recognised his detested rival, Joel Wray.

"There, old fellow, you're coming round," said Joel, cheerily, almost affectionately, redoubling his amateur medical offices. "What a mercy I turned out before supper, and walked as far as the Broad, to have a look at the ducks and plover which were all gone to roost hours ago! But it is an ill wind which blows nobody good. I knew you were not such a fine lady as to be finished off by a mouthful of cold water, such as I have shipped myself not only in little Cherwell, but in old Father Thames, more than once or twice either. I wish it were the thing for working men to carry a flask, I am sure they need it, as much as your sportsman or foxhunter. If I had had mine—one of my own I mean—I could have put a drop of brandy into your mouth, and brought you alive again in no time. Look here, you ain't kicked by that unfortunate beast?"

Dick was grumbling as soon as he was able to speak that he was not an "old fellow"—he was only growing four-and-twenty—any more than a fine lady, and he did not want brandy to cure him of a ducking, and where was the horse? With that Dick sat up in his dripping clothes, and peered through the dusk at the leaden-looking Broad, on which there was now neither bubble nor circle.

Joel Wray in an equally dripping condition as to raiment, sat up by Dick's side and looked with commiseration into his face.

"Don't take on about it, old—young fellow, it could not be helped. I could not save both of you, and the man came before the beast, not that men are always better than beasts either. Any way I could not have given the horse a leg up, it would be sheer brag to pretend it. He is done for, poor horse, lying quietly enough now, at the bottom of the hole you both managed to get into, at this edge of the Broad. Be thankful that you are out of it. All the same, I know you must be cut up for the dumb animal that you've worked with for years, I dare say, and that you have come to know like a brother, I have some notion of what the loss is, and I can feel for it."

Dick stared stupidly at the water, he was moist enough already, his tawny hair was dropping at every point still, but more moisture gathered in his blue eyes, and when he spoke it was with a lump in his throat that half choked him, and which he had to gulp

down before he could make his quivering voice audible.

"I druv and guided him from the first day I came to the Manor, three years gone; he were as tractable as a child, and never needed aught, save a word; Pleasance were used to ride him from the field, and he knew her and whinnied when she came near his stall. Her will cry her eyes out to-night. He were up in years for a hoss, and had served his day; he were not that much worth in hoss flesh, let alone Lawyer Lockwood, he d' know haccidents will 'appen, and will not count it out of my caracker; but for all that, I'd liefer all my savin's and my next year's wages were cast into that water, if so be owd Punch 'ould rise out on it, standin', stampin his feet, archin' his neek, and nickerin' for his feed as he were wont to do at this hour, like a Chrissen."

"Yes, yes, I know," said Joel, quite tenderly, "it ain't the loss of the tin, for that might be made up, it's the thought of the creature that worked for, and trusted us, and came to grief through our shortsightedness, that is the sting. But get up, and come along with me, else the night will be down, and we'll catch our death of cold."

"You are a discernin' chap, Joel Wray," said Long Dick slowly, as the two rose after they had fraternised over the destruction of the horse. "If you had hammered up on poor Punch bein' old, and well-nigh fit for the kennel, as some folks despise them faithful old hosses, wool, I 'ould still owe you my life at the risk of your own, for you were an ugly venture, with the poor beast as were so sensible, a-flinging out with terror like mad, with the torter on chokin, never to obey a word or sign more. But now I can bring myself to thank you hearty, though, mind, I say I 'a borne a big grudge again you these ten days back, and I 'on't say that I 'a no cause, on'y I ain't such a heartless brute nudder, as not to be grateful for life—more'n that the lad as has felt with me for Punch is a good un, odd man, or stuck mechanic on the tramp, as he may be."

"Bosh! any fellow would have done it," said Joel Wray, but colouring with bashfulness, that was decidedly becoming in one that was usually so confident, and with pleasure. "You would have done the same and more for me, or any man. There ain't any merit in it; we cannot help it; we should be worse than our dogs if we didn't obey an instinct of rushing to the rescue. But I say, Dick, I like you, you know I have liked you from the first, and I want a mate like you

to stand by and teach me many things that I have set my heart on learning. If I—if we are opposed on some things, on which we can't help being opposed, because they may get to be more than life and death to us—can't we make up our minds to differ on one or two subjects and to agree on the rest? Can't we be friendly foes in the middle of our strife, or even get to like each other? because I am sure you have the making of a gentleman in you—the root out of which all true gentleness has risen—I mean you are an honest, brave man, whatever your blunders and shortcomings. And for that matter, we are all in a precious mess together in this blessed country—which we persist in saying is so exceptionally free and prosperous—in addition to misunderstanding, and misjudging, and coming down like thunder on each other. And if one or two of us seek to get behind the scenes to learn a thing or two of our common humanity, to use, God willing, in the end, for the good of all, as the greatest enterprise with which the times provide us, why we are held to be fools or worse, that is the justice we are treated to!”

Long Dick stared blankly at this tirade. In the beginning of the speech Joel Wray's voice had been curiously persuasive, while in the end it had passed into the dogmatic, dogged, indignant tones of a man who is riding a hobby, and riding it to death, not altogether unconsciously; withal there was that monotony stealing into the accents which attends upon the habitual dreamer, who, if he does not commit the ancient vagary of soliloquizing, is still in the habit of holding, mentally, long conversations with himself, in which he is the sole speaker, or if he ever argues with himself only raises phantom objections in order to lay them, ghost-fashion, again.

Long Dick had never heard anything like this lecture in private life before. He made up his mind that Joel Wray must have taken, amongst his other trades, to “Methody” preaching, at one time, though he was a churchman now; or must have abode for a season with such a troop of strolling players as Dick had seen at Cheam, and at the neighbouring fairs. As an acquirement derived from either walk of life, he had learnt to “spout,” in addition to his ordinary long tongue, which was wont to wag like a girl's, and was treating Dick to the performance, it might be, as a distraction or solace after his recent misfortune and agitation.

Dick did not like it, did not feel so propitiated by the cleverness of the exhibition

as by Joel's simple words of sympathy for the horse's fate; in fact, it grated disagreeably on sturdy, stolid Dick's principles, as something out of place and insincere, something like laughing at his forced, painful admission and concession. It required the vivid, restraining sense of the benefit just conferred to prevent Long Dick feeling aggrieved, if not insulted, by the folly.

After a moment, Joel Wray seemed himself affronted at his own, hare-brained application of and improvement of the occasion on the country road, through the gathering darkness. He strode along in silence, with a certain air of discomfiture and discontent in his gait. When he spoke again it was to repeat briefly and wistfully the entreaty that Long Dick would let Joel be his mate, and would bear with him and his ignorance, cockiness, shallowness, light-heartedness, whatever it was; that he would, when they were forced to be foes, help Joel in the task he had set himself that they should be fair foes, and do each other no greater wrong than what they could not hinder, and must remember with regret in their greatest gain. “For do you know, Dick, I cannot tell what our Christianity is worth if it be not to make us better foes, as well as better friends. You have heard of the Knights of the Round Table, Dick? the ring children keep up yet in their play?”

“I dunno know as I 'a heard on them,” said Dick quickly and surlily, for he was half divided between wonder and confusion at the bold interloper's strange, unexpected humility, while he dreaded that Joel was going back to his out-of-season spouting. “An' if I 'a heard on 'em, I dunno know what such shams 'a to do with you and me. They may belong to passon's sermons, or to barn plays, but they ain't my price. I'll tell you what, my lad, seems to me your brain be turned with book know, which you've been mindin' 'stead on your proper trade.”

“Maybe you're right, Long Dick,” answered Joel Wray with a laugh and a sigh. “Forgive me for naming Don Quixote, and bringing him also neck and crop into the discussion. It is a bad habit I always had, too speculative and fanciful by half, my very teachers said. But if you had heard, which I suppose you have not, of that other knight, Don Quixote, you might have capped the Britons with the Spaniard, and pointed your moral far more aptly than I have pointed mine. However, we'll let all the old shams, as you call them, rest in their graves, or better, between the boards of the

books where alone they've had a life, if you will promise me that we shall be friends from to-night. Yes, I will say it, Dick, even for the sake of Pleasance Hatton, who is your price, though the Knights of the Round Table ain't (but you may hear their history from her sweet lips, though you won't from mine), at whose feet we are both fain to lie. In the name of Pleasance, Dick, whom I've a round guess it would please above all things, let us be friends, and take no gross or mean advantage over each other."

"You d' be too fast, Joel Wray," grumbled Dick; "you be a queer customer; I be pounded if I can make you out. But arter what 'a come and gone to-night, and you a-walking there in the night air, a-steam' in your wet clothes, fit to get your death on cold—and you town-bred—from fishin' me out on the Broad, among the feet of Punch, and sorry, too, for the poor old hoss, wool, I suppose we do be friends, sin' you will 'a it, till bettern or worsn come on it."

"If like d' draw to like," Dick said to himself, when the two parted, with a mixture of doubt, admiration, and bitterness, "Pleasance will fall to his lot. I'll be cut out, for he do have a smack on her."

CHAPTER XVI.—LOOKING WHERE DICK WAS DRAWN OUT.

THE misadventure of Dick, with Joel Wray's share in it, and the change it was likely to make in Long Dick's late bad feeling to the stranger, made a great impression at the Manor farm and at Saxford.

Pleasance especially was much interested in it, and never ceased to desire to hear the particulars over again, while she sorrowed for her old friend Punch. As for Lizzie Blennerhasset, the tale of Dick's narrow escape, communicated to her without any preparation, caused her to faint away on the spot, and, after being brought round by rough-and-ready remedies, to continue shaken and weakly for many days.

It was in consideration of Lizzie's illness that Pleasance, in that slack time which occurs just after harvest, seized the opportunity, after service one Sunday afternoon, to offer to take Lizzie out in the little market-cart. Mrs. Balls was wont to drive in it to Cheam and effect such small sales of cheese, butter, and eggs as she was allowed to take for her housekeeping in addition to her wages, and which did not come under the tale of the great sales of cheese between the bailiff and a cheese-factor, who sent over his wagon for the produce.

Pleasance had first accompanied Mrs. Balls in her marketing, and then been occasionally entrusted to do the marketing for the elder woman, when Mrs. Balls did not feel equal to what she was accustomed to regard in the double light of an important duty and a great treat. As a step to this promotion, Pleasance had learnt to drive the little market-cart and its pony, *the* pony at Manor farm. Pleasance took some pride in the accomplishment, though it was by no means uncommon, three-fourths of the young country-women, servants or poor farmers' daughters in the farms around, being able and accustomed to drive such carts to market.

At first Lizzie would not be persuaded to go and get the air, though Pleasance had out the cart on purpose, and had come over to fetch her, and though any other Saxford girl would have grasped at the simplest form of an outing.

"I 'a no mind to go abroad, Pleasance, thank'ee all the same," said Lizzie, with the languor of shaken nerves and depression of spirits.

"Come, Lizzie," urged Pleasance, "it is a jewel of a day, not too scorching or dazzling. I'll take you round the Broad, and we'll have a look at the wild ducks and the plover, though this ain't their best season; I wish you saw them in winter among the ice," said Pleasance, bringing forward the inducement which would have been most powerful with herself, "I'll bring you back with an appetite for tea, see if I don't."

"Could you take me round to that there place where Long Dick fell in?" asked Lizzie, tempted by the mention of the Broad, a morbid craving rising up in her wistful, blue eyes, "I 'ould like that just, for I dream on it, nights," she added with a shudder.

"To be sure I could take you, but if it mingle with your dreams, why go after it waking? It would be better if you could forget it, Lizzie; Long Dick is none the worse, he is all the better of a gallant act done for him, for Dick is not the man to fail to heed or to forget gallantry in a neighbourhood. Your cousin is gallant himself," said Pleasance, able to afford to praise Dick, with a warm colour in her cheek, which was not for Dick. "The only precious thing which was lost in the Broad was our poor old Punch, whom you did not know from any other horse, that you should go and look at the place where he came by his end."

"I 'ould like to see if the place come nigh-hand to what I see it in my dreams," persisted Lizzie.

"Very well," said Pleasance, not disinclined to the pilgrimage on her own account, "you will get the fresh air all the same, and perhaps the sight of the real place will satisfy your mind, and prevent you dreaming of it any more—only I know it very well, and I dreamt of it last night," admitted Pleasance, drawing a long breath, and with a far-away look in her hazel-grey eyes, but not as if the dream had been altogether disagreeable to her, not even though Dick and another had been in peril, and Punch had perished.

Lizzie was lifted into the cart with less remark than might have been expected in Saxford on a Sunday. Of course its population was doubled on that day, while its young men and women were loitering about in their Sunday clothes, whether they had been to church or not, and its older men and women were at least "tidied up," as in honour of a festival. Certainly this view of the Lord's Day was not altogether mistaken, if one went back to the original Sabbath, for it was held as a festival by the Jewish people—a festival of so sacred and inalienable a character, that a provision was made for the exception of the Sabbath in all ordained seasons of fasting.

But Sunday leisure and company in Saxford only implied quadrupled facilities for gossip, and Pleasance and Lizzie's exemption from having their whole history and prospects raked up, and their escape with no more than a passing comment resulted from a diversion of public attention occasioned by the recurrence of the great Sunday afternoon event, which never palled in interest to the minds of the villagers.

When there was no special custom at the Brown Cow, Host Morse paid his hebdomadal piece of attention to his spouse, which happily answered the double purpose of occupying and enlivening himself during hours that might otherwise have hung heavily on his hand. With a noisy, hilarious clatter and bustle, belonging to the man, he yoked his much-vaunted bay mare into his dog-cart, ostensibly for the benefit and pleasure of "the missus."

She, on her part, received the act of gallantry with a double infusion of her usual elaborate modesty and meekness, while she extended the boon to three or four boys and girls, children of one of those female relations of Mrs. Morse's, who frequently visited her in

the plenty and stir of the Brown Cow. These children were crammed in wherever they could find standing room, and as they had frequently to be caught and dressed for the excursion at the last moment, with Host Morse and his mare fuming alike over the delay, the starting of the cavalcade was not only a thing of time, but was attended with much commotion. All the population looked to it for their Sunday afternoon spectacle, especially Mrs. Blennerhasset waited devotedly upon her crony to the last moment.

Thus the two young women got away almost unobserved, and drove off through the lanes, which, in spite of the treeless character of the neighbourhood, were rendered bowery by the degree to which the thorn hedges were crossed, tessellated, interlaced, and hanging all waving with an exuberant growth of brambles and dog-roses, travellers' joy, and briony. The profuse harvest of haws was already crimson. The abundant hips of the dog-roses were orange; here and there a knot of flowers, changing from white to peach-colour, crested the countless clusters of rough berries—still green, not black—on the brambles. The great round leaves of the briony were still more like vine-leaves than those of the bramble, and the bunches of the green briony berries might have stood for tender grapes but for their clear solidity. The travellers' joy presented innumerable tufts of down, and bore out its country name of "Old Man's Beard."

The hedgerows were rich, though they were not quite ripe, as Pleasance and Lizzie regretted, that Pleasance might have gone out and picked blackberries, and they were agreeably suggestive even without the hedge-sparrows and linnets, bees, and spiders in their webs that Pleasance was constantly detecting.

Lizzie's spirits rose with the change from the smith's house to the lanes, and with the motion which did not fatigue too much, rough as it was, in spite of Pleasance's efforts to exert her best skill in behalf of her friend the lame girl, whose ordinary mode of progression was the much more laborious and painful mode of walking.

Lizzie was nearly cheerful, for a hopelessly love-sick and ghost-ridden girl, when the cart drove up to the Broad—a different Broad from that which had mirrored the louring night when Long Dick had taken his way home by its skirts, and had all but fallen a victim to his confidence in its shallows. The great sheet of water lay sleeping, not gleaming like steel—for it was not a

dazzling day, as Pleasance had said—under a fair afternoon sky. Flocks of birds were coming and going over it, piping and screaming as they went.

The barges and wherries that on week-days often crossed the Broad, which was the connecting link between several of the slow, brimming rivers of the country, were in a great degree wanting on a Sunday afternoon, though one clumsy, lazy-looking, red-sailed barge lay gently swaying at the far end. There was also an absence of the pleasure-boats and fishing-boats belonging to a few boatmen, whose houses bore the name of Broad End, and were presided over by the Angler's Inn, with hop-poles in front and a tea-garden behind, the whole dimly discernible as a patch of weather-stained, red brick, from the other extremity of the Broad. The little colony was mostly patronised by visitors from Cheam, and although some of them straggled over on Sundays, as a rule they were lacking. As for the windmills in sight, they were of course still.

But the great Broad, its fluttering, screaming birds, and its speck of a boat here and there, with the faint sound of distant oars, and the remote echo of distant voices, to break still farther the silence, did not strike Pleasance and Lizzie as at all dreary under the summer afternoon clouds.

Neither were the women left to experience any feeling of solitude in the scene. Pleasance had not driven many yards along the road, which ran by the edge of the water, before the cart and its occupants overtook Long Dick and Joel Wray, who had strolled over in the Sunday afternoon's leisure, from the farm, drawn, and that together, in their turn, by the recollection of the threatened tragedy in which they had played their part.

The young men hailed the women, and hastened to give them the advantage of their knowledge in pointing out accurately the various localities of the story. At yonder corner Long Dick had taken to the water—a little to the left poor Punch had gone down—from that group of flags Joel Wray had spied the fallen man and horse, and first waded and then swum to the spot where they were disappearing. When Pleasance had craned her neck, and rivetted her attention on the absorbing particulars, and Lizzie Blennerhasset had quivered and shivered anew to her heart's content, Joel Wray proposed a little change in the proceedings.

"Ain't you tired jolting along?" he addressed both the girls. "Couldn't we leave the pony and cart somewhere, and go out

for a little sail on the water?" he suggested to Dick.

Long Dick entertained the proposal in his deliberate fashion. "Powny ain't restive, and might be tied to Tim Burford's boat-pole, which he have fixed on his own account down here. I know my man, and 'ould borror his boat for as long as I pleased, athout offence. What do'ee think, Pleasance?"

"I did not engage to drive home before five o'clock, when I must give Mrs. Balls her tea in time for going to the evening service. It is three o'clock now," said Pleasance, conscientiously but longingly. "I don't think it would be doing wrong. It is not like having out boatmen on the Sunday. We are here at any rate, and to be sure the motion would be very easy, and the Broad air good for Lizzie. Would you like it, Lizzie, or would you be frightened?"

"Not when Dick is here," said Lizzie, without dreaming of equivocating with regard to her supreme trust in Dick, "though it weren't your notion, Dick, you be minded to go, bean't you?" She put it in an undertone, only anxious to hear and meet Dick's views on the matter.

The pony and cart were fastened securely to the boat-pole, and the pony put on honour by getting the rank grassy margin of the reeds on which to whet its afternoon hunger. The men got afloat Tim Burford's boat, which he kept conveniently for any custom that might arise at the more solitary end of the Broad. Dick lifted Lizzie kindly, and deposited her first, and with every precaution, on one of the seats. The movement was still more to his credit because it left Joel Wray free to help Pleasance, but she needed little aid save the touch of the tips of her fingers to steady her as she sprang into the boat.

There was only one pair of oars, and the men took an oar apiece—Joel, who somehow had the ordering of the boat, announcing that there was no steering required on a great mill-pond like this Broad.

The boat shot out from the shore; and Pleasance, who had actually never been in a boat either on the Broad or any other sheet of water before, took in the whole surroundings with a satisfaction approaching that of Lizzie Blennerhasset's. She, sitting at Dick's side and looking up in his face, was as happy as she believed she could ever be, and with undisguised and scarcely stinted happiness, though she felt that his eyes roamed past her in order to rest on Pleasance Hatton.

"WHAT SHE CAME THROUGH."

Page 296.

The sky was all covered with little, dappled grey-white clouds, not so close set but that the pale blue could be seen between them. The clouds looked soft as the down on a young swan's breast; and the sunlight which was behind them, together with the blending of the blue and the grey, gave to the whole a delicate dove's-neck tint that was transferred to the water, though there

was not depth of cloud or sufficient light to reflect the clouds in the water, only where they were nearest the sun and pierced by its rays, so as to be silvered into a snowy whiteness, they threw a dim glory over that portion of the Broad.

Pleasance looked round on the little company, of which she formed one, moving with a motion as Elysian as everything else on

Page 291.

the Broad, which had become an enchanted lake for the occasion. She could not see herself, but she almost thought that the others were enchanted too, touched at least with the full radiance of their youth which was then revealed.

There sat Dick with his magnificent proportions set off as he threw out his broad chest, worked his sinewy arms, and flung

back a head massive as a Jupiter's to look behind him; while Joel Wray, slim but athletic, did his spurt of rowing with what to Pleasance's utterly uninitiated eyes was marvellous ease and grace, and smiled back at her out of the black eyes in the animated brown face.

As for Lizzie, her small white face and flower-like blue eyes which were similar to

yet different from Dick's steel-blue eyes—were all refined by suffering and by a love so great that, however it might end, it had in its present self-abnegation something of the attributes of the worship of a saint, or of a higher worship still. That love lent to the worshipper a serenity which is rarely bestowed by earthly passion. And the peace and blessedness of being in company with and cared for by Dick raised Lizzie's type to its highest perfection.

It did not detract much, though it took a little, from Dick and Lizzie's looks that they were in holiday dress: Dick in that treasured cloth coat and figured waistcoat in which, if the poor fellow had only known it, Pleasance always felt that he looked his worst, because least at home and most out of keeping; Lizzie in that flutter of flounced French mousseline-de-laine and Swiss bodice, of a different colour from the skirt, which formed the chief advertisement of her calling, "like a pattern card," Pleasance could not help saying, "with the poor soul lame and sickly, so that one grudges her the trouble, not only of making but of putting on such a dress."

Doubtless because Pleasance was a class convert, or pervert, she was so staunch a working woman that she would make very little difference, and that never out of her adopted line of life, in her better clothes. She would have her calicot gowns of a finer quality, as well as fresh and clean, for Sunday, and she would go the length of a straw bonnet with white ribbons; but she went no farther, either in material or making. Joel Wray, too (it might be because in his tramping the country he was in a transition state), had nothing smarter than a suit of clean working clothes, in which he had been to church that morning, unabashed by any question of fit attire.

The party were in apparent, nay, for the moment, in real harmony, whatever soreness and rebellion of heart were crushed down. Long Dick had responded to Joel Wray's appeal, powerfully seconded as it had been by his service to Dick, that the two should prove friendly in being fair foes.

"Look here, Long Dick," Joel had said, again forcibly in gladly acknowledging Dick's submission to Joel's advances, "no woman in the world, not Pleasance Hatton, without equal as we think her, is worth two honest men who might be faithful mates, and do a world of good to each other, quarrelling; and Pleasance, being a good woman, would be the last to wish us to

quarrel. You desire to meet Pleasance's wishes, don't you? I am sure I do."

It was a new light on the question to Dick, but it was not too late to receive it; and though it was difficult for a man like him to get fresh illumination on any point, he had one advantage—not unfrequently possessed as compensation by heavy, unscholarly men—that once got he retained every glimmer, and did not let it go again the next moment.

Lizzie had, of course, been greatly touched in her previous hostility and scorn of Joel Wray, by what he had done for Long Dick, though in her secret mind she had been convinced that the doing had not all been Joel's, that, on the contrary, Dick had helped to the extent of lending a hand to Joel Wray, to deliver Dick's self. Still, Lizzie had been moved to say to Joel Wray, "Me and all Dick's friends, mind, are beholden to you to the last day of our lives;" and although she thought no more of him, in Dick's company she was in perfect amity with the other lad.

Joel was discussing with Pleasance and Long Dick such Broad birds as came within sight of them, and in place of being instructed by his friends, it so happened that he was giving them instruction as to the tokens and habitat of such birds as the golden plover, "with its bronze and buttercup tinge," and that belonged of rights to the fens; the snipe, with "its beautiful mottled velvet," which Long Dick and Pleasance called, according to its melancholy cry, the "pewit;" the wild ducks, "with green on their neck, like salt water pools in frosty weather;" the little quail, "that people might see running along and pecking the chickweed among the stubble;" the carlew and the widgeon, which hailed from Cheam and the sea; the red shanks; together with other birds which migrated in winter from Scotland and Denmark and Norway.

"Hullo! you be more up to them birds than we, who are to the place born," said Long Dick with considerable mortification. "How do a town mechanic come by such acquaintance? He don't get it all out o' books, do he? It seems as though you 'a sat and watched at times, and had a shot at the creatures, as well as I."

"I told you that I was part country bred," said Joel quietly. "I have watched and had a shot at the birds, and, if Pleasance and Lizzie will forgive me, I wish this were not Sunday, and we had a gun apiece, and could take a pop at that flight. There are birds, and to spare, about the Broad, Pleasance; there would only be more food for those that

remain, and you should have specimens to stuff, and get wings for your hats."

"I would much rather have the live birds than the stuffed specimens, thank you, Joel," said Pleasance, "even if I could get the dead birds stuffed, and I should not think of wearing a bird's wing in a hat."

"I 'ould, if I could get the chance," said Lizzie. "A bird's wing in a hat is just smart and stylish; but you do be so fond o' goin' dowdy, Pleasance."

"I know I ain't smart enough even for Mrs. Balls; but the fault is in my taste. I don't go dowdy as a penance. You know something of tame birds, too," she hastened to add, turning to Joel, and instinctively stopping a compliment which she read in both the men's eyes. ("Though it was Lizzie that brought it on," she reflected, a little annoyed, "I would never have spoken of my own accord of dressing plainly, as if I wanted Long Dick and Joel to say that I dressed well enough for my station, or that I became what I did wear; I should be ashamed and angry if either of them said that.") "I have seen you looking at our cocks and hens," she continued aloud, "and you told me that we had not the best Dorlings, but that our Spanish fowls were good."

"Yes," admitted Joel quickly. "I know something of poultry; I have rather a taste for the subject; indeed," he added with greater frankness, "I think I know a good deal about farm stock, for a town fellow, Long Dick; though I was a tyro, a raw hand at the hoeing, yon beastly cold spring morning when I first turned out among you in the Thirty-acre, and I was not much better when I began to shear in the harvest row, though I made a good beginning. I did well then," he finished, with a bright look at Pleasance, reminding her of all the day had been to them, and of the harvest that had sprung up for them, apart from the grain which they had cut side by side.

Whether Dick intercepted the look, or was simply exasperated by the lad's conceit, he put him down a little, with dryness, in the following speech:—

"I dessay you do know 'a B from a bull's foot,' which may be summat for a Lunnon mechanic; but as to cow ill, and hoss's bats, and sheep's staggers, and swallin' on clover, and killin' a bullock, when the butcher ain't at hand, I guess you'd find yoursen from home, my lad."

"Oh, I don't pretend to be a man of skill and an accomplished farrier like you, Long

Dick," said Joel with his pleasant good humour and humility, which ran side by side with, and counterbalanced what sounded like egotism and arrogance; "and I was going to tell you one reason why I came to know what I do about a farm. My father came from the north of England, whereas I understand his people were of Scotch extraction. Any way, my grandfather had a small farm in a Cumbrian dale, and my grandmother used to drive to Penrith market in just such another cart as you were driving, Pleasance, with her butter and eggs and cheese for sale. My father, though he left home betimes, and took to another calling, remembered his boyish days quite well, and was fond of speaking of the thrifty, wholesome place, and of the animals he had helped to herd as a boy, to me and my sister Jane when we were children."

"You mun 'a fallen down in the world," said Long Dick simply, without the least idea of giving pain or offence, merely as an appropriate remark.

"Well, we have changed," said Joel, "whether in a fall or a rise. You must remember these north-country farms were very poor affairs, and my father left his father's house to work as a factory hand; I suppose I take after him, in retaining a strong liking for all that belongs to agriculture, though I have been more familiar with mechanics and manufactures."

"I take it you 'a been," said Dick; "for you d' be fit for nowt save odd jobs, though I ain't, any ways, denyin' you be both clever on a farm and willin', and no doubt you do earn your man's wages at your proper work, if you can make no more'n your salt here."

"I am glad you are a little merciful, Dick," said Joel; while Pleasance judged indignantly, without making allowance for Dick's bluntness, that he was hard upon Joel, who bore the hardness so well, that, in place of her firing up for him, something like tears came into her eyes as she looked another way, because of the gentleness of the young fellow, who, she was sure, was the cleverest as well as the bravest working man in the world.

"Ain't it kind o' queer," said Lizzie Blennerhasset, breaking a pause, "that we should be sailin' in one boat? I mean Dick as saved I from the fire, and Joel Wray as saved Dick from the water, all here together."

"But nobody saved me," said Pleasance lightly, "and I have saved nobody. I don't seem to belong to the rest of you."

"Nay—" said Dick, stopping short.

"There's a good time coming," said Joel

impetuously ; but both of the men respected the girl, and did not push the denial farther in that company.

"I suppose it would be better still, for those who are not afraid or ill, to be rocking on the salt sea," said Pleasance. "I can but get a glimpse of the sea when I go to Cheam, either with or for Mrs. Balls. It tantalizes me a little, for I have just a moment to run down to the beach, where it is always crowded, to hear the roar of the waves, and see their foam, and smell them in the breeze, and to pick up and bring away a shell like a child, when it is time to go."

"Wool," said Dick, breathing hard, and pondering a great idea which had come into his mind, "week in, week out, I 'a not had a full holiday this year, and work's slack, and Toosday week be Applethorpe fair, as all the farm hands is free to attend. I could go with you and Lizzie to Cheam for the day, and Joel might come likewise, if he were so minded," finished Long Dick, with a mighty effort at magnanimity, culminating in a gusty sigh, that subsided into a sound which was half a grunt, half a groan.

"Oh, how nice !" cried both the girls.

"All right ; a capital thought !" cried Joel.

"Owd granny 'ould be greatly pleased to see us," said Lizzie, "and 'ould do the best her could for us in her little room."

"As for that, Joel and I 'ould get what we wanted at the Ship A-hoy, and not trouble owd granny," amended Dick ; "but we should 'a hours to spend on the sands. We might go as far as the Beacon, and 'ave a real sea sail, besides seein' what were to be seen in the big town."

CHAPTER XVII.—TO SEE THE SEA.

THE project was put into execution, much as it had been planned, only with a decided improvement. As the season was so slack for farm work it could be managed that the little party should drive over the night before, find quarters—the girls at "owd Granny's," the men at the Ship A-hoy, and have a clear day before them—or at least, till late in the afternoon, when they must start again for home—for their enjoyment of the sea and of the big town.

The market cart and pony were held sufficient for the party's needs, since these well-fed, hardy, market ponies were accustomed to convey loads, human as well as vegetable, and since Long Dick, and Joel, and Pleasance also, would alight to walk up every hill rather than that their beast should be overstrained.

The day was not so softly sunshiny as on the previous Sunday, it was a little bleak, with a slightly scouring wind, as even early autumn days, when the wind was several points east, were apt to be in that region. But it was fair, which was a great gain, and promised to be fair, according to the weather-glass, and to Long Dick, who, from long and close observation in the fields, was a weather-glass in himself.

Pleasance consoled herself for the dullness and coldness of the weather with the thought that it would not be dull on the sea with that little gale which would bring out the sea-horses, and Pleasance desired earnestly to see them with their manes in full toss, and forgot for the moment how hard it might be to ride them in that case.

The occupants of the cart enjoyed the peculiar exhilaration which belongs alone by inalienable right to working men and women out for a holiday, as on the Monday afternoon they started from the Manor farm door. Mrs. Balls insisted on supplying them with provisions, cold meat-pies, and baskets with bottles of ale, and cider and elderberry wine, as if they were to camp out irrespective of "owd Granny" and the Ship A-hoy. She called after them directions and advices, shading her eyes, though there was no sun to look after them, and returning into the house when they were gone, shaking her head because of the intrusion of Joel Wray into the picture—not that she had aught to say against the young man, save that he was a wandering Jew, and a stuck mechanic, and if Pleasance would throw herself away on him, why Pleasance was woman-grown, worked for herself, and must please herself. Mrs. Balls did not think for a moment that Pleasance would desert her old cousin, for Pleasance was good, and only too unworldly, but everything would have settled itself so "comfably" if Long Dick had remained the only man in the scene, and had been promoted to be under bailiff, and Pleasance had married him, and wife and husband and Mrs. Balls had stayed on managing the cattle and making the cheese on the Manor farm.

Pleasance had voluntarily resigned the reins to Joel Wray, for though it had been understood at first that Long Dick was to drive, when he chanced to bid Joel hold the pony till Long Dick got in after their first walk up hill, Joel handled what he called the "ribbons" so neatly—as he did many things, and with such manifest relish, that Long Dick, who was no churl, permitted Joel to please himself by doing the driving that was no novelty to Dick.

Pleasance and Lizzie sat behind, and told each other that it was a treat to have a little spell of sitting still with their hands in their laps. ("Just a very little spell," Pleasance put in parenthesis, because it would soon pall, and what is a delight for a change would be irksome for a continuance.) And it was a greater treat to be driven along a country high road by friends in order to command a whole holiday next day.

The approach to Cheam was heralded by ships' masts on the horizon, and by the white steam-wreath, rattle, and whistle of a railway. Still nearer there were poles with fishers' nets drying, and donkey carts with fish—allowing Pleasance opportunities to pity the poor "Dickies," and to long to have one to make something more of him, and there were fishy odours reminding the travellers that Cheam had its extensive fishery as well as its seaport trade.

The entrance to the town was across a bridge, spanning a river so near its mouth, that ships of a fair number of tons burden sailed up beyond the bridge. It was so contrived and worked by machinery that, in the anticipation of a ship's passage, the bridge divided in the middle, and the two halves were reared aloft by cranes, leaving an open channel for the vessel to sail through. In the mean time, carriage, horse, and foot passengers were fenced off by two chains, and stood gathering as they stood, regarding with what philosophy they might, the yawning watery chasm, and the ship gliding over it, till the leaves of the bridge descended and closed on the ship's rear, and there was again a solid way for landsmen.

Pleasance had often seen and watched with interest this process—from the last curricule and foot-passenger that darted across when the chains rattled down, and the bridge itself quivered and began to split—to its lumbering, creaking divergence and upheaval to let, what looked by comparison the tranquil graceful ship, sometimes a yacht or barge, sweep by—on to the moment when the bridge was reconstructed, and a rush of the impeded crowd of horse and foot clattered simultaneously over its wooden highway, with a speed that seemed seeking to make up for lost time, and bidding the devil take the hindmost.

Such an obstruction and delay occurred as the market-cart, driven by Joel Wray, came up to the river. The party formed, a little cluster in the crowd that had to pause and readjust itself for crossing the bridge. There

were a carriage and pair with ladies and gentlemen inside, a cab or two—carrying railway travellers, as well as a score or more of foot-passengers, biding their turn. The carriage with its couple of horses sought to take the precedence, but while the cabs gave way, Joel resisted the movement, and, whipping up the pony, sent the market-cart with a dash that was not without danger, flying first, to the disturbance and discomfort of some of the party in the cart, as well as of the carriage company behind them.

"What did you do that for?" cried Dick, angrily, "you hadn't ought to do that; if I had known, I should not 'a trusted you to drive—not over the bridge leastways. That be Sir Frederick, Lawyer Lockwood's master, no less, and his company. Cheam folks beant over particular, as you may find to your cost, for they will dig their elbows into your sides, and knock you out on the way of their business, if you stand about, be you man or gentleman, gal or lady, and think no more on it, than if you were so many sheep or calves, and if you flare up and show your fists, they will square back and knock you down, or be knocked down theirsens as easy as you say 'Jack Robinson.' But they beant so choke full on sarce and folly as to drive a market-cart right afore Sir Frederick's carriage, as you 'a thought fit to do. Dang it, lad, we may lose our places for this piece of cheek, if so be it comes to Lawyer Lockwood or bailiff's ears."

"I do not care who it was, unless it nad been the Queen herself," said Joel, half hot, half sulky; "we had the place, they had no right to push by us and usurp the lead."

"If you dunno know the difference between right and might at your years, after working all your days, it is little wonder that you're out on a job and serving as a day's-man on a farm," said Long Dick, with a mixture of superior scorn and sincere commiseration.

But the discord did not last long; Joel Wray's heat and sulkiness, which was unlike his ordinary patience and graciousness, soon subsided, and he was more anxious than any one there to have his outbreak forgotten and to make up for it, by agreeing to everything that was proposed, and accommodating himself in the readiest and most cheerful manner to circumstances. Therefore the others consented to condone the inopportune offence, and to drive for his benefit through the market-place, which was well known to his companions.

It was not a market day, as Long Dick and Lizzie, and even Pleasance, regretted feelingly, but the market-place was in itself a

sight. Joel eagerly acknowledged its attractions—its free space between the old established busy shops, with quaint, little diamond paned, bow windows, and its venerable flint-built, stone-roofed church at one end. When the stalls were full and a concourse of country and town people chaffering together, Joel was convinced that it would be as fine and exhilarating a sight as Pleasance told him it was.

From the market-place they drove to the principal quay, which had a line of what had once been Cheam merchants' roomy, substantial houses, as well as warehouses, with a row of elm-trees between the houses and the water, and underneath the trees large ships lying loading and unloading.

"It is like Rotterdam," said Joel.

"I h' ain't tackled Rotterdam any more than Lunnon," said Dick, "be it Lunnon ways?"

"A little beyond, as I have heard," said Joel.

From the quay the market-cart, with Lizzie in it, was led up two or three streets, after the others had alighted to walk, for the town ran with a steep ascent to the exposed height from which it looked over the German Ocean—limitless as far as the eye could follow. Down the lanes which were abrupt declivities, but which were not the ancient, narrow, yet populous, "rows" of another east country town, the party had little glimpses of the sea which they had come to visit, and Pleasance hailed it with a breast heaving in sympathy with the heave of that sea whose vastness, and might, and mystery, its ceaseless murmur and its tragic depths appeal so irresistibly to all unvisited imaginations. It was a grey-green sea that day, just flecked with cold curls of white, beneath a slaty grey sky; the very ships which appeared on the horizon were blue-black ships relieved on the lighter grey background.

Poor Lizzie was so fatigued by the drive as to be able to do no more than go to Granny's, and prove the judiciousness of her having secured a night's rest after the journey, before the more deliberate and prolonged sight-seeing of the morrow.

Accordingly, the young men contented themselves with taking the girls to their destination, and resisting Granny's clamorously-piped hospitality, betook themselves to the Ship A-boy, and their own resources for the rest of the day, on the strict understanding that all should be up and ready and meet to go abroad early next morning.

Granny's house was but a couple of thatch-

roofed, well-stuffed rooms, at the head of a lane, in a house whose bulging walls, projecting second story, and lattice windows, showed a very respectable antiquity of its own.

But though Granny's accommodation was limited, it was not poverty-stricken, neither was she in indigent circumstances for her station. Her husband had been a successful fisher and owner of several boats, who had escaped shipwreck, died in his bed, and left her perfectly independent of her daughter, Mrs. Blennerhasset, or any other children that she had borne him.

Granny herself was a dried-fish of an old woman, in a blue flannel gown, like a bit of a sailor's jacket, while she wore heavy gold rings on several of her skinny fingers. Her whole heart was still in the exciting records of the sea and the fishing, and her great regret was that none of her sons had taken to the sea, or her daughters married fishermen or sailors. "Thee has turned thee's backs on the sea," she reminded Lizzie reproachfully in the same breath with her welcome, "though it were a good sea to thee and thee'n; thee's a parcel on land lubbers, as I am fair ashamed on, even Clem as were half reared here, d' find no good in fish save to eat."

At the same time she was glad to see her visitors, and to show Pleasance Granny's sea-port treasures of shells and coral, sea-weed, and stuffed sea-birds, with which the best room was decorated, and to find in the young women attentive listeners to her full report of the fortunes of the year's fishing. She cared little for hearing news of Saxford, where her daughter had married that magnate, the smith. He was no magnate to "owd Granny"—what warfare with winds and waves did he maintain? For how many nights, and days like nights, had he not been heard of, lying with tightly-furled sails rising and sinking on the crests and in the troughs of the billows? Or when did he return in triumph with the waves and winds beaten into his humble servants, and his gunwale weighed down to the water's edge with a freight of fish which filled his purse at one take, and gave plenty to his house for many months? The poorest fisher-lad on the beach, the smallest cabin-boy, had the making of a greater man in him to owd Granny, in her fervent loyalty to the sea and its spoil, and to those who went down to take it, than smith Blennerhasset or host Morse or Long Dick, all put together.

"Has she never lost any friend by the

sea?" asked Pleasance of Lizzie, when the old woman had left the room for a moment, after she had poured forth her details of bait and lines and weather, of lucky and unlucky boats, of the first tail of a herring on the coast, and the apprehended arrival of the mackerel, with those necessary but duller adjuncts of sales and prices.

"Mor, yes," said Lizzie. "She lost two on her sons, and her father and his sons; but she thinks them were well bestowed, and met an honourable death. Still, she ain't a bad granny, though her head do be carried by that howling, moaning sea, that atween you and me I cannot a-bear, Pleasance, though I 'a come so far to see it, for a change. It is a pleasure to please Long Dick and you, as well as get an outing mysen, so you need think no more on my words. As for Granny, she paid the sea hard enough service in her day, for she were fisher-born as well as fisherwed, and she carried a heavy basket strapped on her shouthers, and tramped miles on miles—afore her man, my grandad, saved money, or carts and railways were so thick—many's the day. You wunno be afeared, Pleasance, and wanting to run for help to the lads at the Ship A-hoy," continued Lizzie, smiling, "if you hear Granny's voice raging like a kiln, and blackguarding right and left a neighbour or a message-lad afore we are out on our beds the morrer morning. It's a ill-conwenient trick she learnt when her were a fish-wife. She beant a bad body, take her on the right side. She were a good wife and mother, and she were rare kind to Clem and me, when he were at his schoolin' and I were at my quarter's dressmakin'—though, mind you, she thought we was dirt aneath the fisher-folk's feet all the time."

Pleasance promised not to be frightened, and declared sincerely it was refreshing and humbling at once to be with Granny, and find all Saxford and its affairs sink into insignificance before the interest of cockler or shrimper.

CHAPTER XVIII.—CHEAM DENE AND THE BEACON ROCK.

PLEASANCE had not the chance of getting her nerves tried by Granny's bad habit of scolding, for the reason that they were tried in another fashion. Granny's once-powerful voice, broken and passed into an ear-piercing treble, was utterly drowned in the gale which had risen through the night, and wakened both girls betimes with its sustained roar, just rising above the hollow heave and hoarse dash of the sea, and the

rattle of the sand and the small shingle which the wind carried with it and threw against every obstacle.

Pleasance listened for awhile with a kind of awed eagerness, while Lizzie was bewailing the destruction of their schemes.

Pleasance had wished to see the sea rising in angry answer to the wind, and here were they in the full chorus of their fury; but what hapless human beings might not be exposed to the elementary war? and what terrible, pitiful wrecks might not lie behind the poor little disappointment which Lizzie, seeing nothing beyond Long Dick and his holiday, was lamenting with persistent weakness?

As Pleasance lay and thought, almost fearing to get up, a sudden rush of feet and tongues in the lane without added to the turmoil, into which there came also another sound heard distinctly, apart from every other noise, at short intervals—a succession of faint but sharp reports, which, if Pleasance could have attended to the token, and known its terrible import, she would have recognised as the reverberations of a gun fired from some vessel as it neared the shore.

In another moment Granny burst into the room, with a shawl tied over her cap and disordered grey hair, proving that hard as it must be for the young and strong to keep their feet abroad on such a morning, the old woman of fourscore had been out hailing the crowd, and learning from them the last event at the sea. She made her voice heard by Pleasance and Lizzie at last, for she screamed into their ears—

"Thee mun rise; thee dunno know what is in store for thee. There be no slug-a-beds in Cheam this morning. I 'a seen the day I 'ould a been at the Beacon with the best, but now I'm owd and frail; but I'll warrant I'll win as far as Neddy Hughes's look-out. Be'st thee not ashamed to be startin up and gapin' there, when if thee be'st not quick thee'll lose the grandest sight that has been seen at Cheam since the *Betsy*, with Indy tea and chiney, grounded, afore the days of lifeboats. There be a Norraway brig runnin' on the Beacon Rock itsen, in the Gannet Bay, where not the best lifeboat that were ever launched 'ould live for five minents."

If anything were wanted to give force to the statement, there was a strange ring of wild, passionate anticipation in the old woman's shrill voice, which sounded like horrible pleasure, and made Pleasance shudder, and recall her school-girl lessons of the old Roman women flocking out to view the death-struggles of the gladiators.

By the time Pleasance and Lizzie were dressed, Long Dick and Joel Wray came hurrying in, the latter especially in a state of suppressed excitement. They had already been in the direction of the Beacon Rock, to which it was feared the foreign vessel that had missed or mistaken the Beacon light in the wild hurly-burly of the gale which had risen since midnight was surely tending.

The men had simply repaired to Granny's to report themselves before they returned to the scene of excitement.

Long Dick was inclined to tarry a moment, and to lament, like Lizzie, the spoiling of the day's pleasure; but either a day's pleasure was of less moment to Joel, or he had a livelier imagination with which to put himself in the place of the men in the Norwegian vessel that was still beating and battling desperately to get out of the Gannet Bay, and especially to keep off the reef.

Joel was wild to get back, where a crowd of town's-people was already thronging to do what could be done, and look on when there was nothing left to do. He even forgot to ask Pleasance if she would like to accompany them, so that it was left to Granny to suggest the movement.

As for Lizzie, it was simply out of the question that she could venture to limp across the threshold, even to reach Granny's friend's look-out, or to visit her old mistress in dressmaking and get the last spring's fashions, which had been one of Lizzie's objects in her trip to the seaside.

When Pleasance followed the men into the street, she found, to her wonder, that the very light was darkened. It had not been for the most part the smallness of Granny's window-panes, or the thickness of their yellow-green glass, which had produced the semi-obscurity within the house on this new day. There was such a driving wrack of spray and sand from the sea that the air in its high commotion was rendered thick, heavy, and dusk, while as it struck against Pleasance's cheek it wet and stung her like a sharp hail-shower.

She was young and strong, so that she could keep her feet in comparative shelter, and when she turned the corner of the lane and encountered the swirl, or came upon the gust rushing up from other lanes, the men at each side took hold of her arms and helped her to preserve her balance and her breath. She could not attempt to speak, neither could she have heard her own or another's voice in the deafening uproar, which never ceased, and hardly lulled for a few seconds.

Pleasance and her companions were not alone in the storm-scoured street; plenty of Cheam people were abroad, and it seemed that they were all actuated by one motive and bound for one end. Sailors rolled along in the teeth of the wind, with their sou'westers sticking on as if by a miracle; fishers strode forward in their long boots; and porters from the quays and much-blown shopkeepers joined the rout, with the never-failing contingent of women—not many of them so well supported as Pleasance—and boys willing to be blown away rather than lose an adventure. Pleasance was reminded by the independent pushing and striving of the pedestrians, and the coolness with which each jostled another, and took advantage when he could, regardless of surly protest, of what Long Dick had said of the easy manners of Cheam—which she had known dimly reflected in Saxford—in the rudeness and disposition to turbulence of the generally well-to-do fishing and sea-faring world.

As Pleasance struggled along she could see carefully-tended gardens, which had been bright with late summer-flowers the day before, now presenting neither blossom nor leaf as they lay buried under a waste of sand, such as accumulated many feet in winter, leaving the grass-plots and flower-beds to be dug out afresh every spring.

When she came in sight of the beach, it too was undergoing a complete change. The drift there was rising like smoke, and obliterating for the time all the ordinary traces. The boats were either removed from their usual moorings, and drawn up high and dry beyond the risk of being sucked down by the tide, and wrenched from their fastenings; or they had already broken loose, and were knocking about in aimless emptiness, undirected by oar or rudder, on the boiling, seething flood. The grey-green waves of the sea were all flecked with white patches, gleaming ghastly against the lurid red that since sunrise had streamed across the dark field of the sky, with its huge banks of lowering cloud-vapour.

The Beacon Rock was nearly a quarter of a mile from the town, and was divided from it by Cheam Dene, a stretch of waste, sandy land, held together by bent grass, here and there, in the summer season, of a pale yellow colour from a luxuriant growth of horn poppies, which, higher up, passed into the gold of furze and the red of ling. The Cheam Dene was of such an extent that Long Dick had once seen a detachment of soldiers—whose inland bar-

racks were in the process of thorough cleaning—encamped there for a week. The soldiers had belonged to a cavalry regiment, and their fine horses had been gathered into a group, and were standing in the centre, with the tents pitched around, and the stalwart figures of the men in undress lying cleaning their accoutrements and entertaining their visitors in an outer ring, forming a whole, which would have served to remind Pleasance of a scene from *Jeanne d'Arc*, or any other military drama of the Middle Ages. But that encampment had happened in true summer weather, when sea and sky were alike blue, and the former was so still that the trickle of a natural spring of fresh water high up in the Dene could be heard distinct from the low ripple and plash of the wavelets down on the sands below.

But the Cheam Dene showed another sight, lashed by the fierce September storm which was casting the vessel, believed to be the *Christian*, laden with bark from Bergen, upon the Beacon Rock, that, with its tall iron watch-tower—fruitless in this case—lay just beyond. Yet if the furze-covered bank into which Cheam Dene merged, and which in its turn merged into the height on which the higher portion of the town was built, had not partially sheltered the ground on this occasion, no such roused crowd as Pleasance found there could have gathered together, and kept their places and found their voices, in a breathless watch, awaiting the fate of the doomed vessel.

It was hopelessly doomed, and there was little left for the people on the shore to do—unless it were to shout directions in a strange tongue, which the noise of the wind and waves alone would have prevented the shipwrecked men from distinguishing—save to stand and look at the cruel destruction and death that awaited the strange ship and its crew.

The one spot on the whole wide sandy Cheam beach, where no assistance could be rendered to the wrecks, which were not unfrequent there, as all Cheam boatmen well knew, was this Gannet Bay.

The whole of the bay was thick set with jagged rocks, rising like the spears and knives in the pits dug in old-world warfare, to entangle and pierce without mercy the assailants who advanced against the enemy drawn up in line of battle; and with such a sea as this leaping, spouting, and churned into foam around the rocks, Granny had spoken the bare truth when she had said that no boat could live five minutes, while

the life-boat which the town possessed, and which the townsmen were not slow to use on ordinary occasions, was utterly useless.

Thus it came that the men of Cheam, who, whatever were their faults, were no cowards, and who were peculiarly alive to the danger and the suffering involved in a calamity like the present, stood massed together for protection against the blast, inactive, except in bootless gesticulations or in muttered remarks from the men and groans and sighs from the women. They peered through the wrack at the hazy, vibrating outline of the bare poles and half-submerged deck of the vessel, with the figures still working her until she completed the first stage of her ruin. After rushing on, in spite of closely-reefed sails, staggering through the vortex, and giving one bound greater than any she had yet taken, she remained fixed, and quivering to the accompaniment of involuntary, shrinking, appalled cries from the Cheam crowd.

"She's on the rock; she's strook fast, and no mistake. God A'mighty help them! for the question now is nowt but how long 'll her sticks hang together."

But the poor foreigners, in their extremity, knowing nothing of the nature of the coast, were unaware of the impossibility of a rescue. They distinguished through the mist of spray and sand the crowd on the Dene, not so far removed from them even as the crowd descried them, and relinquishing their vain task, clustered about the stern of the vessel. They made an eager appeal to their brethren safe on shore to venture something for their aid. Using one of their few English words, the Norwegians raised a simultaneous shout, loud enough to rise above the turmoil, of "Boat, boat!" where no boat could reach them.

The piteousness of the foreigners' fervent cry, which could meet with no rejoinder, went to the stout hearts of the bystanders, and drew from them deeper groans and more unequivocal expressions of sympathy. "Poor souls, an' we could do summat! But it 'ould be a clean waste on life, and temptation on Providence." "It is your turn the day; it may be ourn the morrer. But we can do nowt; our hands d' be tied." "Leastways our boats 'ould be stove in, and crushed like so many egg-shells afore we could get within arm's length on you," were passed around in short, jerked-out sentences, while men, who were helpless to help, and who could move to no purpose, stirred restlessly to relieve their own pain, and women wrung their hands and began to sob aloud.

THE USE OF WASTE SUBSTANCES.

NO. II.

TWENTY years ago one of the most offensive refuse products from manufacturing industry was that known as gas-tar. It was surreptitiously got rid of by throwing it into the rivers, and formed the ghastly blue patches known as "blue billy." This substance, by the aid of the chemist's art, has been lifted up from its lowly place, and now stands forth as the source of some of the most useful products in the arts; but its horrible colour and odour have been transmuted into the most beautiful dyes, and the most delicious flavours. The offensive refuse, this poor rejected Cinderella, has now become the queen of the by-products of our manufactures. Instead of its being furtively put out of sight, factories have sprung up alongside of the gasworks to enable the chemist to transmute their gas-tar and ammoniacal liquors into a score of different by-products of wholly different natures; and the curious thing is, that many of them are, as if by magic art, elevated from this dire nuisance into materials which appeal to the sense of beauty and delicacy in every form.

Among other products of gas-tar as of insufferable smell is benzole, which, with nitric acid, produces nitro-benzole, a body resembling in odour bitter almonds. It is greatly used for the purpose of perfuming soap. Benzole itself is a body of great solvent powers, and one of the most effective removers of grease-stains known; whereas the source from which it springs is one of the greatest soilers in existence. Naphtha is a product of this tar—the source of light in many factories removed from gasworks; when treated with turpentine it is transmuted into camphine, and illuminates our drawing-rooms. Naphtha is also used in dissolving the various gums, resin, &c., india-rubber, and gutta-percha, and by its instrumentality a hundred new substances are thereby introduced to the world. Aniline, the base of the dyes bearing that name, is obtained from the action of nascent hydrogen, or nitro-benzole. It seems almost incredible that the delicate tones of colour known under that name should issue from so foul a source; but so it is. The arts would, indeed, be deprived of one of its most beautiful embellishments if this new agent had not been discovered. A brilliant yellow is again produced by the action of nitric acid. Carbolic acid is converted into carbazotic acid. Even

red dyes, but of a very ephemeral character, are produced from naphthaline. Almost all the colours of the rainbow issue from it; but the absence of all colour, lampblack is made by burning with slight access of air the least volatile components of gas-tar.

Among the light oils of tar are some which, mixed with the heavy oils, are effective in preserving wood from rotting, and the tar creosote, carbolic acid, which is a most powerful antiseptic, and one which will come greatly into use now that the nation is becoming more careful of its health. The production of alum and sal ammoniac, although it cannot be said to be recovered from the refuse of gasworks, can with truth be said to be produced from the refuse of coal mines—the shale which roofs them in. Formerly this was a waste material which occupied a vast space, like the spelter heaps. It is now utilised by our dyers and colour printers to fix their colours. This product is made by setting fire to the shale, and heating the residuum in iron pans with sulphuric acid, with the addition of the gas liquor, when the result is ammoniacal alum.

"Perhaps," says Mr. Simmonds, "the most interesting of all the products of coal tar is solid paraffine, a colourless, crystalline, fatty substance, which may be truly termed 'condensed coal-gas.' It is found naturally in the coal measures, and other bituminous strata constituting the minerals known as fossil wax, ozokerit, &c. It consists, also, in solution in many kinds of petroleum, and may be obtained by distilling off the more volatile portions, and exposing the remainder to a low temperature. The greater bulk of paraffine is, however, obtained from coal-tar. The oil produced from paraffine will only burn in the presence of a wick, and is, therefore, perfectly safe; when burning it splits up into olefiant gas, thus producing a brilliant white light." We could go on giving a number of other by-products which have grown out of the utilisation of gas-waste; but we fear the reader would grow weary. We may say, however, that chemistry is by far the most fertile agent in turning so-called refuse into manifold new uses. Her magic wand, as we have seen, has only to touch the most noisome substances, and the most ethereal essences, the most heavenly hues, the most delicate flavours and odours, instantly arise as if by magic.

Let us (by way of parenthesis) address the ladies for a few moments, to show them a new means of occupation, and, indeed, of profit. We have lately found out that the beauty of flowers and the pleasure they afford is only a small portion of their value. Chemists have lately discovered that they are great purifiers of the air, inasmuch as they produce a large amount of ozone—a quality of the atmosphere which burns up malaria and other impurities. If we may use the term, flowers, the most beautiful earthly objects, are the true scavengers of the air, not only giving out the most delicious odours, but destroying those which are inimical to human health. Let us hope that our fair friends, by the cultivation of window-gardens, may aid the sanitary conditions of our households. Living flowers, under their care and culture, are far better purifiers of the worn-out atmosphere of our households than many of the concoctions of the chemist.

But whilst thus gracefully employing themselves, they may at the same time turn their labour to profitable account. Why do we waste the delicious odours of our flowers? No doubt it is simply through our ignorance. The ladies would say, "Show us how to improve the essence of a rose, or fasten down the odour of heliotrope, or confine the perfume of orange-blossom?" The way is very simple; and, strange to say, the fetters of these light airs are of the grossest kind—purified fat. Mr. Piesse tells us that the method of obtaining scented pomades is the easiest thing possible. If there is such a thing as a clean glue-pot in the house, throw into it a little of this purified fat, warmed sufficiently on the fire to make it liquid, and throw into it as many heliotrope flowers as possible; let these remain for twenty-four hours, then strain off the fat, and add fresh flowers to it; repeat this process for a week, and the result will be pommade à la heliotrope, and such, Mr. Piesse says, as cannot be got for love or money from the perfumers. Other flowers may be treated in the same manner, and thus turned into pomades. The method of liberating the essence of flowers from this fattiness is very simple. The fat is cut into small cubes, and placed in spirits of wine, and the delicate odour immediately transfers itself from the coarse fat to the spiritual solvent. Thus pomades and essences are readily made at home, and, we may add, that they will pay for the trouble of extracting them. "I will buy any amount of heliotrope pomade that I could

get," says Mr. Piesse; "the ottos of orange-blossoms and jasmine flowers are as valuable as gold, weight for weight." He says again, "And for all these we have to go to France. In our colonies vast quantities of these—and, indeed, of every flower—go to waste; why," asks this gentleman, "should we not grow flowers for the nose as well as for the eye?" The query is a very pertinent one.

Some of the most delicate perfumes and flavourings, however, find their birth in matters far less ethereal than the flowers which nature gives us. Very many of them are concocted, as we have already shown, from the disgusting refuse of our manufactories. Professor Playfair, in one of his lectures delivered some years ago, says, "Singularly enough, the most delicate are generally derived from substances of intensely disgusting odour. A peculiarly fetid oil, termed 'fusel' oil, is formed in making brandy and whiskey. This fusel oil, distilled with sulphuric acid, and acetate of potash, gives the oil of pears. The oil of apples is made from the same fusel oil by distillation with sulphuric acid and bicromate of potash. The oil of pine-apples is obtained from the product of the action of putrid cheese on sugar, or by making a soap with butter, and distilling it with alcohol and sulphuric acid, and is now largely employed in England in the preparation of pine-apple ale: oil of grapes and oil of cognac, used to impart the flavour of French cognac to British brandy, are little else than 'fusel' oil. As we have said before, nitric acid acting upon the foul-smelling oils of gas-tar produces the oil of bitter almonds, used for perfuming soap and flavouring pastry."

"Many a fair forehead is damped with the huile de millefleurs, without knowing that its essential ingredient is derived from the drainage of a cow-house."

We trust our fair readers will not feel disgusted with us for letting them into the secrets of our cunning manufacturing chemists, but the truth must be told, come what may. If it were not for his aid, such flavourings and perfumes would not come within the reach of a vast number of persons who enjoy them without knowing that they are only imitations of the real thing.

That valuable material, glycerine, now used for so many purposes, was once a waste article, produced in the manufacture of Price's patent candles from palm oil. It was found necessary to abstract this substance, as it caused an unpleasant smell

when the charred end of the wick went out. When their factory was in full work some years since at Vauxhall, this substance was allowed to flow off into the river, and the estimated loss per week was upwards of £400. This, of course, they have only since ascertained; now that they have been able to eliminate it, and its valuable qualities have been ascertained, well may it be said that the by-products of some manufactures are sufficient to produce the profit.

One of the largest manufactures has of recent years grown out of an article which filled the useful but humble office of rubbing out pencil marks—india-rubber. When this article is vulcanized, that is, treated with sulphur, in order to make it useful for the thousand purposes to which it is applied, for a long time the worn-out articles were considered valueless, as they would not remelt, so as to be mixed with the new gum. This, however, is now accomplished, and the old rubber is now mixed with the new, in certain proportions, the products being equal to pure caoutchouc. The old material was worth £18 per ton, and the new £200 per ton. The utilisation in this case enables the manufacturer to materially reduce the price of the manufactured goods. Old rubber, however, independently of its use for mixing, is capable of being utilised by itself. It is steamed, passed between rollers, and so softened; when in this state, it is applied to a strong coarse fabric, and used to stiffen the heels of boots.

When we are told that the unburnt ends of cigars are picked up and sold for the purpose of making cigarettes, we are mightily struck with the deliberate destruction, not to say waste, that goes on day and night in the London Docks; in the very centre of which, we are informed, is an enormous kiln, which has a long chimney, known popularly as the Queen's tobacco-pipe, for the reason that all forfeited tobacco and cigars, and other articles said to be too bad for sale are consigned to it. We are told that cart-loads of the odoriferous weed are carried to the kiln every day to be consumed. Whilst we conserve cigar ends, this seems like straining at a gnat and swallowing a camel. It is impossible to believe that all this tobacco can be worthless. Even if it were sold for manure, it would be better than turning it into ashes. The maw of this furnace is omnivorous. Tobacco is indeed its chief meal, but every perishable article upon which duty has not been paid is consumed. This certainly is nothing less than disgrace-

ful that good food should be so destroyed, whilst the poor people in the neighbourhood are starving; but this of course we may expect from the cruel mercies of a Government department, which was never known to have bowels of compassion for any one. "On one occasion," says Mr. Simmonds, "nine hundred Australian hams were suffered to remain, anticipating the removal of the duty; when it did come off, the customs would not allow them to be removed, and they were allowed to remain until they were so damaged as to be unsaleable." Nevertheless the attendants upon the oven made merry upon the hams, which were cooked ready for their breakfast. Tea, we are told, is not now burnt, because on one occasion a load set the chimney-stack on fire. One would have thought that a chimney-sweeper would have removed this difficulty; but the ways of officials are inscrutable. But what shall we say to the fact that on one occasion the Queen's pipe smoked away thirteen thousand pairs of damaged French gloves? On another occasion a large number of foreign watches, said to be of gold, were consumed as spurious, broken up and burnt. Surely for the purposes of keeping time, a watch in a sham gold case would be useful, and may have been sold for the benefit of the public revenue; but this was not permitted, but what little gold there was upon them was sold with the ashes, which was disposed of for manure. In France the tobacco refuse is used for manure, and making sheep-wash, and in the other docks in London condemned goods are buried until they are partly rotten, when they are dug up and sold as manure. Possibly some one will find out for the Custom-house authorities some more moderate use than the fields, for the wonderful assortment that Her Majesty consumes in her pipe.

Of old the refuse from the rope-making yard at Chatham was burnt as useless, but lately it was discovered by some clever fellow that it could be used in the manufacture of a coarse brown paper. Why should not all the refuse from the Queen's warehouses be put up to auction? If so, we should speedily find plenty of purchasers, and the hill-women speedily sifting and sorting a far more valuable refuse-heap than is gathered from our dust-bins.

Bookbinders' boards are made in the United States from the refuse of the oakum factories, and from tarred ropes. The ropes are cut into small pieces by machinery, ground into a pulp and made into boards, which are

subjected to hydraulic pressure, and dried by steam pipes, and afterwards calendered.

Those who have visited districts where copper-smelting furnaces are at work, are not likely to forget the scene of desolation in the landscape around. In the Vale of Neath, for instance, and the neighbourhood of Swansea, all animal and vegetable life is extinct. Such a miserable desolation is produced by the fumes, that upwards of twenty thousand acres of land are being absolutely destroyed. Sulphuric acid and arsenic float in the atmosphere and destroy the woods, scathe the grass, and render the whole neighbourhood as desolate as if it surrounded a volcano actively at work. The proprietors of land in the neighbourhood, having commenced an action against the copper miners of England, they have agreed to abate the nuisance. Mr. H. Vivian, of the Hofod Work, has adopted a calcining furnace, invented by Mr. Gerstenpoffer, by which at least two-thirds of the sulphurous acid gas given off in the calcining process are converted into sulphuric acid to the amount of a thousand tons a week, which is employed in making super-phosphates. The arsenic is caught in the roasting-flues and collected. We have no doubt that the success of the experiment will induce the other copper smelters to adopt the like furnace, as it cannot be permitted that manufactories should be a curse to agriculture, merely through the ignorance or carelessness of those conducting them.

The slag, again, from iron-smelting furnaces, encumber the ground in the neighbourhood of foundries to a very large extent. This slag is now produced to the extent of ten million tons a year. Yet this refuse vitreous product is one of the hardest minerals in existence, vastly exceeding granite. When refined from extraneous products, it will cast in moulds. Indeed, it has been utilised to form the coping stones for walls, and for coping stones its hardness and impermeability to water, renders them very valuable for building in damp places. It only requires that this material should be coloured with some bright tint to render it an invaluable material for building, and one which would last for all time.

Another refuse which has hitherto been produced on an enormous scale, is known as soda waste. Vast quantities of this material are cast out by most alkali works, and when we say that the whole of the sulphur employed in making washing soda is removed in chemical combination as a constituent, the amount of the loss to the

manufacturer must be obvious, independently of the nuisance of the heaps to the neighbourhood in which the manufactory happens to be situated, in consequence of the foul gases they give off. Of late years, however, the problem has been solved of recovering the sulphur. This is an important victory for the chemist, inasmuch as a very great nuisance has been turned into a profitable product.

We would now draw the attention of the British farmers to a loss which they sustain to their land in the form of potash. Sheep draw from the pastures in which they graze a considerable quantity of this valuable ingredient of the soil. It was discovered by Chevreul that "suent," a peculiar potash compound, forms no less than one-third of the weight of raw merino wool, whilst it forms fifteen per cent. of ordinary fleeces. The French have utilised this knowledge by extracting the "suent" by immersing the fleeces in cold water, from this the potash is recovered by appropriate treatment. It is said that the wool manufacturers of Rheims, Elbœuf, and Fourmies annually wash the fleeces of 6,750,000 sheep, and the potash, in the form of a carbonate, which these fleeces would yield, if subjected to the same process, would give a value of £80,000. What are our farmers about that they cannot persuade some chemical manufacturer to utilise their "suent?" It would pay them handsomely.

Hitherto we have treated upon the utilisation of waste produced upon a manufacturing scale, but there are very many curious examples in the arts, especially where the precious metals are concerned, in which the greatest care is taken to conserve every particle. Thus in the goldsmith's trade, an old waistcoat will always buy a new one in consequence of the amount of gold dust about it. The leather aprons which are suspended by the working benches are also valuable for the same reason, whilst their sweepings represent pure gold. The same care is taken of the filings and dust of silver-smiths' benches. The old lead mines, near Athens, which were worked by the ancients, have heaps of scoræ around them, which is now being worked for the lead and silver that can be extracted from them. Upwards of nine thousand tons of lead per annum are regained, which contains about ten ounces of silver to the ton. The amount of silver that is recovered from the plating of gold and silver used by the photographers, is something very large. All the washings from the prints

are saved, as are the washings of negatives and the waste developing solutions, old cartes, and waste copies are burnt, and the precious metal is thereby rescued.

But photography has given birth to another form of waste which has also been utilised of late years. The production of albuminised paper consumes a vast number of eggs, of which the whites only are required, consequently the yolks for a considerable time were thrown away. A clever Frenchman some years ago, a maker of "cofichets," those yellow-looking articles of food we meet with in Paris (not knowing whether they are made for man or beast), suddenly secured all the yolks from the principal photographers, and immediately undersold all the manufacturers of his speciality, the reason being that the commodity was principally composed of this portion of the egg. The confectioners, however, soon followed his lead, and cheese-cakes should have fallen in price, but they considered, we suppose, that the laws of demand and supply are only to be taken advantage of by themselves.

The inferior metals being of course used universally, the waste from them is necessarily very great, but efforts are being made year by year to lessen it. Mr. Simmonds tells us that "in the manufacture of tin ware, there is a large waste of the raw material in the shape of clippings and pieces, and as this is a waste of two useful metals, iron and tin, attempts have been made from time to time to reclaim each metal separately, with a view to utilising them. The tin, which demands from its great value the highest consideration, is first separated from the iron by an acid, and afterwards, by charcoal means, restored to the metallic state; but the difficulty has hitherto been to keep the restored tin quite free from iron, the presence of which, though in minute quantities, effectually neutralises the most valuable qualities of the tin." The iron being charcoal iron is valuable, and by means of hammers introduced into the furnace itself, the scraps are welded together and are manufactured into bar-iron in the ordinary way. Whilst it is well to observe that we are careful to conserve the scraps at

home, we must not forget to mention the fact that for seventeen miles along the coast of the province of Taranaki, New Zealand, there is nothing but a dull beach of a dark hue. This beach is at low water fully half a mile in width. It is of a metallic lustre, and looks, we are told, like fine gunpowder. It is indeed nothing less than steel dust, making excellent steel of a fine quality. On analysis it is found to contain 88.45 per cent. of peroxide of iron, 11.43 of oxide of potassium with silica, and only 0.12 of waste. This, we are told, is a specimen of miles of sand round the coast, all bearing a very large per cent. of magnetic iron, none of which has yet been extracted on a manufacturing scale. Whilst we are picking up bits of waste manufactured iron, it would seem as though the bounties of nature, with regard to this metal, were almost boundless in this colony, and in a condition most favourable for manufacture.

We have before noted that horse-shoe nails are collected for the purpose of selling to the manufacturers of rifle-gun barrels, the hammering which they get on the stones making them exceedingly tough in its fibre; but we must not forget the fact that the waste of steel-pen factories goes back to be remade into steel. The same may be said of needle factories, both articles being made of the very best steel. Old slop-pails, tea-trays, shovels, &c., are sent to copper streams, where they gather up the copper which would otherwise run to waste. Where, as in the Government and other factories, iron and brass filings are mixed together, the iron is separated from the brass by rotating magnets, which attract the iron filings. By the same process the steel is extracted from the sand in the fore-shores of New Zealand.

Have we said enough to excite the wonder of our reader with respect to the exploits of our chemists? Our scientific men by no means coincide with this wonder, but consider that we are only on the threshold of discoveries far more extraordinary, which must arise out of those which have been already accomplished.

ANDREW WYNTER.

HIS HONOUR'S BOUNTY.

A True Story.

"SHURE an' did I niver till ye about his honour's bounty? Well, I'll till ye now.

"Me husband was jist dead, an' o' course the new widder, wi' her three boys, was all the talk o' the place. I jist set wi' me back to the world an' me ould pipe i' me mouth, and tilled 'em to let me alone. An' they did jist the day he wer buried; but the nixt a lot came rooshin' in an' callin' oot to me—

"'Biddy,' they says all in a breath, 'there'll be somethin' fine for ye now and the daer boys. Lord H—— has sint for ye.'

"I led howld o' the big sarsepin, and fild ivery bit inclined for to break one o' their heads wi' it, jist to distract me grafe. But thin I thought, is it mesilf wi' the three orphins as shouldn't be coomfitted to hear his honour's sint for me.

"So I jist cleared 'em all oot o' the place, and washed and dressed us all up beautiful. My ildist was jist raching twelve; and three finer boys niver brought tares to a mother's eye.

"I put 'em on the best I had, an' it's beautiful my ildist looked, I can till ye. I'd polished his boots like jet wi' these hands as 'ud a worked to the bone to do his father's mim'ry the laste honour in life. Ah, an' the boy jist did look illigant, too, in his grey ribbed stockin's o' me own knittin', an' his hair brooshed up so prood, an' his father's best coat tied round him aisy, be the slaves.

"I made the best o' mesilf, too, wi' me nate bonnet, an' a cap inside o' it, white as snow, an' a fine black shawl wi' crape a quater yard dape. I till ye I look like a noo four-pinny bit jist dropped out o' the mint.

"Ye should a heard 'em whin oot I marched, sindin' the two yoongest afore me, an' howldin' the ildist be the shouldher.

"'Shure, thin, Biddy,' they says, 'ye'll niver goo like that! His honour 'll niver belave ye're in want, if ye goo like that. Look at her shawl! Look at the childher! Why, Biddy, ye're jist mad. Ye'll niver git a pinny o' his lor'ship.'

"An' I says to 'em, 'Let me alone. I'll goo to the best o' the circumstances as me husband's lift me in; an' if his honour 'll not gi' me anything for bein' respectible, he'll niver gi' me anything for bein' in rags.'

"Whin we got to the town I was towld as Lord H—— was a setting wi' the boord o'

guardians in the big town hall, an' I was to goo up to him there.

"'Oh, thank ye,' says I; 'an' I can wait his honour's lasure.'

"'Oh, but it's there he wants to see ye,' says they.

"I had me own thoughts, but I said niver another word, but took up the childher to the town hall.

"Whin I stood there wi' 'em fore the boord o' guardians, I thinks to mesilf, 'What-iver's the use o' hanging poor murtherers, an' the like? Shure and ain't it the dith of 'em to be brought up like this, if a court o' justice is anything like a boord o' guardians.'

"I stood an' thrimble like a lafe. I says to mesilf, 'Is it disgracin' of his blisshed mim'ry I am, to stand here and be stared at as if I was the thafe o' the world?'

"Thin I took to coomfortin' mesilf wi' sayin' 'Hoot! hould up yer head like the widder of a dacent man, as nather come here as a thafe nor a beggar.'

"At last one o' the gintlemin says to me something about what had I come up to the boord o' guardians for. For the minute, if ye'll belave me, I could no more find me tongue than if the crature wasn't i' me mouth at all, at all.

"As soon as I could spake, I says, 'I come because his honour, Lord H——, sint for me. Will yer honours kindly till me which o' yer honours is his lor'ship?'

"An' he wasn't very far off on'y jist handy where I was standin', an' says he—

"'Yes, I did send for you, Biddy, when I heard of your loss.'

"'God bless yer honour,' I says, 'for that same attintion to me husband's widder.'

"'Well, Biddy,' says he, 'an' now tell me what it is you stand most in need of.'

"'The grace o' God, yer honour,' I says, 'that's what I stand most in need of.'

"An' didn't I spake the thruth? I wasn't going ducky here and scrapin' there and whining, 'Plaze yer honours, I'm a poor widdy woman as 'll be thankful for anything for me poor starved orphins.' Thrue for ye, not I!

"So his honour gives a pleasant smile round to the other gintlemin, and thin he says—

"'An' what besides, Biddy?'

"An' I says, 'Whoiver has that wants little besides, yer honour.'

"Some gentleman says sharp to me—

"Thin what are you here for, Biddy?"

"An' I says, 'His honour sint for me.'

"'Yes,' he says, 'an' so I did, Biddy; an' now let's come to the point. What can be done for you?"

"Thurth, yer honour,' says I, 'far be it from me to take the liberty of advisin' your honour.'

"Thin he turns to the gentlemin beside him an' says a word or two, an' thin turns round to me an' says—

"Well, the fact is, Biddy, I knew your husband well, and knowing how all your circumstances are, I have agreed with the board that you shall be relieved of all expenses for a month. You and your children shall go into the house for that time.'

"I couldn't look at him, an' I couldn't spake. I laid hould o' the daer boy's shouldher, an' me eyes swimm'd, an' all the room looked like a big pudd'in', wi' guardians' faces for the plums. I laid hould o' the daer boy wi' both hands, an' spake I couldn't. At last Lord H—— says—

"Well, Biddy, will that do?"

"I *had* to spake thin, an' I can tell ye I've fitched up many a bucket o' water from a dape well asier than I fitched up ivery word jist thin. For whin I come round a bit I remimbered whin I was a geril seein' how the poor childher an' wives, an' kindhred come to say ther friends for a minit or two at the outside door o' the workus, bringin' bits o' thrates for 'em, an, thin' goin' away agin', an, indade it brought the tares to me eyes agin, jist to think of it, it ded.

"Yer honour,' I says, 'I'm much obliged to ye for yer kindness, an' I'm graved to deny ye any favour ye may ask me, but I promised me husband on his dyin' bed as I'd niver desart his childher till they was ould enough to earn their own livin', an' be the grace o' God I niver will. So, wi' all thanks to yer honour, I can't go into the house; for lose sight o' these childher, while they is childher, I won't, not a day, yer honour—no, not an hour!'

"I laned on the child, thrimblin' an' pantin', but I *could* spake now, an' look 'em in the face too. Ah, an' wasn't I plazed whin his lordship thumps his fist down on the table, an' says he—

"Upon my honour, gentlemin,' says he, 'this little Irish widder is a cridit to her country. The board,' says he, 'will sure do such spirit justice, for it's rare indade to mate wi' it.'

"An' he spakes a bit wi' one or two o' the

gentlemin, and thin turns round to me an' says—

"Biddy, the board will allow you two shillings a week for two months, an' longer, if you should require it.'

"I thank yer honour,' I says; 'but, begging yer honour's pardon, I must decline to accept the board's kindness.'

"But now really, Biddy, says he, 'ain't ye rather onreasonable? If ye don't want help, why did ye come?"

"I looked up at him, and says I, 'Yer honour sint for me.'

"Yes,' he says, 'I did; for any good that I might be able to do you here, Biddy, I wished to do for your husband's sake.'

"Thin says I, 'I thank yer honour for that same wish; but, if I may make bould to spake, I should wish, wi'oot disrispict to the gentlemin o' the board o' guardians, to remind yer honour as there's some differince between a poor widder, wi' her 'fiction still hivvy on her heart, bein' sint for be a private gentleman as knowed her husband, an' was graved for her loss; there's a differince, yer honour, between that an' bein' called on to appear in public whin her wades is on her for the first time, an' she'd rayther hide her head from iv'ry eye. Yit, yer honour,' I says, 'as I *am* here, figgerin, widder as I am—like a stage-player, or a pauper, or a thafe—let me till ye, wi' all respect to the gentlemin o' the board o' guardians an' yer lorship, help from the parish is jist the last thing I can take, be rasons I will till ye. Whin me husband met me an' married me, yer honour, I had nayther dacent birth nor beauty, money nor manners. He was not the like of yer honour, but he was a gentleman compared wi' me. His ways was abooove me, an' I could niver, thry as I would, plaze him wi' nothing. Yet he was the best husband as iver lived to me; an' many's the time, yer honour, as I've prayed to the Lord an' the blessed Vargin that the day might come whin I might find some way for me hands to do me heart's wish, an' that's to work wi' all me might for him. But I niver could. I was jist the roughest o' the rough; it was all trying an' pullin' the wrong way, from the first to the last. But now, yer honours, me chance is come, an' though it's come the cruelest way it could come, I'm goin' to use it, and not to grave. I couldn't work as he wanted; that's to make meself up to his mark and bring the childher up to it. I couldn't work for rispictibility; but, yer honour, I *can* work for bread, I *can* fade his childher, I can keep 'em indepindint o' every one but

their own poor widdered mother, an' I will. No boord o' guardians (savin' yer presence) shall come between me an' that wilcome work.'

"An' whin I had said me say—fool that I was—I wint an' busted out a roarin'.

"What d'ye think as his lor'ship done? Down comes his fist on the table agin, an' says he—

"'Upon me honour,' says he, 'I niver see sich a case come before a board o' guardians. Upon me honour,' says he, 'Bridget O'Riley, I will give you two shillin's a week out o' me own pocket as long as I live!'

"An' to the last day of his life he did it. Ah, an' ain't it kept me head above water whin many a time I must gone to the bottom o' trouble but for his honour's boonty. For eighteen years it was sint me rig'lar to the quarter-day. Thin his honour died, an' though me childher was growed up and married, I filt the diffrence, I can till ye. I got me livin' for four years after that by fieldwork, and sellin' apples an' things in the strate; but it was livin' i' the frown o' the world.

"I have one more thing to till ye, not about his honour's silf, but as ought to be tould, as it's jist so much light to his mimery.

"One day I'd been a tillin' Father Malone all as I've jist tilled ye, an' he says to me—

"'Biddy, does the prisent Lord H— know this?' says he.

"'Ah, yer riv'rince, it matters little,' says I, 'whither he knows it or not. Noo lords ain't like ould lords.'

"But all the same, Father Malone bein' a silf-willed kind o' gntleman, 'sisted on my 'plyin' in the same way for me 'lowance. I laughed i' me slave at mesilf whin I wint to the ould place jist to satisfy his riv'rince.

"Ah, but he had the laugh o' his side, did Father Malone, whin one night I come bustin' in to him wi' a letter in me hand and me quarter's money, an' a promise from the noo lord as I was to have it while I live.

"'There, Biddy,' says his riv'rince, 'you see new lords may be as good as ould. I thought,' says he, 'that there wasn't an end yet of his honour's bounty.'

KATHERINE SAUNDERS.

MY BROAD DOMAINS.

THE fair domains of Art are infinite.

Beyond the golden shining of the sun

Through realms supernal, yielding new delight,

From universe to universe they run.

All is not gathered Beauty has to give,

Still Proteus works with his transforming power,

Imagination doth for ever live,

And there are charms unsung in every flower.

Thus feel I, as some wide-resounding lay

I con by an immortal master wrought,

When sauntering down a long-forgotten way

Enriched by jewels which no eye has caught,—

I hear strange melodies the bright air ringing

Which long have waited for some poet's singing.

EDWARD CAPERN.

READERS AND READING.

By THE "JOURNEYMAN ENGINEER."

IT is a point not to be disputed that the working classes, as a body, are badly educated, whether in the stricter or wider sense of the term. At the same time, however, it is safe to assert that the great bulk of them can read. With considerable numbers the capability is barely mechanical, and from being rarely used, can only be used at all with great difficulty, should a necessity for exercising it arise; but the majority do read—some of them a great deal. If, therefore, the potentially educative power of reading and the state of education actually existing among the working classes are considered in relation to each other, it will naturally be concluded that the reading of the classes in question is of a low, non-instructive, non-refining character—and such, to a great extent, is really the case. The literature which is more especially addressed to or supported by the working-class readers, and which forms the sole reading of the majority, is of the non- or mis-educating type. It is not at all a kind of reading that "maketh a full man," but a kind of which the best that can be said or hoped is, that it finds its readers empty, and leaves them so.

Let us, however, look first at the brighter side of the picture—for it has a brighter side. The modern army of general readers embraces a considerable number of working men within its ranks; men who, solely from being general readers, stand out from the mass of their fellows as markedly intelligent and well-informed; men, moreover, who have about them that indescribable, but at the same time unmistakable air of superiority and power which knowledge gives. These are the men who are to be found in the reading and conversation rooms of mechanics' and literary institutions, and the better class of working-men's clubs, who avail themselves of the opportunities for intellectual improvement and rational pleasure, afforded by free and other easily—that is, cheaply—accessible public libraries, and who, in these days of cheap standard literature, have generally their own little but well-selected home library. A mechanics' institution—a veritable mechanics' institution that is—an institution attached to some large manufacturing establishment, and used exclusively by the "hands" employed in the works, is perhaps the best scene that could be selected for a study of the reading set

among the working classes. Such institutions are for the most part mainly supported by the employers, the weekly or other periodical subscriptions of the members being little more than nominal. For this reason, and because it is taken for granted that firms who go to the trouble and expense of establishing such institutions would like their hands to join them, a good number belong to them; but those who use them to any considerable extent are a but too small percentage of the whole, are the reading set. In the reading-room of the institution they keep themselves posted in current criticism on leading questions of the day, as it is to be found in the pages of such publications as the *Quarterly*, *Edinburgh*, and *Fortnightly Reviews*; *Fraser's* and *Blackwood's Magazines*; the *Saturday Review*, *Spectator*, the *Times*, and *Pall Mall Gazette*. These they read as a means of getting a broad, general, both-sided view of questions that may be agitating public opinion for the time being; and having read, marked, learned, and inwardly digested the criticisms in the reading-room, they will in the conversation-room discuss the subjects to which the criticisms relate, together with the relative merits or impartiality of the criticisms themselves. Many a pleasant and profitable hour have I spent in such a conversation-room, listening to or taking part in friendly-conducted but vigorously-contested debates on such questions as the Darwinian theory of descent, the morality of Jesuitism, the true method of history, the practical possibilities of the co-operative principle, Professor Tyndall's Belfast speech, Mr. Gladstone's Vatican Decrees "expostulation"—questions which, though as familiar as household words in educated and reading circles, and popularly supposed to be "in everybody's mouth," will still be found to be "caviare to the general," so far as the mass of the working classes are concerned. I have mentioned these "heavier" subjects, but they are not the only kind that will be discussed when a number of the reading men find themselves together and in the vein for conversation. They will go from grave to gay, from lively to severe—from, say, the limits of scientific investigation to a "good thing" in the comic papers or a witty saying of some public man; from the account of a "roars of laughter" exciting breach of

promise trial to the cutting up administered to some vapid novel in a "slashing" article in the *Saturday Review*, or the trenchant satire of the *Pall Mall Gazette* anent some passing example of social hypocrisy or bigotry. And from such modern instances as these, by an easy and natural transition—to men who have a present-day general reader's stock of information to draw upon—to comparisons with the slashing reviewers and trenchant satirists of a past day. With what I once heard a shopmate describe as Macaulay's "skin-'em-alive-o" criticism, as exemplified in his reviews of "Mr. Robert Montgomery's Poems," Crocker's edition of "Boswell's Life of Johnson," Dr. Nare's "Burleigh and his Times," and the "Mémoires de Bertrand Barère," or Swift's trenchant satire in Gulliver and the Directions to Servants.

The reading of the current newspapers and periodicals is of necessity carried on in the reading-rooms of institutions; but the reading of books, the more standard reading, is for the most part home-work—a labour of love in which each man indulges by his ain fireside. As a rule one of the pleasantest pictures to be found within the whole range of the inner life of the working-classes, is the winter evening at home of a working-class family, the head of which is a reading man. He is generally a man of some taste and refinement, who has found for himself a partner in life who shares those feelings. He is steady, and therefore pretty sure of constant work. Reading affords him an intellectual pleasure that is a safeguard to him against less rational, less healthy, and more costly (so-called) pleasures, so that his earnings can be devoted in their entirety to the comfort of his home, his family, and himself. He cannot, it is true, have a study to himself, nor does he want one, any attempt to set up one would be affectation upon his part. His living room is orderly, and bright, and cheerful. When he has washed, finished tea, donned his loose house-coat, and easy slippers, he can sit himself down, book in hand, sure of a pleasant evening. He is a sufficiently earnest reader to be able to so concentrate his attention upon his book, that a little conversation between his wife, and say a daughter who is helping her with her needlework, will not distract him, or make him irritable. At the same time he must not be a selfish, that is, an altogether silent reader, nor is he. As he comes upon them he will read to the others some glowing passage of history, some thrilling piece of

poetry, some wise or tender saying, some pathetic episode from a biography, or incident from fiction. Sometimes, indeed, a man will in a course of evening readings, read right through a book to his family, and in this way some of them acquire the rather rare accomplishment of reading well aloud. Sometimes it will happen that a friend or two, of his own inclining in the matter of reading, will drop in to see the man who is spending his evening at home, and in that case the reading usually gives way to a "Friends in Council" sort of discourse upon things in general, the wife occasionally joining in with some shrewd womanly remark.

In these days of novel reading, the better class of fiction, as might naturally be expected, takes a prominent place in the reading of the reading men. The works and heroes of Scott, Thackeray, Dickens, George Elliot, and Miss Muloch are familiar to them. They admire the true nobility and gentlemanhood of Colonel Newcome and John Halifax, can appreciate the wonderful art and power displayed in the delineation of the great "Waverley" gallery of historic portraits, understand and feel the mingled humour and pathos of such a creation as little Paul Dombey, and do homage to the wonderful power exhibited in the portrayal of the Tito of Romola, and the Hetty Sorrel and Mrs. Poyser of "Adam Bede." Poetry, too, is pretty extensively read, and history is a popular subject, the latter-day historians of the picturesque school, headed by Macaulay and Froude, being the favourite authors. Biography is another branch of reading that has great attractions, lives of eminent literary men, and of men of the self-help order being the most run upon.

The argument sometimes put forth to the effect that the present easy accessibility to the whole range of general literature makes the general reader a person of very superficial knowledge, of course applies to working-class as well as other readers. As a matter of fact there is something in it, but whether or to what degree that something is in the nature of an evil, is scarcely worth while inquiring here; since if it be an evil at all it is but a slight one. The reading man of to-day, if more widely, is probably less thoroughly informed as regards a given subject, than the reading man of twenty or five-and-twenty years ago would have been. At present a working man with a taste for reading will in the course of a week glance through a score of papers—not to speak of periodicals—lying on the tables of the "Institution" to which

he belongs, while in the days when literary institutions of any kind were much more few and far between than is the case now, and the penny daily press was as yet among the things to be, he would probably have had to be content with a single weekly paper, for which he would have to pay treble the amount of his weekly subscription to a modern institution. Books were proportionately dear and difficult of access, and a working man's reading being from these causes limited in extent, was, within its range, more thorough than it would have been had the range been wider. For instance, the poetry of Eliza Cook has no warmer or more appreciative admirers than the intelligent and reading section of the working-classes. When her pieces were appearing in the *Weekly Dispatch*, at that time a sixpenny paper, numbers of working men took it in for the sake of her writings, which they read and re-read until they knew the poems by heart, and "The Old Arm Chair," "The Englishman," "The Poor Man's Grave," "The Heart's Charity," and other favourite pieces would in the workshop be recited by reading for the benefit of non-reading men. For the same reason *Eliza Cook's Journal* was in its day a great favourite with working men, and while, as has just been mentioned, the poetry was often got off by heart, the general contents of the paper or journal were also well digested. Nowadays, however, so many fresh fields and pastures new have been opened up in literature, and more particularly of newspaper and periodical literature, that the general reader can no longer be as thorough as of old. If he would keep pace with the times, he can no longer afford time to get a favourite poet off by heart. But he can acquire a knowledge of the general style and scope of an author, and a conception and remembrance of his individual creations or opinions, and when to this is added the advantage—as is usually the case—of being in a situation to at any time obtain a reading of the author's works, the position, intellectually considered, is, upon the whole, a tolerably satisfactory one. If the general reader of to-day has lost anything in point of thoroughness, I think it may safely be said that he has gained to a fully compensating degree in extent and variety. The working man who has a taste for it, has in reading not only a means to self-education, and the knowledge which is power, but also a high and legitimate source of pleasure—a pleasure that places him above the man that has

not acquired such a taste, and that tends to make him contented and happy. He has now ample opportunity for gratifying his taste, not only in the matter of obtaining books, but also in the scarcely less important matter of time to read them. Working men have now a very fair amount of leisure at their disposal, and if of that inclining, can get through a goodly quantity of reading, the possibilities on this head being best shown by the wide range of reading that some of them have gone through—a range taking in the best works in nearly every branch of general literature; theology, history, biography, criticism, the standard essayists, dramatists, and novelists, politics, voyages, and travels, and popular science. And while, on the one hand, working men have sufficient time at their own disposal to enable them to make themselves well-read, well-informed members of society, on the other hand the environments of their daily life are such that there can be no danger of their reading causing them to degenerate into mere bookworms, or making them dreamy or impracticable, when called upon to encounter the "stern realities" of life.

Branching, so to speak, from the general reader is the student reader; the man who "goes in" for some particular study or science, setting himself to acquire not only a general, but a special knowledge of it. Here again the range is wide. Numbers, as might naturally be expected, devote themselves to subjects a practical and technical acquaintance with which is calculated to be of service to them in their capacity of skilled workmen. Mathematics, metallurgy, and chemistry are the chief subjects taken up in this connection, though others, such as acoustics, light, heat, and electricity, are also studied. The institution throughout the country of science classes, in connection with the government Science and Art department, has done much to promote and encourage study in this direction, as has also the founding of such scholarships as the Whitworth, and those connected with the School of Mines. Altogether on this head it may be said that out-look is hopeful. There are reasonable grounds for believing that large numbers of the rising generation of artisans will acquire for themselves that technical education which is now admitted on all hands to be one of the things absolutely needful if England's craftsmen are to continue to maintain their proud position as the best in the world. As in many branches of manufacturing industry, English artisan talent

commands large pay in continental countries, modern languages are studied partly with a view to the practical advantages that may be derived from their acquirement, partly for the intellectual gratification of being able to read their literary masterpieces in the original. Of the sciences studied for "the pure love of the thing," geology is nowadays the most popular, botany and zoology coming next. Among the students of theology, too, numbers of working men are to be ranked, some of them being lay preachers of various dissenting bodies.

Finally, in speaking of the reading set among the working classes, it may be mentioned that original literary composition is by no means unknown among them. Some of them are "occasional contributors" to local newspapers, and even to publications having a much greater than local circulation. As one of themselves too, I have often been privileged to see manuscript themes both in prose and verse, which though they had never attained the dignity of type, were as worthy of the honour as a good deal that I have seen in print. And as I have known some of the reading set to write well, so, in debating and mutual improvement societies, in workshop meetings, and on public platforms, I have heard others of them speaking well, having something worth saying to say, and saying it well, and showing both in the method and manner of their speech not only that they were naturally intelligent, but also well-read, and in that sense well-educated persons.

To compare is to contrast, and strongly, the reading and non-reading portions of the working classes; and, thoughtfully considered, the contrast is a sorrowful one, the more especially as the latter portion are by far the most numerous. Contrasted with the reading, the non-reading working man may, figuratively speaking, be said to belong to a less advanced period of human history. For him, so to speak, the world is not so wide, so varied, so pleasant as for the other. The treasures contained in books are buried treasures to him, not so much, in the majority of instances, because he has not the key to them, as because he has not come to understand their inestimable value. He has no acquaintance with "the great of old;" they do *not* rule *his* spirit from their urns. He knows nothing of their noble and ennobling creations. To him knowledge her ample page, rich with the spoils of time, has ne'er unrolled, simply because he has allowed her pages to remain sealed ones to him. He

is ignorant of his country and history and of the story of the lives of those whose lives are landmarks in that history; of those who have greatly done, and dared, and suffered. The martyrs, the discoverers, the inventors, the orators who have swayed the councils of a nation or the hearts of a people, the great men who have at once stepped to the forefront, when the great times that have called for such men have come about, the statesmen and soldiers whose names and fame live after them. While he thus lacks knowledge, he is also incapable of entering into the higher intellectual pleasures, and therefore the more readily falls into pleasures (?) which, unintellectual in the beginning, often become vicious in the end. He is the inferior of the educated and informed, and feels himself to be so. Great as is the gulf between rich and poor, it is neither so wide nor impassable—so far as moral feeling is concerned—as the gulf between knowledge and ignorance. A reading and well-read working man can and *docs*—speaking in a general way—feel himself equal to any man. He has at command intellectual pleasures which riches alone could not procure him, and he is the conscious superior of any man, however wealthy, who lacks the capacity or taste for those higher and purer pleasures that are to be derived from reading. But the ignorant, unread, uncultivated working man cannot have such a feeling; he is the inferior of the educated of all classes, including his own.

The non-readers may be divided into three types. First come those who are utterly unable to read at all, still a lamentably large number, but happily a constantly diminishing proportion of the working classes at large. They are a dismal type to contemplate. They are so ignorant as to be incapable of realising the extent and intensity of their own ignorance, or the greatness and many-sidedness of their loss. Much of life is necessarily a blank to them, and, debarred from intellectual pleasures, it is no wonder that drunkenness and other vices should abound among them. The second type consists of those who can read, but very seldom do. They have had the advantage of schooling, and, as children, may have been able to read fluently, but from disuse the power has become impaired. As men they read, not fluently or with ease to themselves, but more or less lamely, and with effort. Many of them can just manage to hobble their way through a poster, or the letter-press of the titles to the illustrations to the *Illustrated Police News*, and other such delectable pub-

lications, while others confine their literary exercises to laboriously wading their way through the criminal records of the cheap weekly newspapers. The third type are only non-readers in the sense that they do not read anything worthy of the name of literature—anything from which they can gain either knowledge or taste. They do read, but not books, not what is ordinarily understood as periodicals, but penny weekly journals and “numbers,” which, as I have just hinted, cannot by any permissible extension of the term be classed as literature, and which it is certainly no libel to class as trash. These publications consist of “To-be-continued-in-our-next” stories of the most outrageously absurd character. The central line on which they are all constructed is the picturing of what the readers of such rubbish fondly take to be the social and inner life of the aristocracy.

Princes and princesses, dukes and duchesses, lords and ladies—both home and foreign—stalk through their pages, not certainly as “things of life,” but as horrid examples of the abortive images that *can* be evolved from the inner consciousness of the sensational novelists of the lower grade when pandering to a foolish taste, and writing without the fear of criticism before their eyes. Magnificent ancestral “seats” and estates figure as prominently and frequently as titled personages. The halls of dazzling light are a stock property, and money, jewels, and gorgeous dress and furniture are scattered about with an Arabian-Nights-like lavishness. The stolen heir, the children changed at nurse, the abducted heiress, the secret drawer and lost will, the scientific poisoner, the hired bravo, the broad-shouldered, black-bearded ha! ha-ing villain who has a “hold” upon the equally villainous but less robust and more aristocratic personage who is in possession of “the ancestral estate”—all these and other creatures who are popularly supposed to have died with the old form of melodrama, are in these tales made to walk again. All is glare and glitter; tall talk, false life, false sentiment, false morality. These publications are supported almost exclusively by the working classes, who buy them by tens and hundreds of thousands. They form the chief reading of the women and girls of those classes, and it is probably to suit this portion of their clients that the authors of the tales throw in the character of “the poor but virtuous maiden,” who commences life as a milliner and rises to be a marchioness. Females form a majority of

the readers, but the number of male readers is very large, and this is the most wonderful part of the business. That grown and bearded men who can read, and who for the most part have a world before them where to choose in the matter of reading, should be found giving themselves up to the exclusive reading of such worthless, contemptible, enervating trash, is really surprising; but so it is, and pity 'tis, 'tis so.

But undesirable as are the above class of serials as the reading of a people, they may be regarded as highly commendable compared with the style of publications known as “Penny Dreadfuls.” Their character is sufficiently indicated in their titles—“Jack Sheppard,” “Black Bess, or the Knights of the Road,” “Tyburn Tree,” “Sixteen-String Jack,” “The Boy Highwayman,” “The Boy Pirate,” “Claude Duval,” and the like. Their avowed purpose is to heroize crime, and especially youthful crime. Their direct teaching is, that not honesty, but dishonesty, is the best policy; that to live by crime is better, more noble, more *dashing*, than to live by honest labour; that dissipation is the one true token of manhood; and your reckless thief the one great hero to be admired and imitated. By contents as well as title they appeal especially to boys, and unhappily they constitute the exclusive reading of very large numbers of our boys. That it should be constantly coming out that boys found guilty of till and other robberies are extensive readers of the Penny Dreadfuls, is but what might be expected, the connection is as natural as the relation between cause and effect. When such cases come before magistrates, it is generally stated that these publications are to be found freely and abundantly displayed in every back street. But back streets are not the only ones in which they are exhibited in shop windows, and the back streets of our large towns, it should be remembered, are those in which the working classes most do congregate—those, consequently, in which the display of these illustrated “Dreadfuls” are calculated to do the most harm.

The spread of Penny Dreadful literature has undoubtedly wrought a change for the worse among the boys of the working classes, so far as their taste in reading is concerned. Thousands of boys may now be found who read works of “The Boy Highwayman” type by the score, but who have *not* read any such books as “The Pilgrim's Progress,” “Robinson Crusoe,” “The Arabian Nights,” “Cook's Voyages,” “Bruce's Travels,”

"Peter Simple," or "The Last of the Mohicans"—books that were wont to be favourites with working-class boys when copies of them were harder to come by than would now be the case. When, however, such books as these were the popular favourites, the "Penny Dreadful" style of publication, though not unknown, was nothing like the rampant and wide-spread evil it has since become.

There is no law to prohibit the publication of such pernicious trash, and it may very safely be taken for granted that there is no "moral sense" in its authors to which appeal can be made. If it is to be extinguished, it must be conquered in open fight. Literature having its attractiveness of abundant incident and adventure, but inculcating the moral, not that to be a criminal is to be a hero, but that "the good alone are great;" that it is the noble of mind, the brave of heart and deed, the self-sacrificing, and those who, fearless in honesty and integrity, can look the whole world in the face, who are to be admired and emulated—literature of this kind must be made as easily accessible to boys as are the Dreadfuls, if the latter are to be beaten out of the field. And how, it may be asked, is this to be done? To which I would answer, that it *could* in a great measure be accomplished by the establishment of suitable libraries in connection with our public elementary schools; and I may add, that to intelligent working men taking an interest in the educational question, it is matter for astonishment that the School Boards, who have done so much in other respects, have as yet done nothing in this. The value of such an institution must, I think, be self-evident. A school library, consisting of the masterpieces of Bunyan and Defoe, biographies of the "Self Help" order, stories of voyages and travels, and selected works of Walter Scott, Captain Marryat, and Fenimore Cooper, would work an incalculable amount of good. It might be objected by some that a library consisting exclusively of such books would be too light; but we must consider how things stand in the case. All experience proves that boys will have exciting literature. They love to read the stories of those who have done and dared, or those

who have battled with and conquered adverse circumstances—the "men who have risen." They delight in records of hair-breadth scapes, and moving accidents by flood and field, whether in real or imaginary life. Such is the only reading they will go to voluntarily, and with pleasure, and if they cannot get it in its better forms, they will take it in its worst.

To create and direct a taste for reading should be a chief aim of working-class education, and to this end school libraries would be the most effective of all instruments. The real education of a working man—the education that informs his mind, or enables him to master the principles of a science—must in a great measure be self-education, and here reading is the one great means. It opens the gateway to all knowledge, makes it potentially possible for a man to become informed or learned to almost any extent or degree. The importance of the creation of a sound taste for reading among the working classes generally cannot be overrated, and such a taste formed in the boy would, by a process of natural selection, extend and discipline itself in the man. School libraries would have peculiar advantages from the formative point of view, but they are, of course, not the only means of affording the working classes opportunities for good and self-improving reading. A good deal may yet be done in the way of the spread of free libraries, working men's clubs, and similar institutions, though at the same time it has to be borne in mind that the working classes, as a body, have not availed themselves of such of those institutions as have hitherto been established, to anything like the extent they might and ought to have done. Had they done so, a well-read, well-informed, and therefore practically well-educated working man would not be the comparatively exceptional being he now is. There are not, however, wanting signs of a disposition to improvement in this respect, and it is to be hoped that the time is not very far distant when the existing contrast in this matter will have ceased to be; when to be educated, and capable of enjoying intellectual pleasures will be the rule, not the exception, among working men.

"IN THE SNOW-DRIFT."

IN THE SNOW-DRIFT.

AS I tuned my pipes at the turn o' the wood,
 A hare started up, ran a bit, and then stood
 For a moment, and leered at me there !
 Oh, why did I not turn me back at the sight
 Of the warning wraith in the dim moonlight
 And the dancing frosty air—
 (Oh, doggie, 'tis nigh over now,—
 The cold creeps up on my brow !)

Come near me, good dog, creep close to my breast ;
 You might bring me some help,—nought now could arrest
 The dull cold pain gnawing here.
 I would fain touch the pipes just for once again ;
 I could play now, I feel, a far sweeter strain
 Than e'er filled the dancer's ear !
 (Oh, doggie, 'tis nigh over now,—
 The cold creeps up on my brow !)

'Twas strange that the thoughts of old times drew me on,
 Like a call from some old mossy witches' stone,
 And led me to Eachan's door ;
 I couldn't draw back though I knew there was ill
 In the sky and the air, which was heated and still,
 Though the winter was only half o'er.
 (Good doggie, come near me now,
 I may still feel your breath on my brow !)

There were all the bride's friends, and strangers galore ;
 Old Eachan himself was right keen for a splore,
 And offered me dram o' the best ;—
 How it went in my blood : the pipes seemed to know
 'Twas the last of their master's breath he would blow
 Before sinking down into rest !
 (Old doggie, keep near me now !
 Your tongue's like a hand on my brow !)

And the bride, like a vision to eyes grown dim,
 With her brow so white, and her middle so slim,
 Made my old blood dance again :
 For her own mother's picture she was, at the time
 When I was a young one all in my prime,
 And dreamt na my love was in vain.
 (Come near me, good dog, come near,—
 Though there's nothing for me to fear !)

Old Eachan he won her—he ne'er knew my plight,
 And for long I took care to be out of their sight
 At the kirk, or e'en at the fair ;
 Till I heard she had died when her baby was born,
 And then was an end of my anger and scorn,
 And also an end of my care !
 (Oh, doggie, 'tis all done now,—
 The cold creeps over my brow !)

I see all the Sound, though my old eyes are shut,
 And the dogs all a-crouching around the hut,
 As in summer-days by-gone !
 How I played *the* strathspey at the last,—I'm sure
 They felt even like spirits on that clay floor,—
 And I die here all alone,—
 God, listen to my moan !
 (Good-bye, old dog, we must part ;
 I feel the cold clutch at my heart !)

ALEX. H. JAPP.

LOST AND MISSING.

BY THE RIVERSIDE VISITOR.

AMONG those to whom I was indebted for being put into the "ways" of my district was *Mister* Ben Wilson—more familiarly, though not irreverently, spoken of as Old Tarpaulin, a cognomen bestowed upon him from his habitually wearing one of the stiff tarpaulin hats that formed a stock feature of sailor-costume a generation ago. Among the sea-going folk of the district—or, to speak with strict accuracy, among the wives and families of the sea-going men of the district—Ben was a recognised guide, philosopher, and friend. He had himself followed the sea from ten to forty years of age, and would have continued to do so but for a severe illness, brought on by long exposure in an open boat in which he had escaped from a ship that had foundered in mid-ocean in less than five minutes after he had left her. He and the others in the boat, before they were picked up, suffered such privations as made them envy the fate of those who had gone down with the ship. One of the results, as regarded him, was a lengthened attack of acute rheumatism, which, though it did not literally cripple him, so far affected his limbs as to unfit him for the active duties of a sailor's life. Fortunately for himself, however, this state of affairs did not leave him destitute, as it would inevitably have done many of the same calling. His father—who had also been a sailor—had died when he was five years of age ; but it had been his good hap to have a God-fearing mother, and to sail—until he had reached the years of discretion—under the command of a captain who was an earnest Christian.

By the care and watchfulness of these two he had come scathless through the manifold temptations by which the path of a young sailor was in his early time, even more than in the present, beset. He had never fallen into demoralising and impoverishing

debaucheries, which, under the euphemism of Jack-a-shorcism, it is a fashion to regard with an undeserved and mischievous toleration. As a result of his having always been a sober, steady fellow, and having, moreover, for the last ten years of his seafaring life sailed in the capacity of mate, he had saved a considerable sum of money, and on becoming incapacitated for following his profession, he purchased a fairly-profitable news-agent's business, situated in a part of the district in which he was well known and much respected. His trade was chiefly in the largely-circulating penny dailies and weeklies and least harmful of the illustrated penny journals of fiction. In the more harmful, the "dreadfuls" and criminal-heroising class, he declined to deal, though he could have done so profitably. He would not, he said, have any share in the ruin of souls laid at his door.

At the time I entered the district he had been established in this business about six years, and with a sister (he had never been married), who acted as his housekeeper and general helpmate, was very comfortably situated. He was a prominent member of the leading total abstinence society of the district, and a favourite reader at the weekly entertainments which they got up in the winter months. And a fairly good reader he was too, having the talent—somewhat rare among amateurs—of being able to read rhymed verse well, without falling into a sing-song tone. It was at these meetings that I first saw him ; but it was at his shop that I first made his personal acquaintance.

One dull misty morning in the early part of the month of May I called in to order a number of copies of a local journal containing a report of some proceedings in which I took an interest, and had just delivered my commission, when a little girl came hastily in, and in a rather breathless way exclaimed—

"The *Gazette*, please!"

"It's out just at present," answered Wilson, pulling out his watch as he spoke; "but it will be back in a quarter of an hour; you can have it then."

"Will we be next?" she asked anxiously.

"Yes, you'll be next, my dear," he answered; "you had better wait."

"What *Gazette* is it?" I asked, my curiosity slightly roused.

By way of answer he put his hand inside the sliding window, and turned towards me a card hanging there, on which was written in large letters, "The *Shipping Gazette* lent on hire."

"I should hardly have thought," I said, with a slight smile, "that there would have been any representatives of the mercantile or shipowning interests hereabout."

"Would you mind stepping in and taking a seat?" he said, moving towards a small sitting-room attached to the shop, and glancing at the little girl with a significance which at the moment I did not quite understand.

I followed him into the apartment, where I was briefly introduced to his sister, who immediately retired to take his place in the shop.

"Seeing the turn the talk is taking," he observed, motioning me to a chair, and seating himself in one opposite to it, "I thought we had better get out of ear-shot of the youngster, as some word might have been dropped as would have put her poor little heart in a flutter. You're right as to what you say about the merchant and owning interests—that is to say, the *money* interest; but there is another interest goes to the make-up of the shipping interest—the *life* interest. The interest in the lives that must sink or swim with the ship and cargo, and that, unlike them, are not insured, and that, in fact, money couldn't insure to the full value, for the life's happiness, as well as the support of families, goes down with them. That's the interest we have here, and that brings the *Gazette* into demand."

"Ah, yes, I understand now, and an anxious interest it is too."

"Ay, that it is, sir," he assented emphatically; "only those who have their nearest and dearest on the sea can fully tell *how* anxious. Others may have kindly thoughts and good wishes for those 'that go down to the sea in ships, that do business in great waters,' but there's none watches the weather as wistfully as a sailor's wife, and a capful of wind on land has more terror for them than a

gale would have for those on the open sea. There are a good many sorely fluttered hearts hereabout this very morning—a good many eyes that never closed in sleep last night. There are a couple of large steamers, with crews of about fifty or sixty each, and manned chiefly from this neighbourhood, that according to the 'foreign sailings' would be about making the Channel last night."

"But there has been no stormy weather during the last few days," I said, "at least not on land."

"No, not stormy," he answered, "but worse—foggy. The thick weather on shore here is the tail-end of a seaward fog. I should reckon, partly from my own judgment, and partly from word brought by vessels that came up the river three days back, that for the last forty-eight hours there's been a fog over the entrance to the Channel and across the bay, that the best pair of eyes that ever were set in the head of man wouldn't see half a ship's length through, and the brightest light ever placed in lighthouse couldn't strike through far enough to warn. The women about know this as well as I do, and they know too what a terribly risky matter-of-chance thing it is for a vessel to be making the Channel in such weather, especially as things are managed."

"How as things are managed?" I asked.

"Well, on what I should call the touch-and-go, neck-or-nothing system; the system of a quick run first, and everything else, even the chance of losing the ship and crew, afterwards. Of course, captains are not told that they must dash through fog or snow-drift at all hazards; and if anything went wrong through their doing so, it would be said they had a general instruction against doing so. But at the same time they all know very well that it is those who *do* dash through everything and make fast runs that get commands and keep them. A captain who laid-to in a fog, or crawled along feeling his way by taking soundings, would very soon find himself out of commission, and the result is the go-a-headness that is the cause of far more wrecks than real stress of weather or unavoidable causes."

"In short, you think," I said, "that the *natural* perils of the sea, those that are rightly classed as 'the visitation of God,' are not responsible for so much of the loss of life at sea as are causes arising out of the Mammon worship of man?"

"Just so," he assented, in a quick, emphatic tone, "that is exactly what I do think—that is how the business really stands

in the lump, whatever your Board of Trade inquiries or the like may say to this or that particular shipwreck. Money is more thought of than lives, and where that is so, lives will be lost that might have been saved. Why, look how things stand! If a ship goes to sea, and she and her cargo are fully insured, or over-insured—and there are more go out that way than uninsured or under-insured—it pays owners better to hear of her being wrecked, or never to hear of her at all, than to find her putting back for repairs, and with the cargo perhaps to be taken out and put in again; or than that by laying-to in fogs, or the like, the working expenses of the voyage should be run up, and markets missed for the cargo. A captain who did put back to port for repairs, or lay-to in fogs, would soon get the cold shoulder; and so if their ship happens to get crippled a bit in the beginning of a run, as is often the case, instead of putting back, they just drive on, trusting to good luck, and thinking perhaps that they may almost as well lose life as employment. The consequence, as likely as not, is, that in some gale that she would have lived through easily enough if she had been all taut, she goes down with every soul on board, making wives widows and leaving children fatherless. I spoke just now about Board of Trade inquiries into wrecks, but the most and worst wrecks leave no chance for inquiry. Dead men tell no tales, and the ship is posted 'missing.' I've heard people talk, sir, about this or that word being found written on their hearts. Of course it's only a saying, but if there were such a thing, 'missing' would be found written on many a broken heart hereabout. 'Missing' softens things a bit to the outside public, but the relatives of seamen, however ignorant they may be in a general way, know too well the meaning of *that*—'lost, with all hands.' For them it means a husband, father, and breadwinner gone; a dear one parted from them, to meet no more till the sea gives up her dead. Then there is the uncertainty as to how much or how long the lost may have suffered before the end came—an uncertainty that gives double bitterness to the grief of those that loved them."

"The whole subject of loss of life by shipwreck is a very sad one," I said; "but to come back to the two steamers you spoke of just now as being manned from this neighbourhood, do you think evil has befallen them?"

"I hope not," he answered. "There is nothing about either of them in the papers;

and in their case no news is good news. If all has gone well with them, the first due of them, the *G*—, will be up with this afternoon's tide. Talk about anxious suspense, if you want to see a living picture of it, you go down to the *R*— stairs about flood-tide; the women make that their look-out station."

It was in no feeling of mere idle curiosity that I acted upon this hint. I got down to the stairs about three in the afternoon, by which time whatever of fog there had been on shore had thoroughly lifted, and the sun was shining brightly. The *R*— stairs were a stone flight, at which watermen's boats plied. What might be styled their buttresses extended about three yards on either side, and strongly railed off at the ends, and on the river side formed balconies, so to speak, commanding a view of the river. On the part affording the best position for first catching sight of any upward-bound craft, as it came round the bend which limited the downward view, there was gathered two or three men, and about a dozen women, with perhaps as many children ranging from twelve or thirteen years of age to infants in arms. I knew the object that had brought them there, but even if I had not known it I could have told by their looks that they were labouring under some strong anxiety or excitement. Some of them were deadly pale, while the faces of others were highly flushed, but the eyes of all shone with the feverish brilliancy of highly-wrought feeling, and were movelessly fixed on the one point, save for a moment now and then when they droopingly turned away as it became plain to the gaze that something that had been watched round the bend was *not* the eagerly-looked-for vessel. At first I took my stand on the further balcony, separated from the other watchers by the width of the steps; but the excitement of the scene was contagious, and gradually, and almost unconsciously, I walked round to where the others stood, and before long found myself, in common with them, holding on by the rails, and leaning as far as I could over them, so as to gain the furthest possible inch of view. There was a good number of craft coming up with the tide, and every few minutes there was a low-toned cry of, "Here's *something* coming round!" then, amid dead silence, necks and eyes would be strained, till, as the approaching craft cleared the bend, and was plainly seen not to be the *G*—, the breathing suspended in the excitement of the moment would find vent in a sound that was

half sigh, half groan. How long this might have been going on before I arrived upon the scene, I did not know, but it continued for quite an hour afterwards. By that time it was past flood tide, and the ebb would soon be commencing, and the chances of the *G*— now coming up with that tide were already considerably lessened, and were momentarily waxing smaller. If she came at all it must be very shortly, otherwise there would, taking the best view of the case, be another heart-sickening wait of twelve long hours. Already the intervals between the appearance of upward-bound vessels was growing longer and longer, and the warmth of excitement among the spectators was gradually giving way to the coldness of fear and disappointment. Under the growing sense of hopelessness, even the watch itself had become listless, when the sight of a smoke-cloud rising skyward, just below the bend, again aroused attention, as being an unmistakable indication of the approach of a steamer coming upward. The look-out once more became fixed and eager, but it was fully ten minutes before the approaching craft rounded the bend, and became visible to the strained gaze of the watchers. With her appearance, however, the intolerable suspense was soon brought to an end. She was "spanking along" full steam, and one of the male members of the group had scarcely observed, "I do believe *this* is her; it's her build, anyway—a double-funnelled screw," when another added, "Yes, and her colours too; I can make them out now—yellow and black painted funnels." A moment's silence followed, and then the first speaker, in the tone of a man who had only paused to make assurance doubly sure, exclaimed—

"Right you are, Phil, it *is* the *G*—, all right and tight, thank God!"

The "thank God" was heartily echoed by the women, the eyes of some of whom were now dim with tears. The excitement of the watchers was now the excitement of joy. As the ship came ploughing on there were guesses, or imagined recognitions, of the individuals seen moving about her decks, and as she passed the steps there was holding up of babies and waving of handkerchiefs, the latter form of salute being answered in kind from the ship. The anxious watching and waiting had been rewarded, and as the *G*— steamed out of sight dockwards, the watchers turned their steps homewards to prepare to welcome those near and dear on their coming home once more scathless through all the dangers of the deep.

Here I may mention that the other ship which Wilson had spoken of as being in great part manned from our district, came into dock by the following tide, but the shipping intelligence which announced the arrival of these two ships contained accounts of several wrecks that had occurred in the fog that they had come through safely, and later papers gave news of still other wrecks, the total number of lives lost in the various disasters amounting to a total of close upon a hundred, and two of this number, as I afterwards knew, were men from my district, each of whom left a widow and children to lament and suffer by his loss.

Here, too, as being "in the connection" in which I am speaking, I may describe another watch scene of which I chanced to be a witness some years later, when I was much better acquainted with the sea-going folk of my district, and their ways. It was not a watch commenced in the same fearful spirit as that in which I had taken part at the *R*— stairs. It was supposed to be a mere watch of welcome and greeting, and was regarded by those keeping it as rather in the nature of a pleasant little outing. But while the watch beginning in fear had ended in joy, the one commencing joyously was destined to end tragically in sorrow and despair. The *H*—, the ship expected on this occasion, was one of a line belonging to a company that kept its own fleet in repair, and its workshops being situated in my district, most of those constituting the more permanent portions of its ships' crews—captains, mates, engineers, firemen, and the like—also had their homes in the district. The *H*— was upon a regular run that took her a month out and home; and letters from members of her crew, naming the day and hour when she would leave her last foreign port for the homeward run, enabled their relatives in England to calculate pretty accurately to a tide when she would get into dock. On this particular occasion she had been expected to arrive by a tide that "served" in the small hours of the morning, and when it was found she had not come up by that, it was taken for granted that she would certainly be up with the next, and as this served in the afternoon, and it was bright summer weather, a number of wives and children had strolled up to the docks to meet and welcome their husbands or fathers on landing. It was here that I saw them, and I had seldom looked upon a more cheerful group than they appeared, as I first came upon them. Two or three well-dressed,

comfortable-looking women, wives of officers, were standing a little apart, gaily chatting and laughing; wives of humbler members of the crews, some of them with infants in their arms, were also conversing pleasantly among themselves, while some half-dozen children were playing about. It was now well on towards high-water, and as they had expected the ship would come up with the first of the tide, they had already been waiting some considerable time, but still they showed no signs even of impatience, much less of alarm. One woman, alone, seemed at all nervous, and of this the others appeared to take but little notice, a circumstance that was accounted for by the fact that they knew then, as I came to know afterwards, that her excitement, up to that point, was not caused by any apprehension as to the safety of the ship. She was a "mother who had a child at sea," for the first time, and under rather trying circumstances. Her son, a fine boy of fifteen, having, boy-like, got hold of some very romantic notions anent the glories of a sea-going life, had run away to sea and got himself shipped on board the *H—*, a fact which he had announced in a letter posted within an hour of her sailing. A little reality, however, had speedily cured him of his romantic ideas, and he had written from a foreign port expressing sorrow for what he had done, and asking forgiveness. He mentioned that, owing to the clandestine manner in which he had left home, he was wofully short of clothing, and wound up by exclaiming with boyish fervency, "Oh, only let me get back to my mother, and my bed, and no more sea for me." The asked-for forgiveness, it need scarcely be said, had been granted by anticipation, and the loving mother, provided with a bundle of clothing, was waiting there, only anxious to take her young prodigal to her arms. After a time some of the watchers began to get tired of waiting, and presently one of them, going up to two dockyard officers, who were talking together in an excited fashion, asked,—

"When will the *H—* be up?"

"Never again!" unhesitatingly answered one of the officials, who must have been greatly lacking in sense or feeling.

"What do you mean?" asked the woman, instantly becoming alarmed; "I'm speaking of the *H—* belonging to — and Co."

"So am I," he answered in the same emphatic tone in which he had previously spoken. "She'll never come into dock again, she has gone down with every soul on board."

The look of horror that came over the woman's face showed the man what his abruptness had done, and he stammeringly began some apology or attempted retraction, but he spoke to unlistening ears. For a few moments she stood dazed. Then recovering herself somewhat, she walked, or staggered back to those she had left, and in the tone and manner of one telling a thing she could scarcely credit or understand, said—

"He says she has gone down with all hands."

In an instant all was confusion and agitation, but there was no loud-voiced lamentation, save in the case of a girl of about thirteen, who began to cry in very distressing fashion, and seemed about to go into hysterics.

Seeing this, one of the women, putting aside her own trouble for the moment, turned consoler.

"Don't cry, dear; don't take on like that," she said soothingly, and putting her arms round the child as she spoke. "It may not be true, you know; I don't think it can be, he must have been thinking of some other ship."

"Oh, but if it should be," sobbed the child; "my poor mother! my poor mother, what will she do? I am the oldest of seven."

While this was going on one of the women, more self-possessed than the others, had gone to the dock-master's office, from which in a few minutes she returned, her face ghastly pale, and her limbs trembling. "It is true," she said, in a low, scared tone, "too true, God help and pity us all."

In an instant the other women, with faces as white as her own, were pressing around her, wildly asking questions, which, however, it was not in her power to answer. The dock-master had not told her the *H—* was lost, he had merely tried to evade saying that she was not, and turned his face to the wall when questioned. But to the sailor's wife this was enough. She knew that the kind-hearted official had no word of hope or comfort to offer her, and that it was in pity that he turned from her.

The watch so fondly and confidently supposed to be for the living and loved, had in point of fact been a bootless watch for "the unreturning brave," who, their earthly voyage done, were sunk in the vast and wandering grave that the mighty ocean gives its dead. What the inferior, less thoughtful official had said, was all but literally true. Sixty hours before the *H—* having got out of her course in a dense fog of which there had been no indication in England, ran upon a

rock and sank almost instantly, one man of her crew alone escaping to tell the tale. Clinging to some wreckage, he had been drifted to a rock on to which he managed to clamber. There he had remained some twelve hours until on the fog lifting he was descried by some French fishermen who took him off, and after ministering to his immediate necessities placed him in communication with the British consul of the nearest port. The consul on hearing the story of the shipwrecked sailor, had telegraphed news of the wreck to the owners of the *H—*, who in their turn telegraphed to a foreign agent to proceed to the part of the coast off which the wreck had taken place, and make search and inquiry, as to the possibility of others of the crew being saved. The later intelligence of this agent had, however, only confirmed the narrative of the sailor—all of the crew of the *H—*, save he alone, had perished with the ship. She was added to the list of total wrecks, the wives and children of her crew to the longer list of sea-made widows and orphans. The account of the wreck figured in the newspapers for a day or two, and then was forgotten by the world at large—but not in my district. There the memories of it were life-long as well as sad.

In connection with this particular wreck it fell to my lot to undertake the painful duty of "breaking the news" to a near relative of one lost at sea. On this occasion I had to bear the sad tidings to the daughter of one of the principal officers, a fair young girl just entering into womanhood. She was already motherless, and now I had to inform her that she was wholly an orphan, that she had lost—and so suddenly lost—the father between whom and her, there had, owing to the peculiar position in which they were placed, been a love exceeding even that ordinarily existing between parent and child.

I tried to command my countenance before entering her presence, but I suppose unsuccessfully. The pity for her, the nervous shrinking from the performance of the sorrowful task I had accepted, must, despite my efforts, have found expression in my looks, for though my calling upon her would in itself have been no unusual thing, she seemed instantly to divine that

"So sad a messenger,
Some fearful news must bring."

Going along, I had been trying to arrange in my mind how best to say what I had come to tell; but I was now relieved from any difficulty on that score. "What is it! What is wrong! What has happened!" she gasped

out before I could utter a word, her face flushing, and her whole frame beginning to tremble as she spoke. "Oh don't, don't say it's my father," she hurried on, laying her hands on my arm, and fixing her eyes upon me in a manner that made me avert my own. "Don't say that," she went on, her tone and look becoming more deeply agonized at each word; "don't say that you've come to tell me that the ship is lost, that my dear good father is gone."

My continued silence answered her but too well, and throwing up her arms with a despairing gesture, she sank into a seat, and became so still and passive that I began to fear for her reason. But presently came the sweet relief of tears, and her sorrow again found voice. For the moment she was all alone with her grief, seeming unconscious of my presence, and of all outward surroundings. "My father! my dear good father!" she sobbed, "I shall never hear your loving voice, or see your kind face again; never! never! never!" As she spoke her eyes were wide open, and appeared to be gazing fixedly into a far, far distance, as though her own words acting upon her imagination, had conjured up a vision of the illimitable distance of the never-more across which it was not given to human eyes to see. Presently, her gaze coming back, so to speak, as the current of her ideas changed, she went on in the same vehement, self-engrossed tone. "I can see him now before me, just as he looked when he last bid me good-bye, as I shall never see him again, never! never." This never! never! was the burden of her cry, and it was uttered with a dreariness and hopelessness that was as indescribable as it was heartrending.

To have attempted consolation during the first agonized outburst of her grief would have been worse than useless, and so I bided my, or rather her, time. In a short space, partly from physical exhaustion, she became somewhat calmer, and turning to me asked, "How was it?"

In reply I told her the story of the wreck as briefly and delicately as I could.

"Ah, my poor father!" she said, speaking in a more self-controlled tone; "he has often said that he had a feeling that he should die in harness, and he has at last, after twenty years and a hundred and fifty runs." Then, getting excited again, she exclaimed, "I can't realise it! I can't believe that he will never come home again; that I shall never see him more—never! never!"

As she paused again exhausted, I felt that

the time had now come when I might speak with profit. Though still greatly agitated, her mind was so far recovered from the first overwhelming shock as to leave her capable of listening understandingly to a reminder of

the sweet and sustaining consolation that lay in the heavenly mercy and promises, and, in her case, I was in a position to put that consolation strongly. I had known her father; knew that he was one in whom familiarity

Page 326.

with the wonders of the mighty deep had wrought the lesson it might well be thought they would work in all who "follow the sea," an appreciation of and reverence for that divine and almighty Power that at will can call forth the winds or still the waves. He

was a sincere and devout Christian, and as such was "aye ready" for the Master's call, come it never so suddenly.

"You need not believe it," I said, taking up the girl's last words. "It is true you will never see him again in this world; but what,

after all, is this world, and the longest lifetime of any creature in it? The *never* of this world is not worth a thought in comparison with the *ever* of the brighter world to come, and God in his loving-kindness has provided that you can, if you will, meet your father again in the happy everlasting world beyond. Let his death sanctify your life; let the desire to meet him again be an additional inducement to you to live, and work, and pray, that when the hour of your own death comes, even should it come as suddenly as your father's did, it may find your calling and election sure. Ask God to so sanctify this death to you;" and without further parley I drew her on to her knees beside me, and, after listening with bowed head for some minutes, she was herself able to join in the words of prayer; and when a little later I took my leave, I left her prayerful in spirit, and much strengthened and comforted.

This of "breaking the news" is ever a sad office. Not from what you have to say, but from what you have to see. The news generally breaks itself. If it is not read in your looks, the first word hinting at something or anything wrong is generally sufficient. In an instant you are met with the cry of, "My husband," "My boy," "My father," as the case may be, "is gone," and the worst thus instinctively concluded, it is the truest kindness to simply admit that it is so. In this sense the *telling* of the news is easy enough, it is the sight of the agony it inflicts that distresses and unmans you. Sometimes it is received with a cry of despair that rings in your ears for years; at other times, when the grief is too deep for cries or tears, the writhing, pain-stricken look of the blanched face is a thing calculated to haunt the memory for ever afterwards.

But the most painful scene to be witnessed in this connection is that of newly-made widows and orphans flocking round some survivor of the wreck in which their bread-winners have been lost. The minute and eager questionings, the fresh outbursts of grief as some answer recalls traits of character or incidents of home-life are wondrous pitiful to witness; and no less pitiful often is the emotion of the man. I have seen a man who was pointed out by the few others who escaped in company with him from a ship in which ten times their number went down, as one who, in the hour of danger, and prospect of death, had exhibited a coolness and bravery remarkable even in a British sailor. I saw this man, when under

question by the widow of one of his lost shipmates, break down and cry like a child, cry so that the poor widow, stifling her own grief, had to turn comforter.

The stories of survivors, as drawn out by such questioning, are, in their painful way, often very graphic and dramatic. The speakers tell, with all the vividness and strength of feeling that remembrance of actual participation in such scenes is calculated to give, of the terrible struggles to save the ship, which the storm has already crippled and seems to have marked for her own. They speak with bated breath of the heart-appalling howling of the wind, and rising and rushing of the waves; describe the perilous reefing operations that *must* be done, of the equally dangerous attempts to attach extemporised helms in place of the one carried away, of the sleepless nights, the weary spells at the pumps, the snap and crash of the masts when at last they go, the smashing or carrying away of the boats in the fruitless attempts to launch them, of the growing gloom, and varied bearings of the crew, as it became evident that all their efforts were vain. Then of the ship's beginning to settle down, and the supreme moment when she is seen to be surging for the plunge, and the shipmates look their last at each other, speak their last farewell, exchange their last hand grip. Some at this point will leap over, preferring to "die in the open" rather than in the trap which the sinking ship may become to them as she goes down; or if they are men confident in their power of swimming, with a view of being clear of the suction and ready to avail themselves of any floating wreckage that may rise. The majority, however, generally stand by the ship and go down with her when she makes her last plunge. If the survivor who is telling the story is one of those who has so gone down, next will come the narrative of his finding himself come to the surface again, he knows not how; of his being for the moment blinded and half senseless; of his clearing his eyes, and then finding himself within reach of some piece of the wreck, or a boat to which two or three others are clinging. Then comes the story of the longer or shorter tossing about at the mercy of the waves, and the final rescue, either by their making land or being picked up. These are the broad incidents of such narratives, apart from such particular circumstances or allusions as may have a special interest to those relatives of the lost who may be listening. These men, veritable actors in the scenes which they describe,

tell, in entrancing detail, the tragic story that is summed up in Kirke White's lines:—

"The sailors their strength did urge,
But the billow, that beat upon their winding-sheet,
And the winds sang their funeral dirge."

At other times the wreck is a story not of storm but fog. The narrators tell of the setting in of thick weather, of its deepening and deepening till all is lost in gloom—till sun and stars are hidden, and day cannot be told from night, or the sharpest eyes penetrate half a ship's length ahead. They speak of the impossibilities of taking observations; the known riskiness of sailing by the dead reckoning; the deepening anxiety on the face of the skipper as the fog continues to bear down without signs of lifting; the occasional "slowing" of the ship to cast the lead; the sense of danger and of coming evil weighing on all on board; and finally of the fatal crash either on a rock-bound coast or in collision with some other fog-shrouded ship.

Over the recounting of such reminiscences as these I have seen such grief and horror-stricken faces, and heard such harrowing lamentations, as I would not wish to recall again, even in thought. If, as many firmly believe, there are men who, either from negligence or greed of gain, and more particularly the latter, are more or less responsible for many of the shipwrecks that occur, it is scarcely possible, I should think, that they have with their own eyes seen the want and woe that the loss of life incidental to the wrecks has brought about. To them such a sight would surely bring a feeling of blood-guiltiness and, let us hope, a sense of the necessity for amendment and repentance; were it only brought about by fear—the fear lest the sorrow-clouded countenances of undone widows and wronged orphans should be arrayed against them on that great and terrible day when all will have to answer for the deeds done in the flesh.

One point with regard to which relatives are morbidly anxious is, whether the lost "suffered much" ere the end came. To have gone down after a long and desperate struggle to keep the ship afloat, or die after days and nights of suffering in an open boat, is considered to add double bitterness to death, alike for those who die and those who live to mourn them. If there can be any best in such bad matters, it is held to be best that there should be a brief foreknowledge that the danger is one from which there is no escape, and then a short, sharp ending. It is a common belief with sea-going folk—how

far it may be founded on fact or scientific inference, I cannot say—that when the end does come, it takes a long three minutes to drown a man, and "the hard three minutes" has passed into a standard phrase among them. What must have been the thoughts and feelings of the drowned during those minutes? is a fruitful theme of discourse with their surviving relatives and friends; and an earnest hope is always expressed that in the hard three minutes, if not before, the lost may have been able to make their peace with God. In most cases there is a belief as well as a hope that this has been so, and this belief, taken in conjunction with the human yearning to meet again with loved ones gone before, is often the means of turning those who are left, we will not say from their wickedness, but from a soul-endangering heedlessness—from modes of life in which there were no thought of the life to come, no leavening influence of sweet religion. In this matter, therefore, as in most others, there comes something of the spirit of good out of things evil.

No stone can mark the last resting-place of the seaman who has found an ocean grave, no mourners visit the grave, no grass grows green, no flowers bloom over him. All that there is in way of memorial to him is generally the simple mourning-card sent to friends, or hung on the walls of the homes that the sea has made desolate. They tell briefly all that can be told with certainty—that the one whose name they record "perished at sea," or "went down" with such and such a ship, or was "lost at sea" with the ship So-and-So, which left such a port on such a date, and "was never heard of more." Sometimes such a card will be met with bearing the material variation, "who died and was buried at sea." These cases, though sorrowful enough, are less bitterly distressing than the others. There is pathetic regret that the dead should have died afar from all belonging to them—that there should have been none of their own name or blood by to hear their last word, or close their eyes for their last long sleep; but at the same time there is the consolation of knowing that they would not lack for brotherly kindness—that their shipmates would tend them lovingly and well while living, and when dead see their mortal remains committed to the deep with all due solemnity and observance. Further, in these cases the shipmates of the dead man always preserve and send home a lock of his hair, and later, as opportunity offers, some of them

will call on the relatives, and tell them of his last hours and last words.

I have left myself no space to speak further, as I should have liked to have done, of my friend Ben Wilson, from whom, at various times, I heard many a sad or strange story of shipwreck, and gathered much practical and valuable information, that was subsequently of use to me in aiding or comforting those who were left to suffer and sorrow by the loss of husbands or fathers, sons or brothers, who had perished at sea.

The whole subject, indeed, might well be treated at greater length, but sufficient has already been said to show, if any showing were necessary, how deep and far-reaching is the grief and distress carried into homes on land by losses of life at sea. To those whose lot it is to witness frequent instances of such grief, and who are desirous of judging "poor human nature" with Christian charity, it seems scarcely possible to conceive that in this century and this land there can be men who, in a godless haste to be rich, can con-

tribute, even indirectly, to the risks of loss of life by shipwreck. If any such there be, the charitable can but pray that the time is at hand when their evil courses will be rooted out, not merely by legal enactments for the protection of our sailors, but by a spread of that religion whose outcome is to bring men to a true sense of their duty to God, their neighbours, and themselves. For those who show themselves regardless of the higher law there must be men-made laws; still, let us pray that the spirit of Christ, more powerful for good than any earthly law, may descend even upon those *against* whom man-made laws are directed. Let us trust that they will be brought to see that even in things of this world justice and mercy to our fellow-men are the first consideration; and that even in the great race for wealth, the only true and ultimate winners are those who, throughout the race, remember and act upon the lesson contained in the terrible and significant question, "What shall it profit a man if he gain the whole world and lose his own soul?"

THE CHEVIOT HILLS.

By JAMES GEIKIE, F.R.S.

IV.

IN the first of these papers some reference was made to the configuration of the ground in the Cheviot district. We have seen that the outlines assumed by the country have been determined in large measure by the nature of the rocks. Thus where igneous masses abound, the hills present a more or less irregular, and broken, and lumpy contour, while the valleys are frequently narrow and deep. In the tracts occupied by Silurian strata, we have, as a rule, broad-topped hill-masses with a smoothly rounded outline, whose slopes generally fall away with a long gentle sweep into soft green valleys, along the bottom of which the streams often flow in deep gullies and ravines. Where the country is formed of sandstones, and their associated strata, the hills are generally broad and well-rounded, but the outline is not infrequently interrupted by lines of cliff and escarpment. These strata, however, are confined chiefly to the low grounds, where they form a gently-undulating country, broken here and there, as in Dunian Hill, Bonchester Hill, Rubers Law, &c., by abrupt cones and knobs of igneous rock. It is evident, then, that the

diversified character of the Cheviot Hills and the adjoining low grounds depends upon geological structure. Each kind of rock has its own peculiar mode of weathering. They do not all crumble away under the action of rain, frost, and running water in precisely the same manner. Some which yield equally and uniformly give rise to smooth outlines, others of more irregular composition, such as many igneous rocks, break up and crumble down unequally in a capricious and eccentric way, and these in the course of time present a hummocky, and lumpy, and rough irregular configuration. And as soft and easily-weathered rocks must wear away more rapidly than more indurated and durable masses, it follows that the former will now be found most abundantly at low levels, while the latter will enter most extensively into the composition of the hills. But the contour of a country depends not only upon the relative durability of the rocks, but also upon the mode of their occurrence in the crust of the earth. Strata, as we have seen, do not all lie in one way; some are horizontal, others are inclined to the horizon, while yet others are

vertical. Again, many rocks are amorphous ; that is to say, they occur in thick lumpy masses which show no trace of a bedded arrangement. Such differences of structure and arrangement influence in no small degree the weathering and denudation of rocks, and cannot be left out of account when we are seeking to discover the origin of the present configuration of our hills and valleys. Thus, escarpments and the terraced aspect of many hill-slopes are due to inequalities in the strata of which such hills are built up. The softer strata crumble away more rapidly under the touch of the atmospheric forces than the harder beds which rest upon them, and hence the latter are undermined, and their exposed ends or crops, losing their support, fall off and roll down the slopes. The igneous rocks of the Cheviots are arranged in beds ; but so massive are these, that frequently a hill proves to be composed from base to summit of one and the same bed of old lava. Hence there is a general absence of that terraced aspect which is so conspicuous in hills which are built up of bedded rock-masses. Here and there, however, the beds are not so massive, several cropping out upon a hillside ; and whenever this is the case (as near Yetholm) we find the hill-slopes presenting the usual terraced appearance—a series of cliffs and escarpments, separated by intervening slopes, rising one above the other. In the Silurian districts no such terraces or escarpments exist, the general high dip of the strata, which often approaches the vertical, precluding any such contour. In a region composed of highly-inclined greywacké and shale, however, we should expect to find that where the strata are of unequal durability, the harder beds will stand up in long narrow ridges, separated by intervening hollows, which have been worn out along the outcrops of the softer and more easily-denuded beds. And such appearances do show themselves in some parts of the Silurian area. As a rule, however, the Silurian strata are not thick-bedded, and harder and softer bands alternate so rapidly that they yield upon the whole a smooth surface under the action of the atmospheric forces. In the low-lying districts, which, as I have said, are mostly occupied by sandstones and shaly beds, all the abrupt isolated hills are formed of igneous rocks, which are much harder and tougher than the strata that surround them. It is quite evident that these hills owe their present appearance to the durable nature of their constituent rocks, which now project

above the general level of the surface, simply because they have been better able to resist the denuding agents, which have decomposed and gradually carried away the softer rocks that once covered and concealed them.

We see, then, that each kind of rock has its own particular mode of weathering, and that the configuration of a country depends primarily upon this and upon geological structure. Indeed, so close is the connection between the geology and the surface-outline of a country, that to a practised observer the latter acts as an unfailing index to the general nature of the underlying rocks, and tells him at a glance whether these are igneous like basalt and porphyrite, aqueous like sandstone and shale, or hardened and altered strata like greywacké. But while one cannot help noticing how in the Cheviot district the character of the scenery depends largely upon the nature and structure of the rocks, he will, nevertheless, hardly fail to observe that flowing outlines are more or less conspicuous over all the region. And as he descends into the main valleys, he will be struck with the fact that the hill-slopes seem to be smoothed off in a direction that coincides with the trend of these valleys. In short, he cannot help noticing that the varied configuration that results from the weathering of different rock-masses has been subsequently modified by some agent which seems to have acted universally over the whole country. In the upper reaches of the Cheviot valleys, the rocks have evidently been rounded off by some force pressing upon them in a direction coinciding with that of the valleys ; but soon after entering upon their lower reaches, we notice that the denuding or moulding force must have turned gradually away to the north-east—the northern spurs of the Cheviots, and the low grounds that abut upon these being smoothed off in a direction that corresponds exactly with the trend of that great strath through which flow the Teviot and the Tweed, from Melrose downwards. Throughout this broad strath, which extends from the base of the Lammermuirs to the foot of the Cheviots, and includes the whole of Teviotdale, the ground presents a remarkable closely wrinkled surface, the ridges and intervening hollows all coinciding in direction with the general trend of the great strath, that is south-west and north-east ; but turning gradually round to east, as we approach the lower reaches of the Tweed. Passing round the north-eastern extremity of the Cheviot range into England, we observe that the same series

of ridges and hollows continues to follow an easterly direction, until we near the sea-board, when the trend gradually swings round to south-east, as in the neighbourhood of Belford and Bamburgh, where the ridges run parallel with the coast-line.

The ridges and hollows are most conspicuous in the low grounds of Roxburghshire and Berwickshire, especially in the regions between Kelso and Smailholm, and between Dunse and Coldstream. The dwellers along the banks of the Tweed are quite familiar with the fact that the roads which run parallel with the river are smooth and level, for they coincide with the trend of the ridges and hollows; whilst those that cross the country at right angles to this direction must of course traverse ridge after ridge, and are therefore exceedingly uneven. In this low-lying district most of the ridges are composed of superficial deposits of stony and gravelly clay and sand, and the same is the case with those that sweep round the north-eastern spurs of the Cheviots by Coldstream and Ancroft. Some ridges, however, consist either of solid rock alone, as near Stichill, or of rock and overlying masses of clay and stones. In the hilly regions, however, nearly all the ridges are of rock alone, especially in the districts lying between Melrose and Selkirk and between Selkirk and Hawick. Indeed, the hills which are drained by the upper reaches of the Teviot and its tributaries are more or less fluted and channelled, as it were—many long parallel narrow hollows having been driven out along their slopes and even frequently across their broad tops. This scolloped and ridged aspect of the hills, however, disappears as we approach the upper reaches of the hill valleys. From Skelfhill Pen (seventeen hundred and forty-five feet) by Windburgh Hill (sixteen hundred and sixty-two feet), on through the ridge of the Cheviot Watershed, none of the hills show any appearance of a uniformly wrinkled surface.

A close inspection of the rock-ridges satisfies one that they have been smoothed off by some agent pressing upon them in a direction that coincides with their own trend; and not only so, but the smoothing agent, it is clearly seen, must have come from the watersheds and then pressed outwards to the low grounds which are now watered by the Teviot and the Tweed. We see this in the manner in which the rocks have been smoothed off, for their smooth faces look towards the dominant watersheds, while their rough and unpolished sides

point away in the opposite direction. Sometimes, however, we find more or less steeply projecting rocks *facing* the dominant watersheds. When this is the case, there is usually a long sloping "tail" behind the crag—a "tail" which is composed chiefly of superficial deposits. The hills between Hume and Stichill afford some good examples. The two kinds of appearances are shown in outline in the accompanying diagram. The appearance shown in Fig. 12 is of most common occurrence in the upland parts of

Fig. 12. Rounded Rocks, with superficial deposits, *z*, lying behind steep face. The arrow indicates the direction followed by the smoothing agent.

Fig. 13. "Crag and tail;" boss of hard rock *c* intersecting sandstones *s*; *z*, superficial deposits resting behind projecting rock. The arrow indicates the direction followed by the smoothing force.

the country, while "crag and tail" (as shown in Fig. 13) is seen to greatest advantage in the open low grounds. In both cases it will be observed that superficial deposits *z* nestle behind a more or less steep face of rock. The arrows indicate the direction followed by the smoothing agent.

When the rocks have not been much exposed to the action of the weather, they often show a polished surface covered with long parallel grooves and striæ or scratches. Such polished and scratched surfaces are best seen when the superficial deposits have been only recently removed. Often, too, when we tear away the thick turf that mantles the hill slopes, we find the same phenomena. Indeed, wherever the rocks have not been much acted upon by the weather, and so broken up and decomposed, we may expect to meet with more or less well-marked grooves and striæ. Now the remarkable circumstance about these scratches is this—they agree in direction with the trend of the rock-ridges and hollows described above. Nor can we doubt that the superficial markings have all been produced by one and the same agent. In the upper valleys of the Cheviots, the scratches coincide in direction with the valleys, which is, speaking generally, from south to north in Scotland, but as we approach the low grounds they begin to turn

more to the east (just, as we have seen, in the case with the ridges and hollows), until we enter England to the east of Coldstream when the stræ point first nearly due west and east, but eventually swing round to the south-east, as is well seen upon the limestone rocks between Lowick and Belford. In Teviotdale the general trend of the stræ is from south-west to north-east, a direction which continues to hold good until the lower reaches of the Tweed are approached, when, as we have just mentioned, they begin to turn more and more to the east. Thus it becomes evident that the denuding agent, whatever it was, that gave rise to these ridges and scratched rock-surfaces must have pressed outwards from all the dominant watersheds, and, sweeping down through the great undulating strath that lies between the Cheviots and the Lammermuirs, must have gradually turned away to the east and south as it rounded the northern spurs of the former range, so as to pass south-east over the contiguous maritime districts of Northumberland.

A few words now as to the character of the superficial deposits which enter so largely into the composition of the long parallel banks and ridges in the low grounds of Roxburghshire, Berwickshire, and the northern part of Northumberland. The most conspicuous and noteworthy deposit is a hard tough tenacious clay which is always more or less well-charged with blunted and subangular stones and boulders, scattered pell-mell through the mass. This clay is as a rule quite unstratified—it shows no lines of bedding, and although here and there it contains irregular patches and beds of gravel and sand, yet it evidently does not owe its origin to the action of water. Its colour in the upper part of Teviotdale and the Cheviots is generally a drab-brown, or pale grey and sometimes yellow, while here and there, as in the upper reaches of the Jed valley, it is a dark dingy bluish grey. In the lower parts of Teviotdale and in the Tweed district it is generally red or reddish brown. The stones in the clay have all been derived from the rocks of the region in which it occurs. Thus in Teviotdale we find that in the higher reaches of the dale which are Silurian the stones and boulders consist of various kinds of greywacké, &c. In the lower reaches, however, when we pass into the red sandstone area, we note that the clay begins to contain fragments of red sandstone, while the clay itself takes on a reddish tinge, until we get down to the vale of the

Tweed, when not only is the clay very decidedly red, but its sandstone boulders also are very numerous. The same appearances present themselves in passing outwards from the Cheviots. At first the clay contains only stones that have been derived from the upper parts of the hills, but by-and-by, as we near the low grounds, other kinds begin to make their appearance, so that by the time we reach the Tweed we may obtain from the clay specimens of every kind of rock that occurs within the drainage area of the Teviot and the lower reaches of the river Tweed.

Look at the stones, and you will observe that all the harder and finer grained specimens are well-smoothed and covered with stræ or scratches, the best marked of which run parallel with the longer diameter of each stone and boulder. These scratches are evidently very similar to those markings that cover the surface of the underlying solid rock, and we may feel sure, therefore, that the denuding agent which smoothed and scratched the solid rocks had also something to do with the stones and boulders of the clay.

Underneath the stony clay, or *Till*, as it is called, we find here and there certain old river gravels. We know that these gravels are river formations, because not only do they lie at the bottom of the river valleys, but the stones, we can see, have been arranged by water running in one constant direction, and that direction is always *down* the valley in which the gravels chance to occur. Frequently, however, there is no trace of such underlying gravels, but the till rests directly upon the solid rocks.

Now what do all these appearances mean? It is clear that there is no natural agent in this country engaged in rounding and scratching the rocks, or in accumulating a stony clay like till. In alpine regions, however, we know that glaciers, as they slowly creep down their valleys, grind and polish and scratch the solid rocks over which they pass, and that underneath the moving ice one may detect smoothed and striated stones precisely resembling those that occur in till. Frost in such alpine regions splits up the rocks of the cliffs and mountain slopes that overlook a glacier, and immense masses of angular stones and *débris*, thus loosened, roll down and accumulate along the flanks of the ice-streams. Eventually such accumulations are borne slowly down the valley upon the back of the glacier, and are dropped at last over the terminal front of the ice,

where they become intermingled with the stones and rubbish, which are pushed or washed out from underneath the ice. These heaps and masses of angular *débris* and stones are called "moraines," and one can see that in Switzerland the glaciers must at some time have been much larger, for ancient moraines occur far down in the low grounds of that country—the glaciers being now confined to the uppermost reaches of the deep mountain valleys. Moreover, we may note how the mountain-slopes overlooking the present puny glaciers have been rubbed by ice up to a height of several hundred feet above the level of the existing ice-streams. Now since the aspect presented by the glaciated rock-surfaces of Switzerland is exactly paralleled by the rounded and smoothed rocks of Scotland, there can be no doubt that the latter have had a similar origin. Again, we find throughout the low grounds of Switzerland a deposit of till precisely resembling that which is so well developed in Teviotdale and the valley of the Tweed. And as there can be no doubt that the Swiss till has been produced by the action of glacier ice, we are compelled to believe the same of the till in Scotland.

Let us further note that in the deep mountain valleys of Switzerland the glacial deposits consist for the most part of coarse morainic *débris*—of such materials, in short, as the terminal moraines of existing glaciers are mainly composed of. Not infrequently this morainic *débris* has been more or less acted upon by the rivers that escape from the glaciers, and the angular stones have been rounded and arranged in bedded masses. It is only when we get out of the great mountain valleys and approach the low grounds that till, or stony clay, begins to appear. The same phenomena characterize the Cheviot district. In the upper reaches of the mountain valleys at the heads of the Teviot, the Kale, the Bowmont, &c., till either does not occur or it is thin and often concealed below masses of rude morainic *débris* and gravel. Out in the low grounds, however, till, as we have already remarked, is the most conspicuous of all the superficial deposits. From these facts it may be inferred that till indicates the former presence of great confluent glaciers, while morainic *débris* in hill-valleys points to the action of comparatively small local and isolated glaciers.

What, then, are the general conclusions which may be derived from a study of the rock-ridges, flutings, and striæ, and the till

of the Cheviot district? Clearly this, that the whole country has at one time been deeply buried underneath glacier ice. The evidence shows us that the broad strath stretching between the Lammermuirs and the Cheviots must have been filled to overflowing with a great mass of ice that descended from the uplands of Peebles and Selkirk and the broad-topped heights that overlook the sources of the Teviot. The Cheviots appear to have been quite buried underneath this wide sea of ice, and so likewise were the Lammermuirs. At the same time, as we know, all Scotland was similarly enveloped in a vast sheet of snow and ice, which streamed out from the main watersheds of the country, and followed the lines of the chief straths, that is to say, the general slope of the ground. The track of the ice in the Cheviot district is very distinctly marked. In Teviotdale it followed the trend of the valley, and, grinding along the outcrop of the Silurian strata, deepened old hollows and scooped out new ones in the soft shaly beds, while the intervening harder strata which offered greater resistance to the denuding action of the ice, did not wear so easily, and so were rounded off, and formed a series of ridges running parallel to the eroded hollows. The stones and rubbish, dragged along underneath the ice, necessarily increased as the glacier mass crept on its way. The rocks were scratched and grooved by the stones that were forced over them, and the polishing was completed by the finer sand and clay which resulted from the grinding process. Wherever a rock projected there would be a tendency for the stones and clay and sand to gather behind it. One may notice the same kind of action upon the bed of a stream, where the sediment tends to collect in the rear of prominent stones and boulders. And we can hardly fail to have observed further that the gravel and sand of a river often arranges itself under the action of the current in long banks which run parallel to the course of the water. So underneath the ice-sheet did the stones and sand and clay behave. Behind projecting rocks in sheltered nooks and hollows, they accumulated, while in places exposed to the full sweep of the ice-stream they were piled up and drawn out into long parallel banks and ridges, the trend of which coincided in direction with the ice-flow. The presence of confused and irregular patches and lenticular beds of sand, clay, and gravel in the till is not difficult to understand when we know that there is always more or less water flowing on underneath a

glacier. Such streams must assort the ice *débris*, and roll angular fragments into rounded stones and pebbles; but the materials thus assorted in layers will ever and anon be crushed up so as to be either partially or wholly obliterated by the slowly moving glacier.

As the stones and clay were derived from the underlying rocks, it is no wonder that the colour of the till should vary. In the Silurian tracts it is pale yellowish, or bluish grey, and the stones consist chiefly of fragments of Silurian rocks, all blunted and smoothed, and often beautifully polished and striated. When we get into the red sandstone region of the low grounds the colour of the clay begins by-and-by to change, and fragments of red sandstone become commingled with the Silurian stones, until ere long the colour of the deposit is decidedly red, and sandstone fragments abound. Everywhere the stones show that they have been carried persistently in one direction, and that is *out from the watershed, and down the main valleys*.

The direction of the ice-marks upon the solid rocks, and the trend of the "drums," as the parallel ridges of till are termed, show that the ice-sheet of Teviotdale and Tweed gradually turned away to the east and south-east as it swept round the north-eastern spurs of the Cheviots. Now we may well ask why the ice did not go right out into the North Sea, which is apparently the course it ought to have followed. The same curious deflection affected the great ice-stream that occupied the basin of the Forth. When it got past North Berwick, that stream, instead of flowing directly east into the North Sea, turned away to the south-east and overflowed the northern spurs of the Lammermuirs, bringing with it into the valley of the Tweed stones and boulders which had travelled all the way from the Highlands. It is obvious there must have been some impediment to the flow of the Scotch ice into the basin of the North Sea. What could have blocked its passage in that direction? At the very time that Scotland lay concealed beneath its ice-sheet, Norway and Sweden were likewise smothered in ice which attained a thickness of not less than five or six thousand feet. The whole basin of the Baltic was occupied by a vast glacier which flowed south into Northern Germany, and this sheet was continuous with glacier-ice that crossed over Denmark. When we consider how shallow the North Sea is (it does not average more than forty fathoms between Scotland

and the Continent), we cannot doubt that the immense masses of ice descending from Norway could not possibly have floated off, but must actually have crept across the bottom of that sea until they abutted upon and coalesced with the Scotch ice, so as to form one vast *mer de glace*. Thus it was that the Scandinavian ice blocked up the path of the Scotch glaciers into the basin of the North Sea, and compelled them to flow south-east into England.* Had there been no such obstruction to the passage of the Scotch glaciers, it is impossible to believe that snow and ice could ever have accumulated to such a depth in Scotland. The Scotch ice reached a thickness of some three thousand feet in its deeper parts. It is evident, however, that had there been a free course for the glaciers, they would have moved off before they could have attained this thickness. And we can hardly doubt, therefore, that it was the damming-up of their outlet by the great Scandinavian ice-sheet that enabled them to deepen to such an extent in the valleys and low grounds of Scotland.

When the ice-sheet was at its thickest, the Cheviots were completely covered, nevertheless they served to divide the ice-flow between Scotland and England, although here and there one finds that the ice passed over some of the lower summits, carrying with it boulders and stones. This is by no means an uncommon circumstance in Scotland and other glaciated countries. Thus we note that Highland boulders have been brought into the vale of the Tweed across the Lammermuirs; and in the same way boulders from the heights overlooking Eskdale have been carried over some of the lower hill-tops into the vale of the Teviot. In like manner the Swedish ice occasionally overflowed the lower mountain-tops of the dividing ridge or watershed into Norway.

What wonder now that the Cheviot area should exhibit so many flowing outlines, that the hills should be so smoothed and rounded and fluted, that the low grounds should be cumbered with such heaps of clay and striated stones? Long before the great glaciers appeared, the rocks had been weathered and worn by the action of the usual atmospheric forces, and each had assumed its own peculiar outline; but how greatly has this been modified by the grinding action of the ice-sheet! How projecting rocks have been rubbed, and what destruc-

* In the extreme north of Scotland we find that the Scotch ice was, in like manner, compelled to turn aside and overflow Caithness from south-east to north-west.

tion has befallen the loose accumulations of river gravel, sand, and clay that gathered in the valleys before the advent of the Ice Age! All that now remains of these are a few patches preserved here and there underneath the till. The Cheviots can tell us nothing of the kinds of plants and animals that clothed and peopled the country in pre-

glacial times. All we learn is that streams and rivers flowed as they flow now, and that by-and-by everything was changed, and the land disappeared underneath a vast covering of snow and ice.

In my concluding paper I will show how this ice period passed away, and how the present condition of things succeeded.

A SIXTEENTH-CENTURY REVIVAL.

THE Anabaptist movement in the first half of the sixteenth century was undoubtedly a real "revival."

If you ask, "Why, then, was it mixed up with so many social extravagances?" I ask you, in turn, to think what the yoke of Rome had been, how it had crushed out all aspiration, nipped in the bud all spiritual life; and therefore, as matter of course, when the yoke was broken, those whom it had kept down knew not what to make of their new liberty. Moreover, though doubtless in the dark ages the Church had stood with the poor against oppression, it had, long before the sixteenth century, become the handmaid of secular tyranny. Its prelates were great nobles; it was wealthy, and anxious to keep and to increase its wealth. For men who had begun to read their Bibles, a more unscriptural personage than a German prince-bishop, who had bought his preferment, if he had not got it by some questionable political intrigue, it is impossible to imagine.

Hence it was, that almost all mediæval sectaries thought the state of society rotten as well as the state of religion; and hence it was that society, as well as the priesthood, was always against them. What blood and tears, what untold misery, went to the putting down of such sects as the *Paterini*, for instance, who, first noticed in Italy, though they came from eastern Europe, spread through France, and over to our own island. With what unction that joker of jokes, Walter of Mapes, who wrote "The Courtiers' Jest-book" (*Nugæ curialium*), tells how the misbelieving wretches, who, he said, worshipped the devil under the form of a big rat (rats were newly come into Western Europe), were turned out of town and village, and left to perish of cold and hunger in the very hard winter of the year of grace, 1272. One thinks of the New Forest Shakers; save that the *Paterini* had no lady to give them £2,000, and not even a barn or a tent to

shelter in when priests anathematized them and magistrates drove them forth. It was always the same—Albigenses, followers of Peter Waldo, Bohemian Taborites—the Church always persuaded the State that they were dangerous, and ought to be stamped out. And so it was with the Anabaptists of 1520, and later. At first there was nothing political about them. No doubt they believed the Pope was Antichrist, and the Roman Church the mother of all abominations; and they used of "the world" the phrases which they found ready to their hand in St. John, looking (as the first Christians had looked) for "a new world wherein dwelleth righteousness," and for the doing away with the present godless order of things. But this, they held, was not to be man's work. Had not Christ, in the garden, bidden Peter put up his sword into the sheath? "Society" was doomed, but its destruction would be wrought by God, not by man. A harmless set of men they were, full of wonderful enthusiasm, not content with talking about well-doing, but working with a will at all sorts of good works.

Romanism had stifled the national conscience in every European country. Even Lutheranism was soon found to be tending to become merely formal. The religious houses had been seized, the old clergy had been turned out; and then, after the strain, came a reaction, the people settled down on their lees. "Men are getting so lukewarm," writes Wicel in 1531, "that if a preacher insists on the need of coming back to God, and giving up one's sins, and leading a good life, he is called an Anabaptist." The name had come to be used just as "Methodist" was at one time used among ourselves; and its being so used is a proof that the earnestness of these people did not evaporate in talk. But I am not concerned now to point out the spiritual value of what they taught, or even the wonderful beauty of much that they taught. What I want to show is, how people

who blindly strove to draw nearer to God than the official religions enabled them to do, were then treated. One word might suffice, for they were persecuted by everybody—by Protestants as much as by Romanists; Bucer, and Zwingle, and the Zurich magistrates were hardly less bitter against them than the prince-bishop of Münster himself. Toleration in those days was not even understood. Of course it was natural for Romanists to be intolerant, toleration on their part would have been illogical; but Lutherans and Calvinists were almost as persecuting as their old enemies of the Papacy, though their own existence was based on "the right of private judgment;" claiming it for themselves, they were apt to deny it to others. As Lord Macaulay remarks, in reference to our Commonwealth, "No one at that time thought of practising toleration, or even understood the meaning of the word, *except a few Anabaptists*." They had been persecuted by every party, and in this way the truth that "let be" is the only true rule in matters of opinion, seems to have been brought home to them. It is astonishing how soon the different Protestant communities tacitly acquiesced in the maxim, "*Cujus regio ejus religio*"—that a man was bound to keep to the established religion of the country in which he was born. Romanism, for instance, was wrong; it would be shocking in a Scotchman or a Hessian to turn Papist, but with a Spaniard the case was different, he was born to it. In such communities Anabaptism was, of course, an offence. For a short while, indeed, during the "Peasants' War," everybody, all Germany over, was free to teach what he pleased. Princes and bishops were too busy struggling for dear life to look into what a few visionary preachers were doing. But when the battles of Frankenhausen and Mühlhausen had ruined the peasants' cause, repression began to be the order of the day. The little towns of Waldshut and Hallau, for instance, on the Swiss frontier, had been practically independent while the struggle was going on, and during their independence they had become almost wholly Anabaptist. When the war was over, they passed again under the house of Austria, and the people had at once to banish their preachers, and either to conform to Romanism, or else to leave their homes and country.

This was no idle threat; if men lingered, they might lose their chance of escape. In the Tyrol, between 1527 and 1531, nearly a thousand Anabaptists were put to death. Seventy-five were executed in less than two

months in the little town of Linz, the capital of Upper Austria, on the Danube. Bavaria was even worse than Austria. Duke William ordered every *Anabaptist to be killed*; if he recanted at the last moment, all the favour he got was to have his head cut off; if he was obstinate, he was burnt alive. In Swabia, the sectaries were generally put to death without being tried. Often death was inflicted with the most horrible tortures, for the punishments in those good old times were incredibly cruel, especially in Germany.* For instance, at Rothenburg, on the Neckar, in 1527, Michael Sattler, an Anabaptist teacher, was burnt alive, after having had his tongue pulled out, and his flesh torn away with red-hot pincers. In Protestant states they did not usually torture, they either beheaded the Anabaptists or drowned them. This last was the favourite method in Switzerland. "They insist on total immersion" (said Zwingle), "I'll give them more of it than they'll like." The only prince who treated them with anything like humanity was Philip, the bigamous Landgrave of Hesse, he whom Luther supported in his bigamy. "Persecute them as I do," said the Elector of Saxony. "No," replied he, "I'll treat them just as I did those silly peasants. A few of the worst must go to prison; but, with all, my aim will be to lead them, not to force them, to the truth." Philip was too strong to be put down, so he was allowed to have his way; smaller men who tried to act humanely were compelled to be bigots. Thus, Prince Lichtenstein (the Lichtensteins were sovereign princes till the other day, with the right of coining their own money) had given an asylum on his Moravian estates to the Anabaptists, who had been turned out of Waldshut. There they seemed for some time happily out of sight. Hulmaier, one of their teachers, called Nikolsburg, the little town in which they settled, *Emmaus in Moravia*. Other communities were soon founded at Brünn, Znaim, Austerlitz, and other places in Moravia and Bohemia. But they were not long left unharassed; Archduke Ferdinand said to the prince: "Give up your arch-heretics to me," and Lichtenstein obeyed. Within two years after he had begun preaching at Nikolsburg, Hulmaier, an old professor of Ingolstadt University, was burned alive, showing the

* Cruelty was not of one country or creed, but of all. Witness the incredible tortures which Didrich Sonoy, Governor of North Holland, inflicted on some suspected of sympathy with Spain—putting a jar full of rats on a man's naked body, and heating the jar, so that the maddened creatures might tear his vitals (see Motley, part iv. ch. iii.)

same indomitable courage and calm resignation which John Huss had already shown. Brödl and Blaurock, two other preachers, were put to death in the same way. Hätzer was beheaded at Constance; and Langenmantel, of a patrician family in Augsburg, was burnt by the Swabian authorities. This is what persecution meant in those days. Even Strasburg, where the Anabaptists were tolerated for a time, at last drove them out. Holland was their only place of refuge in Europe, and even there they did not always get full toleration. No wonder that men who were hunted in this way should grow wild in their views, and desperately fanatical in their teaching. Surely the end must be at hand of a world in which such things were permitted; the "souls under the altar" were crying: "How long, O Lord?" and their cry must be heard. One man, Hut, who was afterwards put to death, fixed the end of the world for Whit-Sunday, 1528. The Lord would come, and would gather together the faithful few, and all the rest of the human race would pass away into destruction. Melchior Hoffmann, a furrier, who had preached a great deal in Livonia, and afterwards in Holland, put forth the same views; he taught that the end of all things was at hand, and found Dutchmen enough of like opinions to form a numerous sect, the Melchiorites, who held by him implicitly. By-and-by he came to Strasburg, was imprisoned by Bucer, and, losing his senses in confinement, gave out that he was Elias, the forerunner of the Christ, who was at once to make his second advent. This wild stuff he preached through his cell window to thousands, who flocked into the moat, eager to catch the inspired prisoner's every word. The authorities tried to keep them away, but they came all the more; and Hoffmann went on preaching till his death, which happened suddenly in the prison. Most of us have heard about the sort of "Christ" who did appear—the Anabaptist tailor, John of Leyden—who for more than a year and a half held the episcopal city of Münster, and set the bishop at defiance. It is hard to tell what Melchior, the messenger of the Christ, would have thought of such a strange Messiah; for this Münster business is a sad story of human folly atoned for by the cruelty with which it was stamped out when the city was taken. But still, on the whole, despite such extravagances, the Anabaptist movement was a "revival" in the true sense of the word; it gave spiritual life to thousands who had been grovelling in brutish ignorance. A creed whose professors met suffering and

death as these people did, must have had a good effect on the moral tone of the age. To see men and women mount the scaffold or go to the stake singing hymns and praising God that they were found worthy to suffer for Him, was like going back to the times of primitive Christianity. No wonder that Anabaptists multiplied; as of old, the blood of the martyrs was the seed of the Church. Every congregation kept a list of its martyrs; and these were handed about from town to town, that town being the proudest which could show the longest list. No wonder the lives of many of "the brethren" were marvels of self-devotion and purity; what could one, who might at any moment be seized and hurried out of this world, care for the trifles which make the sum of most of our lives? There must have been a terrible sincerity about these people. Nowadays it is so easy to say that we believe, for saying so costs us just nothing at all, except the occasional use of a few religious phrases; their belief meant giving up everything, and being ready to meet the cruellest of deaths.

Hence there are two points of contrast between the Anabaptist "revival" of the sixteenth century, and that which has lately been going on in England; there could be no mistake about that; a man or woman would not have turned Anabaptist in those days for fashion's sake, or because he or she was carried away by the excitement of a multitude. There was nothing exciting about the life, except its too probable end. Community of goods, adopted as having been the usage of the earliest Christians, was almost forced upon the Anabaptists by the circumstances in which they were compelled to live. The children, for instance, were naturally fed, taught, and clothed at the cost of each "church," for no parent could be sure that before a week was over his family would not for ever be deprived of a father's, perhaps also of a mother's, support. The regulation of marriages followed as matter of course; in times like those, "the church" was better able to judge than the individual, whether in his or her case marriage was desirable, or whether St. Paul's advice to the Corinthians (1 Cor. vii. 29—31) should be acted on; and, if desirable, with whom. Rules like these, interfering more or less with the liberty of the individual, are found in most close religious bodies; the Anabaptist communities, especially those in Moravia, had many points in common with the Shaker communities of America, for instance. That was

the normal state of Anabaptism. Why, at Münster, under this John Bockelsohn, and his lieutenant Kniperdolling, their practices took such a wildly different form, and degenerated into shameful excesses, seems simply due to the fact that elsewhere the sect was persecuted, while at Münster it had for some time not only the upper hand, but the complete control of law and justice and everything. When people believe that "the Law" is solely for "the ungodly," while they are "the godly," there is no knowing into what extravagances they may run, if there is no civil magistrate to check them. How sober German burghers could let a madman (for John of Leyden must have been mad) bring absolute ruin on their town, upsetting every authority, destroying almost every relic of antiquity—among them a priceless library of classical MSS., purchased in Italy by one of the bishops—and outraging all right feeling by the grossest acts of immorality, and the most diabolical cruelty, it is impossible to understand. There is the fact; the success of Mormonism, the final acts of the Paris Commune (though these were propriety and saneness itself compared with Bockelsohn's *saturday* at Münster), show that even nowadays the power of delusion is pretty strong. But still we are better than they were; and this is the second point which the story of these Anabaptists teaches. The first was, that theirs was an intensely practical creed, not evaporating in talk, but determined to do something. Here is a contrast with the present day; we tend to be unreal in our revivalism as in most other things; and this is not to our praise, though, as far as revivals go, it perhaps rids us of some of the most crying evils connected with them. The other point of contrast is all in our favour; it is the very different way in which "society" now deals with sects like these Anabaptists. Men cannot be martyrs nowadays if they would. A German Anabaptist, three hundred and fifty years ago, a fifth monarchy man in Cromwell's time, were likely at any moment to suffer for their faith. At this age of the world people do not suffer in that way, not even in Spain or Mexico; public opinion would not stand it; and that, I think, is the one thing on which the modern world may congratulate itself. Some folks are constantly telling us that the world is getting worse and

worse; they acquiesce in the deterioration as "a sign of the end." I find it hard to answer them when I think of Emma Mines; of speculators bloated by the ruin of hundreds; of the whole Dowlais district, where such colossal fortunes have been made by the masters, and such untold sums wasted on drink by the men, reported to be without a single hospital, though accidents must have been happening there daily.

It is very true that evil now comes more to the front because everything nowadays is known; light is thrown into all sorts of dark corners which in "the good old days" no one thought of spying into. People then starved and fell ill and rotted away, without anybody troubling himself about it; it was the will of God. When such things happen now there is at once an outcry. That is a happy change, I say to myself, and truly consoling; and when I want more lively comfort, I take up some old story, like that of these German and Swiss Anabaptists, and seeing how differently such folks are treated, and how differently they behave nowadays, I feel sure that real progress towards good has been made. Yes; despite our uncharitableness—sect damning sect—we are more tolerant (no thanks to the sects for that—the magistrate, more truly Christian than the "professors," keeps us in order), and despite our extravagances (and they are great, both among the orthodox and the "spiritualists"), we keep clear of the excesses into which, after the persecutions that I have detailed, these German fanatics fell. We don't try to quench the fires of fanaticism in its own blood, and therefore it takes a mild form, and warms and cheers instead of wasting in wild conflagration. John of Leyden, and Kniperdolling, were the logical outcome of the burnings and beheadings of a dozen years; "the saints" were at last to reign, and they did reign with a vengeance. We escape such horrors by virtue of that one blessed fact: we have learnt to be tolerant—to leave men free in their opinions, provided they don't outrage the usages of society. That "secular arm," which the Church used always to call in to punish the heretics, from being merely an arm to smite, has become also a head to guide. The magistrate is supreme, and not the bigot.

HENRY STUART FAGAN.

THE RAINBOW THE TYPE OF THE COVENANT.

BY THE REV. CANON ELLIOTT.

IT has been well said that "the history of Noah, next after the history of Christ, is that which perhaps most forcibly arrests our thoughts, impresses our consciences, and yet revives our hopes."* It is beside our present purpose to discuss the philosophical explanation of the flood, or the extent of the area over which it prevailed. This much is certain, if we receive the account which is contained in the Book of Genesis as history, not as fable, that a more awful judgment was never inflicted upon the earth, that a more striking type was never exhibited of the doom which ultimately awaits it.

It is hard to conceive a more appalling sight than that which presented itself to the eyes of Noah, as he quitted the ark in which he had been immured for upwards of a year, and gazed upon the wreck of a dismantled world. That world which, at the period of its creation, had been pronounced by its Maker to be "very good," had been made, in a signal manner, subject to vanity by reason of the sin of its inhabitants. God's own sermon against that sin had been delivered; and whilst the righteous had "scarcely been saved," the ungodly had miserably perished.

So far as it is permitted us to infer from Noah's acts what was passing in his heart, we should conclude that, mingled with his emotions of gratitude for the signal mercies which he had experienced at the hands of the Lord, his first thoughts as he left the ark were thoughts of the exceeding sinfulness of sin, and of the need of atonement; for immediately after the account of his going forth from the ark, we read that "Noah builded an altar unto the Lord;" and further, that "of every clean beast, and of every clean fowl," which he had preserved with so much costly labour during the preceding year, he "offered burnt-offerings on the altar" (Gen. viii. 20).

But together with deep convictions of the evil of sin and of the long-suffering forbearance and the tender mercies of the Lord, we may scarcely doubt that anxious inquiries would arise within the breast of Noah, whether the world, thus signally consigned to the dominion of death, could ever again teem with life; and that gloomy doubts and fears would disquiet him, lest, even though man and beast should again be

multiplied upon the face of the earth, the fountains of the deep might once more be broken up, and not even eight souls escape the universal destruction.

Now it was at this time, and under these circumstances, that that God who ever mingles mercy with judgment, and who "stayeth His rough wind in the day of the east wind," was pleased to impart to Noah and to his family the gracious assurance that He would "establish His covenant" with them and with their seed, and that "all flesh should no more be cut off by the waters of a flood" (Gen. ix. 11). And forasmuch as men are ever more prone to be moved by that which appeals to their senses than by that which is a simple matter of faith, and seeing further that faith is most apt to be shaken when old temptations again assail them, and when past dangers and difficulties again threaten them, it pleased God, in His gracious condescension to human weakness and infirmity, to appoint an outward and visible sign which should serve at once to confirm their faith and to dispel their fears; and to ordain that whilst the gathering storm should serve to remind them of the destruction which overtook the world because of sin, the bow set in the clouds should assure them of the promise given to Noah, that the waters should no more become "a flood to destroy all flesh." "And God said, This is the token of the covenant which I make between me and you, and every living creature that is with you, for perpetual generations; I do set my bow in the cloud, and it shall be for a token of a covenant between me and the earth. And it shall come to pass, when I bring a cloud over the earth, that the bow shall be seen in the cloud: and I will remember my covenant which is between me and you and every living creature of all flesh; and the waters shall no more become a flood to destroy all flesh" (Gen. ix. 12-15).

It is needless to adduce any argument in proof that the reference in these verses is to the literal rainbow, and not, as was supposed in early times, to Divine Providence figuratively compared to a bow; sometimes stretched, that its arrows may pierce the adversaries; sometimes loosened, that the long-suffering of God may be accounted salvation. An inquiry of greater interest is, Whether the rainbow was first seen in the

* See "Speaker's Commentary," i. p. 78.

clouds after the Deluge, or whether, having been long visible, it was then first appointed as a sign of God's covenant with man. To this inquiry it does not appear that any positive answer can be returned. We know that in Eden, previously to the fall, "there went up a mist from the earth, and watered the whole face of the earth," or rather of the *ground* (Gen. ii. 6); and it is quite possible, although it does not appear probable, that the moisture required for vegetation continued to be thus supplied, and that it was not until after the Deluge that the material constitution of nature underwent, in this respect, any change. On the other hand, the words of Scripture, when literally rendered, "*I have set my bow in the cloud,*" suggest the conclusion, to which other considerations conduce, that the rainbow, already set in the parting cloud, was thenceforth ordained to be the outward sign and token of God's covenant with a renovated world, "the monument of past deliverance, and the pledge of future safety."

Amongst the many deep truths which the early chapters of the Book of Genesis are pre-eminently calculated to enforce, there is none which strikes the thoughtful inquirer more forcibly than does the connection between the disorder occasioned by man's sin and the remedy ordained by the wisdom and the mercy of God. Many a striking illustration of this connection may be gathered from the whole of the account of the fall, and more particularly from the promise of a Deliverer interwoven into the curse pronounced upon the serpent. The same connection may be traced, in a very remarkable manner, in the appointment of the rainbow as a sign and pledge of the covenant which God was pleased to make with Noah as the representative of a renovated world. It is well known that the rainbow is equally dependent for its existence upon the storm and upon the sunshine; and it was therefore marvellously adapted to serve as a type of mercy following upon judgment—in other words, as a sign of the connection between man's sin and God's free and unmerited grace. The appointment, then, of the rainbow as the sign and pledge of the Noachic covenant, was calculated not only to appease those emotions of terror and of apprehension which must have filled the mind of Noah as he gazed upon the spectacle of desolation which surrounded him on every side, but also to connect the gloomy recollections of the past with bright expectations of the future; or in other words, to

teach, by anticipation, the great lesson which it was reserved for Christ's gospel fully to reveal, that as sin had abounded, so grace should "much more abound."

And yet further. Not only is the rainbow, as the offspring equally of the storm and of the sunshine, a fitting emblem of the covenant of grace, of which it is one of the distinctive characteristics that it educes good out of evil, and makes man's sin the occasion for the showing forth of God's mercy; it is also a fitting type of that equally distinctive peculiarity of Christ's gospel, that sorrow and suffering have their appointed sphere of exercise both generally, in the providential administration of the world, and individually, in the growth and development of personal holiness. Other religions have enforced the lessons of patience and of submission beneath the pressure of irremediable ill. It is the gospel of Christ Jesus alone which converts sorrow and suffering into instruments for the attainment of higher and more enduring blessings.

It is well known that in the mysterious breastplate of the Jewish high-priest there were four rows of precious stones, on which were engraven the names of the twelve sons of Jacob. And it is a favourite conceit of some of the Jewish expositors that when the high-priest consulted the divine oracles by means of Urim and Thummim a supernatural light was shed upon some of these letters, by means of which the designed response was obtained. Now, in the experience of the Christian, there "ariseth in the darkness" a true light from heaven; and the response which he needs in time of trouble is offered to those who seek it, not as the exclusive privilege of one nation, or family, or individual, but as the universal birthright of each member of that "royal priesthood," which is co-extensive with Christ's universal Church. When the soul of the believer is sorely disquieted within him, and he realises in his own experience the meaning of those words of the prophet in which the condition of the Jewish Church in his own days is described, "O thou afflicted, tossed with tempest, and not comforted," the gracious and consolatory promise, delivered by the mouth of the same prophet, serves to recall to his mind not only Noah's waters of desolation, but also God's unfailing covenant of grace, "For this is as the waters of Noah unto me: for as I have sworn that the waters of Noah should no more go over the earth; so have I sworn that I would not be wroth with thee, nor rebuke thee. For the mountains shall

depart, and the hills be removed; but my kindness shall not depart from thee, neither shall the covenant of my peace be removed, saith the Lord that hath mercy on thee" (Isa. liv. 9, 10).

It is thus that in all God's dealings with His people, when He brings a cloud upon the earth He still sets His bow in that cloud, insomuch that they cease to fear when they enter into it, by reason of the presence of Him whose glory inhabits it.

The spiritual truth involved in the typical rainbow of Noah, and in the pillar of fire and of cloud which guided the march of the Israelites through the wilderness, receives further illustration from the striking imagery of the prophet Ezekiel. When the "heavens were opened" to the prophet as he sat amongst the captives by the river of Chebar, and "visions of God" were unfolded before his eyes, he "looked," we read, and "behold a whirlwind came out of the north, a great cloud, and a fire infolding itself, and a brightness was about it" (Ezek. i. 4). This vision was pre-eminently calculated to dispel the fond illusions of those who deceived their countrymen by vain hopes of outward prosperity. But whilst it spoke to some only of impending judgment, it spoke to others also of mercy. This promise of mercy after judgment is more clearly exhibited in the sequel. Above the firmament Ezekiel beheld "the likeness of a throne," and "upon the likeness of the throne, the likeness as the appearance of a man." And round about this appearance of a man we read that there was "brightness, as the appearance of the bow that is in the cloud in the day of rain" (ver. 28).

For the full comprehension of the bow, given as a sign of the covenant to Noah, and of the same bow "in the cloud in the day of rain," as beheld in vision by Ezekiel, we must turn from the Old Testament to the New. There, in the account of the visions given to another seer, we read of One whom he beheld in the midst of the throne and of the four living creatures, even "a Lamb as it had been slain" (Apoc. v. 6). Round about this throne, as about that of Ezekiel, "there was a rainbow, in sight like unto an emerald" (Apoc. iv. 3). And, in close conjunction with this vision, we must have regard to that of Apoc. x. 1, where a "mighty angel" is beheld by the same seer, "clothed with a

cloud, and a rainbow was upon his head." Here we seem to find the explanation which is needed of the close and inseparable connection between the cloud and the rainbow, *i.e.*, between judgment and mercy; between the darkness of the one and the brightness of the other. Here we obtain a key to the determination of the meaning of the prophet Ezekiel when he speaks of a "likeness, as the appearance of a man;" or, as another prophet describes a similar vision, and in the same close connection with impending judgment, "one like the Son of man, coming with the clouds of heaven," and brought near unto "the Ancient of days." (Dan. vii. 13.)

Here, in the person and in the work of the atoning Mediator, we find the only solution of that marvellous combination of judgment and of mercy which is the distinctive characteristic of the whole of the divine economy. Here, as the rainbow spans the vault of the sky and becomes a link between earth and heaven, so in the person and in the work of Christ is beheld the unchangeableness and the perpetuity of that covenant of grace which, like Jacob's mystic ladder, maintains the communication between earth and heaven, and thus, by bringing God very near to man, ushers man into the presence-chamber of God.

There is a necessary imperfection in all earthly types of heavenly things. In nature the rainbow is inseparably connected with the cloud; and although in the appearance of the rainbow *after* the storm—not *during* its continuance—we have a striking type of grace following upon, and inseparably connected with judgment, the continued appearance of the rainbow is dependent upon the continued existence of the cloud; and when the cloud is wholly dispersed, the rainbow disappears. In heaven, the rainbow, like the prints of the passion, will ever continue to point backward to man's fall, and onward to the perpetuity of a covenant which is ordered in all things and sure. But the work of judgment will then be accomplished, and therefore the cloud—inseparable from the condition of the redeemed on earth—will have no more place in heaven. The nations of the saved ones shall walk for ever in the light of the celestial city, and the clouds shall no more "return after the rain."

A LAMENT.

MY mother lies at rest beneath
The daisies and the grass ;
I listen to their whispering
And moaning as I pass,—
It seems to me they also sigh,
As I for her, alas !

But when I see the sunshine creep
Along the western wall,
It seemeth then as if her smile
Were gently healing all,
And the grass and flowers repeat, "Rejoice!"
And I hear her low voice call.

"I am content—content," she says,
"Content thou without me;
A little while, and we shall meet
In Heaven's security;
Nothing of earth shall come, my child,
Between my love and thee."

I say,— "I cannot weep, my tears
Are dried, my heart is lead ;—
If I could weep, this pain might pass,
And I could pray instead.
I cannot pray, I only moan,
And wish that I were dead.

"Take me away, O thou I love,
From this cold earth of ours ;
How can I wander all alone
Among our empty bowers !
This winter time doth only leave
The thorns without the flowers."

And then, methinks, her voice replies,—
"Daughter, I understand :—"
And through the darkness round I feel
The comfort of her hand,
Leaving less impress after it
Than waves upon the sand :—

"My child, be trustful—calm. For lo !
Sorrows in patience borne
Are like earth's briary weeds that spread
Among the ripening corn ;
While the Rose of Comfort blooms in Heaven,
A flower without a thorn."

A. C. C.

IN THE SMOKING-ROOM.

THE party at the Castle was a very pleasant one last autumn, and a few of its choicest spirits regularly met in "Tobacco Parliament" every night. The place of meeting was a snug room down-stairs, with a bright fire in the grate, and a lamp hung from the middle of a rather curiously arched roof. Here, towards midnight, one after another strolled in and took his seat, each in his favourite arm-chair. There was always "the chieftain," portly and brave, great at Gaelic and at etching, enveloped in a Mandarin's gown which he had brought home from a recent ramble round the world. There was "the envoy," as we called him, who had served his Queen in divers honourable missions abroad, and who smoked a mild cigarette, and told a good story, or listened to one, with the same mild and courtly nonchalance. In a corner near the fire, generally, sat "the minister," who had come to stay at the Castle while repairs were proceeding at the manse, and who seldom spoke much till he had smoked meditatively a couple of havanas, sent direct to him from Cuba by an old parishioner. Opposite to his was the chair appropriated by the gentleman whom, in virtue of a somewhat hazy lineal connection with a celebrated cattle-lifter of the last century, we called "Rob Roy"—a restless and fluent genius, constantly starting from his seat and declaiming on the hearth-rug, when the subject interested him. These, with myself, formed the permanent committee of the smoking-room. Others went and came; but these, like the three Christian graces, abode.

One evening I had drawn my chair near the table, on the other side of which the chief and the envoy were discussing the name of a Chinaman, of whom they both had heard.

"I assure you," said the envoy, "it ended in a whistle—a kind of double sneeze and then a whistle—so!" and he whistled softly.

The sound came back to me directly from the window, at my own side of the room. "Hallo," said I, "some one hears you outside, and has repeated the signal. I heard a whistle outside the window."

"No, pardon me," said a son of the house, who sat next me, "what you heard was the echo."

"The echo!" said I.

"The echo," he replied. "The room—owing, I suppose, to these arches in the roof—is sometimes full of echoes—a kind of

whispering-gallery. It depends on how we are sitting."

And he proceeded to make some experiments which proved the existence of several very odd and unexpected echoes.

"The room must be haunted," I said, "or, at least, it ought to be. There never was one fitter for a ghost story."

"Hush!" said the chief, as the butler came in with a tray. "Don't talk lightly of ghost stories here," he added, as old Cameron retired, "that old gentleman, and every man in the strath, believes in ghosts as firmly as in the Bible."

"Well, I don't know that," interposed the minister; "at least, I shouldn't say the belief was of exactly the same kind. They believe in the Bible, I hope, as a revelation from on high."

"And in ghosts as a revelation from another quarter, possibly?" suggested Rob Roy.

"No," continued the minister placidly, "but as facts, phenomena—call them what you please—which exist, and are known among them to exist just as well as music and dreams, and other phenomena that touch and influence the human spirit are known to exist. And I don't blame them for it," added the minister stoutly. "You may explain the phenomena, or not explain them, but you can't deny them."

"Well," said I, "I never heard what I would call an authentic ghost story yet."

"Pooh! nonsense," cried Rob Roy authoritatively; "I could tell you a dozen, but I won't begin. I have too much regard for your nerves."

"Well, I don't mind beginning," said the chief, "and simply telling you what every man, woman, and child in the parish is talking about at this very time; and that is the appearance of old Mr. Brown, the minister who died last year in Glen-Urisk. Mind, I say nothing about my own belief or disbelief, and I offer no explanations. I only tell you what the people believe, and what I was told by more than one person whose word is above suspicion."

"Let us have it," said I, with an air of scepticism, I fear.

"Proceed," said the envoy, lighting a fresh cigarette.

"One evening last month," said the chief, "as the dusk was gathering, about the gloaming, in fact, a very steady, sensible lad, well

known in the parish, dashed violently into a cottage at the foot of the glen, and with the look and voice of a person in desperate terror, asked the people to keep him safe, and not let anything in after him. What on earth should come in after him? he was asked; and when his terror and agitation had a little subsided, he told them that he had been walking quietly down the glen, about a mile away, when he became aware of a dark figure at his side keeping noiseless pace with him,—never looking at him, never speaking. He was startled, but hazarded a remark, thinking, in the dusk, it might be a stranger who had overtaken him, walking softly on the grass. He got no reply. He looked more narrowly at the figure, and knew it for the image, or *eidolon*, or ghost—whichever you please—of Mr. Brown. How he got to the cottage, he never could precisely tell; but this weird companion came with him to the door, pacing along, silent, awful, by his side. The lad was as sober as a judge. It happened a month ago, and he is only now recovering from an illness which ensued, and which, the doctor says, is traceable to a violent mental shock."

"The illness was coming on, I suppose," said I; "some sort of brain-fever, of which this vision was merely the first symptom."

"I can't tell you about that," said the chief, rather drily. "I tell you what I was told, the lad was a healthy and sober lad. He had no special connection with Mr. Brown during his life; but the *locus* of the apparition is close to the manse, and I have since been informed that it is well known in the glen that the old minister *walks*."

"That is very much the ordinary kind of ghost story," remarked the envoy, "in which the apparition may be said to appear to no good purpose. As far as you enable one to judge, I should say nothing was to be gained by giving a respectable young man a fright severe enough to induce brain-fever; and most cases of apparition one hears of are of the same character; but I know of one in which a ghost (I merely use the name for convenience) appeared for a really good and sensible object."

"That is the kind of ghost I should like to hear of," I observed.

"Very well, then," rejoined the envoy, "you shall hear of it, and I pass my word for the truth of what I state. It occurred in a family I know, and was told to me by the man concerned. He had lost his wife, and was left with three young children, all under eight years old. He grew so sick of the

house in which his wife had died that he took another—an old house in the country, and removed to it with his children. He had gone over the place himself, but the children had never seen it, and the day they arrived, they were running about, exploring, as children will, while he was in the library, arranging some books and papers. He heard one of them call to the others to 'come down this back stair,' and the patter of their feet died away as they went down; but presently he heard them come hastily back, and they ran into the library, looking rather scared. 'What's the matter?' said he, 'did you fall on the stair?' 'No, no,' said the eldest, a girl, nervously, 'it wasn't that; but when we got down near the bottom of the stair, where it is pretty dark, we saw some one standing at the foot, who told us to go back to you, papa.' 'Some one! Who was it?' he asked. 'It was rather dark,' said the little girl, 'and we did not see very plain, but—O dear, papa!'—and here she began to cry—'it was very like mamma, and the voice was mamma's voice. She held up her hand and said, "Go back, go back to papa:"' and the poor little woman sobbed bitterly, and was much upset. Well, he got a candle, and he went cautiously down the back stair, and at the foot, where they had seen the figure standing, he found a yawning trap-door, which had been closed when he went through the house before, and which covered a well—I don't know how many feet deep, but if the children had gone on, they would have inevitably fallen in and been killed."

"Is that true?" I asked.

"I don't quite know what you mean by asking," replied the envoy, mildly. "I have told the story as it was told to me by a man of perfect honour and veracity. It may possibly be susceptible of scientific explanation, similar to the medical exegesis you offered of the case of Mr. Brown; but that my friend believed the facts to be exactly as he related them to me, and that I have related them, without alteration, to you, is what I cannot admit to be open to question." The envoy spoke with a gentle firmness which, I felt, made any expression of scepticism as to the narrative little better than an outrage. "While I am on my legs," pursued the envoy, who had risen and stood by the fire, "as we used to say in the House, I may as well tell you another story which, though it relates to a dream, carries out a theory of mine as to the possibility and *rationale* of apparitions, which, to put it shortly, comes to this, that the disembodied

spirit retains the power of acting upon those spirits—still in the body—to which it has had relations in life, that it can so act upon them as to produce within the brain—which is their bodily organ—impressions corresponding to the aspect of the material structure within which the disembodied spirit used to have its own being. And if this be so, it naturally follows that we might expect such impressions to be produced at the time at which, and upon the persons to whom, the disembodied spirit would, in all likelihood, desire most to convey the impression of its continued individuality. Thus, we might imagine, in the case of death, unexpected or at a distance, such an impression—the first effort of the disembodied spirit—to be produced on the brain of the person most poignantly affected by the death. However, I don't wish to become didactic, so I shall go on with my story. Last year I was fishing in Norway; it was the 2nd of September, about the last day of my cruise, and I had landed a good way up one of the fiords to spend an hour or two on shore, leaving two men and my servant, Stokes, in the boat. Stokes was a capital fellow, the best servant I ever had; but he didn't know much about fishing, and he couldn't swim. However, after I had left the boat, to pass the time he got out a rod and went ashore to try a cast from a ledge of rock that sloped down into deep water. The men told him to take care, for the ledge was slippery; but he said it was all right, he could keep his feet; and would try if he couldn't catch a fish or two. They pushed off to some little distance, and watched him casting, rather amused at his efforts, which were by no means up to the mark of Izaak Walton, when, suddenly, as he was making a long throw, they saw him slip and fall into the water. They pulled in as hard as they could pull, but were too late. He had sunk in deep water, and they were still searching about for him when I came back. We did not get his body for more than an hour; and we buried him, next day, in a nice little Norwegian churchyard not far off. Well, when I got home, I made inquiry for his relatives, and found, as I had expected, that he had none, and that I must myself, in fact, act as his executor. I knew he had intended to marry, and so I searched among the few papers and boxes he had, for some trace of the name of the fiancée. I couldn't find any, but there was a letter which had come for him, and had been put in his room, and I opened it. It was from the girl, a very affectionate letter, but written

in great anxiety, for she told him she had had a bad dream the night before, which had troubled her much, and she hoped he was taking care of himself, and running into no danger in foreign parts. She had seen him, in her dream, coming to her looking very pale and sad, and all dripping with water 'like a drowned man,' that was her very expression. The letter was dated the 3rd of September."

"Strange," said the minister, who had listened with much attention; "and yet I don't know that it is so strange, after all. At any rate, it is not unexampled. What I am going to mention is not unlike your story, and happened long ago, before the railway era, to a cousin of mine, in India. He was a young fellow, then, in the army; and one morning came down to breakfast, looking so gloomy, that his brother officers began to chaff him about it, and badger him to tell them what mischief had befallen him during the night. He wouldn't tell them; but, after breakfast, he asked one of the fellows, who was his particular friend, to come into his bungalow, and then he disclosed what it was that had put him about. 'In the night,' he said, 'I had a very queer and unpleasant dream. I dreamed that I was standing in a park in England, looking at a large house which I never had seen before; and at the door of the house there was a hearse, and behind it half-a-dozen or so of private carriages. I saw the whole thing so plainly that I sketched the house when I awoke—there is the sketch; and I noted down the crest and motto on the panel of the first carriage. While I was looking they brought out a coffin, and put it in the hearse, and drove slowly away; and it was borne in on my mind in my dream, and I awoke with the distinct impression, that it was my father's coffin.' Well, his friend, as usual in such cases, pooh-poohed the whole affair, said he must have been looking at some sketches of English country houses, and writing home-sick letters, and taking too much brandy-pawnee. There were a dozen ways of explaining the dream, in short. His own presentiment about it, however, was not shaken. He marked down the date, and he waited anxiously for the mail of the next date after, from England. When it came, it brought him letters with black edges, which told him the date of his dream was the date of his father's funeral. The old gentleman had been travelling through England, had been thrown from the coach, and carried fatally injured into the

nearest gentleman's house, where he had died, and whence he had been carried to his burial, followed, from a feeling of sympathy and respect, by the neighbouring squires. My cousin wrote home, begging that a sketch of the house might be sent out to him. When he got it, it corresponded exactly to his own. He had already discovered that the crest and motto of the dream were those of the gentleman, who bore a well-known name, under whose roof his father had died."

"These," said the minister, eyeing me severely, "are facts as well known in my family as the fact of our own existence."

"I insinuate nothing to the contrary," said I. "I only say they pass my understanding."

"But are not on *that* account incredible," interjected Rob Roy.

"I don't know much about dreams, myself," added he. "They seem to me generally somewhat phantasmagoric, but with a vein of realism in them too. A dear friend of mine, the wife of a great metaphysician, who was for ever solving the problem of the universe, and imparting his theories to her, used to dream—it was not a solitary dream, but repeated—that she was sitting, entirely undressed, in the midst of empty space, trying to balance a grain of sand on the point of a needle."

"A distressing dream, indeed."

"Yes, but with a traceable relation to her husband's metaphysics, the same sort of relation to mental difficulty that a dream of my own, the other night, had to bodily discomfort. I dreamed that I was the weight of an enormous pendulum swinging between the top of Ben Lomond and the steeple of the Mid Kirk of Greenock. Backwards and forwards I went, top of Ben Lomond, Greenock steeple, just grazing each, till at last I hit the steeple with a tremendous bang that brought it and myself both down; and I awoke on the floor."

We all, of course, laughed at Rob Roy's remarkable "night thoughts."

"But," said the chief, "a lobster salad would account for a thing of that sort—a mere nightmare" ("the only kind of horse I keep," quoth Rob Roy, parenthetically); "but I want to tell you a story of a more unaccountable character, that was told to me last summer, in England, by a man I met at Cheltenham."

"We had made up a picnic and driven over to Tewkesbury, where we went on the river (the Avon) and rowed up three or four miles. He and I pulled one of the boats;

and after our ladies had sung some very good songs we took to telling stories. He was a capital hand at it; and I spoil this one, I am afraid, in giving it in my own version, and perhaps may vary a small detail here and there, but the bones of the thing are all there, and are the same."

The chief paused a little and blew a spiral cloud, and seemed to be recalling the pleasant windings of the Avon, and the voices of the ladies of the picnic. Then he went on, while "conticuere omnes intentique ora tenebant."

"In Cornwall, about one hundred years ago, there lived a gentleman, of good position, called John Carlyon. His place was near the river Tamar, and about twelve miles from Launceston. One night he happened to be at a town called Lostwithiel, one of these little Cornish towns, and had to dine and sleep at the inn—too late to get home, or a bad night, or something of that sort. There was only one other guest in the house, 'a commercial kind of gentleman,' the landlord said, who had also ordered dinner; and he (the landlord) could serve them both better if the dinners were combined, if Mr. Carlyon did not object.

"Mr. Carlyon had no objection whatever. The dinners were combined, and the commercial gentleman proved most talkative and agreeable; so much so that Carlyon, who knew the house, insisted on standing a bottle or two of a very special claret which the landlord was not in the habit of producing for commercial gents. The wine was paid for by Carlyon, though entered in the bill, the rest of which they paid equally. The conversation was something like ours to-night, only of a more serious cast, embracing the general question of a spiritual world, and the possibility of supernatural manifestations. Carlyon was disposed to scepticism on this head; the other was a steady believer, and argued his side of the question so well, that Carlyon afterwards noted down some of his points in a notebook which he carried in his pocket, to think them over at leisure.

"Some months after this the assizes were held at Launceston. He rode over to see the court opened, but did not remain long. People were talking about a case of murder; but he had not heard much about it, and did not care to stay, so went home and dined. It was, I think, in October—at any rate when the evenings are shortening. He had gone to his study, and was sitting there, about nine o'clock or so, when he heard the noise

of a horse being led under the window, and then up and down on the gravel before the door. He threw open the window and cried, 'Who's there?' The voice of his own groom replied, 'It's me, sir, with the mare.' 'The mare! Who wants the mare?' 'Why, sir, didn't you send to tell me to bring her round?' 'Not I. I never sent to tell you to bring her round.' 'Well, sir, all I know is that somebody tapped at my window five minutes ago, and said I was to make haste and bring round the mare, for you were going back to the 'sizes at Launceston.' 'Who was it?' 'I didn't see, sir.' 'Well, you would know the voice.' 'Well, sir, now that you speak of it, I did not. It seemed to me a kind of foreigner's voice.' In Cornwall they call a man who doesn't belong to the county a 'foreigner.'

"Well, the upshot of the colloquy was that Carlyon ordered the groom to take the mare back to the stable, as somebody had been playing him a trick; and he shut the window. As he turned from it to sit down his eye fell on his pocket-book, which lay on the table, and in it he saw the notes of his conversation with the 'commercial gentleman' at Lostwithiel. The words his eye caught were to this effect:—'The spiritual may communicate itself visibly or audibly.' A connection between this idea and the arrival of the mare flashed into his mind. He sprang back, threw open the window again, and hallooed to the groom to bring her round. 'I shall go to Launceston, after all,' he said. And he mounted and set off at a round pace. 'It's a fool's errand, I suspect,' he said to himself; 'but we shall see.'

"Now, a few miles from his house he had to get across the Tamar by a ferry, and the boatman lived on the farther side; and at night it was often a difficult and slow business to rouse him out and get him over, and generally involved a good deal of shouting. Well, when Carlyon rode up to the river, there was the boat on the right side and the man waiting. 'I got your message just in time, Mr. Carlyon,' said the man. 'What message?' 'Why, the message that you were coming, and that I was to cross to meet you.' 'Who told you that?' asked Carlyon. 'He must have crossed the river too.' 'Well, if he did, it wasn't in my boat,' said the ferryman; 'but somebody tapped at my window about a quarter of an hour since, and said you were coming to Launceston, and I was to cross for you.' 'Did you know the voice?' 'No. It was a kind of foreign voice,' said the man.

"Carlyon rode off from the ferry faster than before—so fast, in fact, that nobody, unless unusually well mounted, could have kept up with him. He knew that before he entered Launceston he should have to pass a toll-bar kept by surly old 'pike,' who was slow to open his gate, or fumble out his change at night. 'I'll be kept waiting here,' he thought, as he came to it. But no: the old fellow was standing at the gate, holding it open. 'Is that you, Mr. Carlyon?' he said. 'I hope I may shut up for the night now.' 'Were you expecting me?' asked Carlyon. 'To be sure I was, after your message.' And then followed the same explanation—the 'foreign' voice and so on.

The same thing on riding into Launceston. "In those days, I believe, they had to sit till they finished a criminal case at the assizes; and as the murder trial was still dragging on, there was a bit of a crowd round the door of the courthouse. But a man stepped forward and said, 'All right, sir. I'm here for the mare.' He was a groom from the inn, and he too had got the message,—Mr. Carlyon was coming; he was to go over to the courthouse for his horse; and he too quoted the 'foreign' voice again.

"All this is very queer," thought Carlyon; 'but I shall see if I can find a clue to it in the courthouse.' He went in, and was at once accosted by the crier of the court (or whoever it is that looks after the witnesses) with 'Come away, Mr. Carlyon, unless you can do something for him, the case is pretty nigh over now. He says he depends on your evidence.' 'My evidence,' said Carlyon. 'I know nothing about it;' and he was proceeding to protest against being implicated in any way, when he was cut short by being summarily ushered into the witness-box and sworn. There was a haggard prisoner at the bar, dimly seen by the smoky candle-lights, amidst the crowded court. 'Be so good as look at the prisoner at the bar,' said the prisoner's counsel, 'and tell me if you know him.' Carlyon looked, 'I do not,' he said. 'Look again,' said the prisoner himself. Carlyon started. He seemed to know the voice. He looked again. A candle was held close to the prisoner's face. It was the 'commercial gentleman' he had dined with, at Lostwithiel. 'I do know him,' said Carlyon; 'I remember him now, perfectly.' 'Where did you see him last?' 'At the inn at Lostwithiel.' 'When?' Carlyon could not recall the date. He was asked if he could in any way identify the time. He could not; his notes of the conversation bore no

date. 'Do you recognise that?' said the counsel, handing up a paper. It was the bill for the dinner and the claret. Of course he identified it; and swore that on the day on which that bill was dated, he had dined with the prisoner at the bar, in the inn at Lostwithiel. It was the date of the murder with which the prisoner was charged. 'Let me see the bill,' said the judge; and it was handed to the bench. 'Nothing more is needed,' said the judge. The evidence of *alibi* is complete. Let the prisoner be discharged.'

The chief ceased.

"Well?" said we all.

"Well," said he, "what would you have more? That is the story."

"But is there no explanation of the voice?"

"Not the slightest."

"Who was the foreigner?"

"Ah! who, indeed? The history adds no more."

"Does it not explain," I asked, "how Carlyon did not know he was to be a witness in the case?"

"Not as I heard it told," replied the chief. "That is a mere question of detail. You must take it as I got it; and according to my informant, it is recorded among the archives of Carlyon's family, in Carlyon's own handwriting and words, and is beyond dispute authentic."

"Well," said I, "don't tell us any more. My belief as to the possible and the impossible, the natural and the supernatural, is getting too much shaken for one night. Prithee forbear."

"Not," said Rob Roy, springing to the hearth-rug, "till you have heard *my* story."

"Is it a very strong one?" I asked.

"You shall hear for yourself," said he, with some solemnity; "but before I begin, let me beg you not to use again the term 'supernatural,' until you are certain that your knowledge embraces every phase and potency in nature; and as to the 'impossible,' allow me to say with Mirabeau, 'Ne me dites jamais ce bête de mot.'"

Rob Roy having thus abolished me, proceeded sonorously, "Some years ago, at the beginning of the long vacation, three young Oxonians were debating where they should go to spend their time. One voted for Wales, another for Scotland, another for a cruise in the Channel. At last, a friend who was with them said, 'I tell you what to do. Go down to Scotland, and put up for a month at my place in Ross-shire. I can't go myself;

and it needn't stand empty. You can fish, or shoot, or do what you like. It's a good enough old house, and you can make yourselves very comfortable. I only give you one caution—don't sleep in the haunted room.' The offer was accepted at once: some jokes were cut at the haunted room; and in a day or two the three went north, and duly reached the place in Ross-shire. They found an old man in charge, who showed them over the house, and pointed out three very good bed-rooms, where they were to sleep. 'But where is the haunted room?' said they. 'The haunted room, gentlemen!' said Mackenzie—(that was the ancient's name). 'Oh! there's no haunted room. Who's been telling you stories about haunted rooms? Nobody ever heard tell of such a thing here.' However, they persisted; and after a great deal of finessing, he admitted that he had heard some 'idle clavers' about one of the rooms. He could show them the room, if they liked, but it wasn't fit for a gentleman to sleep in. It was damp, and all out of order, &c. However, he took them to the room—an undeniably dull and disused-looking chamber it was. 'Ye see, gentlemen, it wouldn't do,' said he persuasively. 'But it will do,' was the answer. 'We'll try it for a night, at any rate; so you get it ready, Mackenzie, and no more about it.' And, after many remonstrances, Mackenzie had no alternative but to put in a fire, and 'redd up' the room a little for the night. Between ten and eleven o'clock they all went up to it, and began their vigil. The room, however, was not attractive. The chairs were hard, there was a draught from the window. The smoking-room down-stairs was a gem—as snug as this one. By-and-by, they began to feel rather bored. 'Well, do you know,' said one, 'this is all very well, but I'd rather be in the smoking-room. Let's go down, for a while, at least.' 'All right,' said another; 'this is decidedly slow. I don't believe in sitting up in haunted rooms. Come along.' 'No,' said the third; 'I'm going to sit it out. You two go, if you like; but leave me here.' He was obstinate about it, so the other two agreed to go and leave him alone. 'Sit up in the smoking-room,' he said, 'till two o'clock, and if you hear nothing before that, you can go to bed, and conclude I'm all right.' Down they went, and began to smoke and chat. Twelve o'clock passed; one o'clock passed. 'Hang it,' said one of them yawning, 'I suppose we must wait till two; but I am getting fearfully inclined to go to bed, ghosts or no

ghosts.' Scarcely were the words uttered when 'tingle, lingle, lingle,' a tremendous peal of the bell—of the bell rung frantically, passionately, continuously.

They started to their feet, and stared at each other for a moment 'with a wild surmise,' then rushed up-stairs, the bell pealing till they were half-way up, then an awful silence. The door of the room was shut; they threw it open and sprang in. What they saw was this," and as he spoke, Rob Roy, with a rapid movement, drew his black hair over his forehead, and with eyes wildly staring, crouched down, with his back against the wall, and stretching out quivering hands that pointed to some horror invisible to us, screamed, in a tone of terror that made us all jump, "there it is, there it is; take it away, take it *away*, take it AWAY, u—ugh!"

Then resuming his natural position and voice, he added gravely, as he stepped forward and laid his hand impressively on the table,—“A raging maniac. *A raging maniac.* And, what is more, that man is to this day and hour, a raging maniac, in a lunatic asylum.”

We were all rather startled. Rob Roy told and acted the whole thing so dramatically, that it impressed us as a reality.

“I have heard that story before,” said the minister, “and it is a true one; but the horror of it is its indefiniteness. It leaves so much to the imagination. You keep picturing to yourself what it could be that he saw.”

“Yes,” said I, “but might he not have so excited himself by anticipating some horror that at last his brain played him a trick?”

“Oh, he might possibly,” said Rob Roy, rather derisively. “It is open to any explanation you please. I am only responsible for the facts, not for the interpretation.”

“Allons donc,” said the envoy, “it is now 1.30, and I wish to get some sleep. I don’t think, after that narrative, that I am likely to get much, but I must try to get some, so let us go up-stairs. “I think,” he added, suggestively, “we all go the same way;” and I confess I felt rather pleased that I had not to thread any of the dark passages alone.

S.

A CASE OF CAMEOS.

AGATE.

FIRST, on an Agate-stone, a Centaur strong,
With square man-breasts and hide of dapple-dun,
His brown arms bound behind him with a thong,
Strove, on strained croup, to free himself from one,—
A better rider than Bellerophon.*
For, on his back, by some strange power of art,
There sat a laughing Boy with bow and dart,
Who drove him where he would, and driving him,
With that barbed toy would make him rear and start.
To this was writ “World-victor” on the rim.

CHALCEDONY.

The next in legend bid—“Beware of show!”
’Twas graven this on white Chalcedony.
Here great APOLLO, with unbended bow,—
His quiver hard by on a laurel-tree,—
For some new theft was rating MERCURY.
Who stood with downcast eyes and feigned distress,
As daring not for utter guiltiness
To meet that angry voice and aspect joined.
His very heel-wings drooped; but yet, not less,
His backward hand the Sun-God’s shafts purloined.

* “Equus ipso melior Bellerophonte.”—HOR. iii. 12.

SARDONYX.

Then, on a Sardonyx, the man of Thrace,—
 The VOICE supreme that through Hell's portals stole,—
 With carved white lyre, and glorious song-lit face,
 (Too soon, alas ! on Hebrus' wave to roll !)
 Played to the beasts, from a great elm-tree bole.
 And lo ! with half-shut eyes the leopard spread
 His lissome length ; and deer with gentle tread
 Came through the trees ; and, from a nearer spring,
 The prick-eared rabbit paused ; while overhead
 The stock-dove drifted downward, fluttering.

AMETHYST.

Next came an Amethyst,—the grape in hue.
 On a mock throne, by flesh excess disgraced,
 With heavy head, and thyrsus held askew,
 The Youths, in scorn, had dull SILENUS placed,
 And o'er him " King of Topers " they had traced.
 Yet, but a King of Sleep he seemed at best,
 With wine-bag cheeks that bulged upon his breast,
 And vat-like paunch distent from his carouse.
 Therenigh, his ass, by no respect repressed,
 Munched at the wreath upon her Master's brows.

EMERALD.

Lastly with " Pleasure " was an Emerald graven,
 Dark-hued,—divine. Thereon the SIRENS sung.
 What time, beneath, by rough rock-bases caven,
 And jaw-like rifts where many a green bone clung,
 The full flood-tide, in-rushing, coiled and swung.
 Then,—in the offing,—on the lift of the sea,
 A strong ship drawing shoreward, helplessly.
 For, from the prow, e'en now the rowers leap
 Headlong, nor call on any deity—
 Ah me, those Woman-witches of the Deep !

AUSTIN DOBSON.

PHILANTHROPIC WORK IN BIRMINGHAM.

SOME time since the present writer was in a little company which contained a few ministers of the Gospel, and in the course of conversation the subject of late coming to morning service chanced to be alluded to. All had observed how inveterate the habit was and how difficult to overcome. One recommended this thing, another that ; but to each some objection was started, and at length it was agreed that the best that could be done to minimise the evil was rigorously to close the doors and admit late comers only between the earlier parts of the service, when a short interval might be allowed for the finding of seats. As an illustration of the way in which rooted habits might be overcome by strong inducements, a gentleman present afterwards told how, being in Birmingham and having occasion to go from one part of the town to another between seven and eight on a Sunday morning, he was surprised, on reaching a certain street,

to find that it was not like the others, dull and silent; but that group on group of men, clearly working men, were making their way quickly towards one point. His curiosity was excited, and he asked the reason. He was told that these men were the scholars going to the Quaker's First-Day Schools at Severn Street, that many hundreds of men attended them, and for this purpose, in spite of the strong temptation to lie in bed, arose almost as early on Sundays as on week-days, in winter as in summer. The gentleman made further inquiries and had got possession of certain facts regarding the schools—the hearing of which was sufficient to make the writer form a resolution to see this work for himself at the earliest opportunity. From various causes a visit to Birmingham was deferred month by month; but on a Sunday in April last, he was able to realise his wish, and is now desirous to give the readers of *GOOD WORDS* a general idea of what he saw in Severn Street.

The morning was sharp and cold, and the district through which the larger part of his route lay was not inviting. Outward appearance told too plainly the prevailing habits of the classes dwelling there—dingy narrowish streets, with many alleys leading off them, and the peculiar damp stale odours inseparable from the close herding of human beings. But here too public-houses looked brilliant, even before the shutters were removed. It was a relief when the writer found himself in a little room with a cheerful company seated round narrow tables at tea. These were the Severn Street teachers, numbering over thirty, some of whom for a quarter of a century have never breakfasted elsewhere on Sunday morning unless absent from home or confined to bed. Here any topic of more than ordinary interest relating to the schools is talked over, and we may depend upon it that this little weekly social meeting promotes unity and brotherliness in a high degree. A chapter of Scripture read and a blessing asked on the work about to be entered on, close this meeting; and then we are asked to follow one of the teachers to the First Class. We are caught in a living stream as we go. Some of the men are in Sunday clothes, others in clean working clothes, and many carry books. The sound of their march is like the tramp of a regiment. We soon find ourselves in a large well-built room, with two rows of tables running from end to end, the men seated on forms round each, and free passage-way between. The walls are painted and slightly ornamented, and here and there

are inscribed such scripture texts as "Let brotherly love continue." At one end is a portrait, of the faithfulness of which we can judge by the living face at our side. It was subscribed for by the scholars; and the room itself, we are told, was furnished by them at a cost of about £120. In all, there are over two hundred and fifty men in this class.

We observe that those on the one side are getting a reading lesson from the Bible, and those on the other are engaged in writing, their copies being invariably a text of scripture or a few lines from a hymn. The classes are divided into central and elementary. The central are those which are so advanced as to require a really educated teacher, and occupy the space to either side of the raised reading-desk in the middle opposite the door; the elementary are those to which a more advanced scholar can be drafted as a teacher. We walk round the room in the company of one who was himself a scholar here, and who gives us a very concise and interesting account of the place, with many references to his own experience. We find, of course, some of the men in the central sections considerably advanced. They write well and freely, and read with great correctness, and with much of that deliberate enunciation characteristic of their teachers. Others there are in the elementary department who are but beginners, and to whom as yet the exercise is only labour, but who have heart kept in them by the knowledge of what others have done and the kindly patience of their teachers. Some, though they have been at the school for years, are still cramped and constrained and write with difficulty, for they are dull in brain and the one hour's practice in the week is too little. But, once engaged, they manfully struggle on. It is indeed touching to hear how the attachments to the school grow and deepen. Several of the men told us, with a glad twinkle of the eye, that they could not give up Severn Street. You might as well ask them to give up their "daily food,"—it was just as necessary to them now as that was. One man, who charges himself with the giving out and taking in of the library books for one of the classes, said, "We would feel like fish out of water all the week, if we didn't come to Severn Street on Sunday; wouldn't we, Bill?" he urged, referring to a companion. "We are rough fellows; but Severn Street rubs down our angles and gives us a facing, and I hope," he went on, with an access of seriousness, "it prepares us for the duty of this life and gives us hopes for another."

The school lasts for two hours—from half past seven to half past nine. At half past eight the sections exchange places, those who have been writing now begin to read, and those who have been reading begin to write—a passage of Scripture having been read after the change of places. The same general order applies to the other classes—some of which meet in a larger but older and more irregular building, containing above three hundred men. Over the superintendent's raised desk in this room is a portrait of Joseph Sturge—full of benevolent wisdom and calm peace, and underneath are the words:—

"This Memorial was raised by the
Voluntary Contributions
of the scholars in the Adult Division of
SEVERN STREET FIRST-DAY SCHOOL,
in affectionate remembrance of their esteemed friend
and benefactor,

JOSEPH STURGE.
January, 1861."

As a companion there is another portrait on the other side, and under it we read:—

"This portrait of
JOSEPH CLARK
was subscribed for by the scholars of
Severn Street School,
as a token of their esteem and high appreciation of
his valued labours as Superintendent during
a period of nearly twenty years.
May, 1864."

We go on from hall to hall, all crowded—very much interested in one room devoted to the juniors, lads under seventeen years of age, where a great and most interesting work is being done. To each of the classes is attached a library consisting of the best class of books—not all strictly religious, but all having a pure and elevating tendency—such as Hugh Miller's writings, Livingstone's travels, Tennyson's poems, and the better style of fiction and magazines. Each man may subscribe 3*d*. a month for library and dispensary ticket, but this is not in any way made a condition of entering the school, or of continuing in it, though it is pleasant to know that with rare exceptions the men do all voluntarily subscribe.

The schools have now extended so that several of the classes meet at a little distance from the original station. A very large building has been erected at Priory Lane for a girls' school, where we saw nearly five hundred scholars assembled, divided into classes as in the case of the men. It was one of the most impressive sights we have ever seen—the utter quietness and attention

of the pupils, and the marked ability and tact of the teachers all claiming notice. Here, however, there is more of the Bible-class element, as it is found quite practicable to give the girls their writing instruction in classes on the Monday evenings in the same place.

As we walked through the various classrooms we observed that in every point the organization was so complete that a vast amount of work was done in a manner almost unnoticed. For example, we saw men step forward, and insert little slips in boxes hung near the door in each room. These boxes are somewhat like what are used in offices for letters for post and delivery, but with many divisions numbered by figures. The slips were the reports of those who had visited absentees from the school. By this system a man who has once been entered at Severn Street Schools is not lost sight of. He is waited on, and if it should be found that he is sick, and if his circumstances are such as to demand it, he is, on the report of the visitor, relieved from the Benevolent Fund, and in such a way that the fact is only known to a small committee. If, on the other hand, it should happen that he absents himself, as has sometimes been the case, because he is hopeless of getting on, or because he has become tired of it, or has got once more among old companions, he is quietly reasoned with, and generally, from the considerate and brotherly way in which he is treated, a fresh tie is formed between him and the school. In not a few cases the influence of the visitor has been added to that of the man's wife in its favour; for we should not forget to state that wives and children very soon come to appreciate Severn Street, because they soon share in its benefits. In order to get up early on the Sunday morning, Saturday night must be spent in a quiet and rational manner; and we can easily believe what we have been told, that very soon Severn Street scholars begin to find that they can be comfortable, and still save a little out of earnings which used to be absorbed before they were earned. Hence we find that the treasurer of the savings-bank—a most important part of the work—is present, Sunday morning though it be, to take the money which the scholars have brought with them to deposit in his hands; and we have no doubt that our readers will be as surprised as we were to learn that from the 1,400 attending these classes he has at present some £7,000, and that there are members of the classes who have amounts at their

credit varying from £100 to £500. There are few, we understood, who had not something deposited in his hands.

And it should not for a moment be imagined that these men are generally, or even to a large extent, skilled workmen earning big wages. There may be a sprinkling of these; but the bulk are unskilled workers, whose earnings are not large. Nay, there is a proportion of these scholars, now so clean and eager at their lessons, who were distinctly of the dangerous classes. Some of them were professional pugilists, others dog-fighters and dog-fanciers, some, again, were pigeon-fliers and incorrigible idlers, if not worse; and many were notorious drunkards. It is not, therefore, to be wondered at that a Temperance Society and a Band of Hope is a much-encouraged branch of the work. Men who are now in good positions, employing many hands, and not only looked up to by their fellow citizens, but entrusted with their suffrages, are pleased and proud to acknowledge that all they have and all they are they owe to the Severn Street Schools. It is precisely the kind of work which makes one eager to know its origin and history; and we shall now try to satisfy a natural curiosity on that head.

The late Mr. Joseph Sturge, moved to his very heart at seeing so many men hanging idle about the corners of the streets on the first day of the week, dirty, unkempt, and often more or less drunk, asked himself whether it was not possible to do something for them—to take them and teach them something. He mentioned the matter to some friends: the proposal was heartily taken up, and the men were asked to come to a room on the Sunday afternoon. At first (in the end of 1845) only a few could be tempted by the bait of being taught; but Mr. Sturge knew that if he could only get a few to come and to carry away the benefits even of an elementary education, they would soon proclaim the advantages of the school, and bring crowds of scholars. He stood firm in his purpose, in face of many discouragements; he went out and begged the men to come in; and at last the result justified his decision. The following table shows the rate of progress:—

		Teachers.	Scholars.
Average attendance during	1846	13	39
"	" 1855	24	251
"	" 1865	32	481
"	" 1875	44	1,249
"	" 1876	45	1,400

When, for several reasons, the hour was

in 1847 changed from the afternoon to early morning, it was feared by some that the attendance would fall off. Instead of that, it has gone on steadily increasing; and its effect in stimulating the activity of other churches in the same direction has, year by year, become more marked. There is scarcely a church in Birmingham which has not now its adult school,—a large one being in connection with Mr. Dale's congregation at Carr's Lane—Mr. Thornton, the late Bishop of Ballarat, having made an earnest effort to introduce it in the Church of England. And it is a most remarkable fact that no sooner have the men made a fair start at Severn Street than they become so eager to make progress, that in many cases their afternoon is also devoted to the same purpose at one or other of the schools which meet then—the Farm-Street Bible-classes, with their three hundred scholars, including many such.

We are well aware that the very thing which we may assume to have chiefly ensured this great success is precisely that to which not a few good men and women might be inclined to take exception. We mean the aspect of secularity which is presented at the first view. The Severn Street Schools are not ostensibly religious schools. The first object is professedly to teach poor ignorant men to read and write. There is no preaching, nor is there any effort at hard-and-fast doctrinal commentary, though the only book used for reading is the Bible. But there is often a great deal in an atmosphere; and the atmosphere of Severn Street is religious in the highest sense. The men soon feel that one interest alone sustains the teachers in their work, and that is, an earnest desire for their welfare. Nothing acts on men of the working class like this. It is doubtful indeed if the same religious work could have been done if the religious end had been distinctly thrust forward at the outset, or if the original plan had been in any way departed from. It is by a spirit of constant self-denial and of tender consideration for those taught by them, that the teachers of Severn Street have gained their large and deepening influence; and if they have not found it desirable to place a distinctly religious purpose in the forefront of their work, we may be sure of this, that only the deepest religious convictions could have sustained them in it. It is perhaps only a good illustration of that "becoming all things to all men to gain some" which was the characteristic attainment of the Apostle of the Gentiles;

and we have at hand ready proofs that if the work is to be judged by its fruits, they have not failed in this, the highest aspect in which such work can be viewed. As we walked along from the main schoolrooms to one of those at a little distance, our guide told us of one out of many most striking cases confirmatory of this position, though he had mainly in view its pathos and sentiment. A man who had at one time been a confirmed evil-doer, who trained dogs for fighting purposes, and wished nothing for his children but to follow in his footsteps, was in the most unexpected way brought into contact with one of the teachers at Severn Street. He was prevailed on to go to school, and afterwards attended regularly. He sought stated work after a time, and by-and-by began to be exercised about the question of keeping some dogs he had reared. One of these was a bull-dog, for which he could at any moment have got a good price. The dog had been a great pet; and he was unwilling to part with it. But the stronger the attraction of Severn Street became, the more distressing the conflict that raged in his breast. At length, he came to a conclusion. One Sunday morning he called his son—whom before he had aimed only at training to his own evil ways—and said to him, "Tom, I can't keep the bull-dog and go to school at the same time; and I can't see as it would be right for me to sell it, to be used by others for what I see now is wrong, and what I wouldn't do myself. So you come to the pump and I'll hold him under the water, and we'll be done with it." And so, at a time when the money would have been a decided prize, he sacrificed the dog; and one can well imagine the conflict of his feelings as he did it for duty's sake. But it was done. He fell ill some months afterwards, and died in peace before the year was out. His two sons are now teachers in Severn Street.

Another little anecdote learned from the lips of one of the teachers may be given:—

"About twenty years ago three or four men were sitting in a public-house smoking their pipes, when one of them said,—

"I wish I knew how to write a bit better, our gaffer would have give me five shillings a week more because he wants me to keep account of the work give out to the other men; I'd give a shilling a week to anybody as would teach me to write."

"Oh, I can tell you where you can learn to write for nothing," said another, "the Quakers have got a school at Severn Street, of a Sunday morning, and anybody as likes can go."

"Ah, that's the shop for me. What time is it held?"

"Pretty early, I think—seven or half-past."

"Ah, I couldn't stand that of a Sunday morning. I like to lay a bed a bit later then."

"And yet you said you wanted to learn to write. Now I say, let's all go for the lark of the thing."

"So we will," all replied.

"They were accordingly admitted, and continued to attend regularly. Two of them were induced to deposit money in the savings' fund, their houses improved, and the wives, as usual, spoke highly of the good effects of the school. One of them getting a little irregular in his attendance, was visited by his teacher. He made various excuses which the teacher felt were not the real reasons. At last, he said,—

"Well, the fact is, you pitches it so precious religious at your school. I didn't go to learn religion, only writing."

"The teacher, a little taken aback, replied,—

"Well, we don't profess to be very clever hands at teaching anything, but we try to do our best; but let me ask, do you think anything we teach would be likely to do harm to any man? Would it make him a worse husband, or father, or neighbour? Would it make him less sober, or hurt him in his daily work, or make wages any lower?"

"Oh, no, of course not; for the matter of that, if we was to mind more what you told us, we should all be the better for it."

"After a little more talk the man said,—

"I think I shall come again, regular."

"He did so, and is now a prosperous manufacturer, employing many hands."

One or two further quotations from the records of Severn Street Schools may be welcome. These are extracts from letters or speeches of scholars:—

"If I were to try to name all the good I have got from attending school, I should certainly fill a great quantity of paper. One great benefit I will name is—the early time at which the school is held, which does not shorten the day for other duties, and which has led me and others into better habits than lazy lie-a-bed ways in which so many used to spend their sabbath. It was through my coming to school I was led to attend regularly at a place of worship—as before I came to school I seldom or never did, and I have since been admitted into a Christian church, and try to help some less favoured than myself to learn to read God's Holy Word."

"I used to think the Quakers, as we call them, was a queer outlandish sort of people, and uncommon fond of money, but who didn't trouble their heads about other people much. But, I think different now. You'll be saying, dear teacher, that we must not thank the clouds for rain; but these clouds, the Friends, have rained so much good into me, through Severn Street, that I can't help thanking them. Our teachers don't set themselves up like some do—but they come down to us and try and pick us up out of the dirt and mire of sin. You know what deep mire I have come up out of, and I pray every day to feel quite firm on the Rock, Christ Jesus. . . . It seems a strange thing to me to write about religion, but I really do feel a little of it in my heart, and it is out of the heart the mouth speaks, and the pen writes."

"It is wonderful to me to be able to write a letter to my dear teacher; but I am able in some sort of

way. What a glorious place Severn Street First-Day School has been to me, and a many beside. To think that any poor chap, however far gone in what is bad, may come to that school and find friends to welcome him—and not mind how poor he is—and stick to him till they have helped him to mend his ways. So every day my wife and me are talking about the school, and saying it's the grandest thing in Birmingham for work; it don't turn them into paupers when they go there, but very often into gentlemen, compared with what they were before; and when they have learned to profit from the beautiful lessons out of the Bible, there is no saying how far in good a man may go, by the blessing of God."

"If I don't get up, dear fellow-scholars, and just say a few words about the good I have got from coming to school, my missus will, for she's been elbowing me a good bit. If ever anybody has reason to speak good of coming to school—it's me. Me and my wife was never so happy and comfortable in our lives. I mean to persevere in coming, for I want to learn to read my Bible. It seems such a thing for a man with children about him to hear them reading it, and their father not be able. It's the drink, friends, more than anything else, that keeps men down. Since I've give it up, I seem to have better thoughts and better feelings, and it's my desire that God Almighty may bless our school and all belonging to it."

"Soon after I came to school, I found there was a good many things to do in this world that I had never thought of before. One thing I saw very plain, was, that if I meant to stop in the school I must give up the drink. It was a hardish job at first, but by the blessing of God I overcame. One Sunday, as I was going along the street, I met some of my old companions. Now I had never been ashamed to be seen going into a public-house with them, but I did feel a little ashamed now, for I was going to chapel; when they called out for me to go with them in some spree or other; and, thinks I to myself, now is my time, or never, to show which side I'm on. Here goes! and with that, I run up the steps and into the chapel, and when I was inside the door, I felt safe and happy. I'm always thinking about the school, and it's about the best day's work I ever done to come to it, and one I shall never repent of as long as I live."

The Schools are supported by the subscriptions of Friends, some of the rooms are the ordinary schoolrooms of the British Society; but the room in which the First Class meets has been built for the purpose, and also the Priory Street Girls' School, at an expense of nearly £3,000—almost all raised by members of the Society. In the last Report of the Schools we read:—

"We are glad that the Central Committee of the First-day School Association has appealed to the members of our Society, through the quarterly meetings, to consider whether a further extension of First-day Schools may not be attempted. We believe that, under the Divine blessing, associations of this kind, where those who attend are banded together for mutual improvement, have been instrumental in

strengthening that which is good and true, and in repressing that which is vicious and false. . . . There is no obstacle, we believe, to prevent all the board schoolrooms being utilised in a similar manner on First-day mornings."

Is it not possible that in so good a cause, and one which has been proved so practicable in the right hands, something in the same direction could be done in other large towns to utilise the Board Schoolrooms on Sunday mornings, now waiting for such a purpose? We do earnestly hope that adult schools may soon spring up in many places.

Another enterprise of a somewhat different kind, but also aimed chiefly at the elevation of the working classes, claimed our attention before leaving Birmingham. As most readers are no doubt aware, Birmingham has gained, next after Manchester, the credit for wise and effective working of the Free Libraries Act. Any one stepping into the handsome, elevated, well-lighted building, beside the town-hall, which is devoted to this purpose, would be likely to feel at once that such credit must be well deserved. Here we find a lower reading-room, well stocked with daily and weekly newspapers and magazines, the lofty walls clothed with volumes forming a lending library, and a free space round in front of a counter where books are given out; then, right above that, up a wide flight of stairs, is another reading-room, with the more select newspapers and reviews; the side space being used precisely as below, for the purposes of a reference library. From nine in the morning till ten at night a ceaseless stream is to be seen going out and in, the greatest flow taking place at dinner-time, and shortly after the closing hour of factories and works in the evening. Though the bulk of those we see here are clearly working men, the reading-room at a first-class club could not be more quiet and orderly. On asking one of the Librarians whether newspapers or magazines were ever stolen, he said very seldom, perhaps half-a-dozen papers in the course of the year, and two or three magazines. And he went on to tell us, what at first might appear odd, but on second thoughts will only be regarded as natural, that generally, it is on a Saturday night that magazines disappear, and that in most instances they are replaced on the Monday. The closing moment comes, and the attraction of some striking incident, or curiosity in the fate of some character, proves too strong. The magazine goes into the coat pocket that the story may be finished at home quietly. The *Cornhill*, *Good Words*, the *Sunday Magazine*,

and the *Argosy*, have all undergone this exposure, or say rather have reached this honour. Even in the few cases where magazines have not been returned the librarian would attribute this rather to the circumstance just noted, than to any thievish propensity; the offenders having found it out of their power to make restitution in time.

To procure the right of reading from the lending library all that is required is a form filled up by a burgess of the town: the books of the reference library must, of course, be used in the room. We found here in every respect, a fine and useful collection, including many rare works such as are now seldom to be bought, and are warmly competed for when they are offered for sale. Especially were we attracted by a whole Cervantes Library, presented by Mr. Bragge a year ago, containing every edition of the Spanish classic ever issued in any language. In some instances these more valuable books have been purchased, and in others presented, as the Cervantes library was.

Besides this central library, there are in the neighbourhood of Birmingham four branches; and the number of volumes in the central and reference library, at the end of 1874 was 51,884, while the branch libraries had 22,102 volumes. As to circulation, the Report of 1874 says:—

“Taking all the issues of books together, in the central and the branch libraries, the increase in the total as compared with the total for 1873 is only small, the aggregate number of issues being 542,887 in 1874, as against 539,822 in 1873. It is very satisfactory, however, to note that in the issues of books to readers in the Reference Library, there has been a marked increase, thus indicating the growing use of a higher class of works than are deposited in the lending libraries, and showing that the free-library system is bearing fruit in raising the standard of taste and cultivation amongst readers. The whole number of issues in the Reference Library in 1874 was 211,023, as against 187,044 in 1873. The Committee regard this magnificent total—the issue of more than half a million of books during one year—as a convincing proof of the wisdom of establishing the free-library system in Birmingham, and of the appreciation in which this great educational benefit is held by the inhabitants. In no other way could such vast stores of literature have been rendered accessible to all classes of the population, even to the humblest; by no other means could such a taste for reading have been developed among the many thousands who use the libraries, not as a matter of charity or favour, but with the sense of possession and ownership which grows out of their entirely free and public management and character.”

In all this immense circulation, we find that in the course of 1874 only 39 volumes were lost, which is not much beyond the casualties which may be anticipated in the conduct of a subscription library of like

extent. The art galleries in connection with the libraries are good, and must exercise an elevating and refining effect of the most marked kind. Indeed we cannot conceive of men making a habit of spending much of their spare time in these buildings, and not very soon becoming impatient of that which is coarse, not to say degrading and brutal. The penny rate must before very long have repaid itself, and the generosity which accepted the Free Libraries Act have proved economical. Why is it that so many large towns still decline to accept the powers which the Act would confer upon them to raise and to cultivate the inhabitants? The good result is no longer theory, but ascertained fact, as Manchester and Birmingham abundantly prove, not to speak of the rapidly-spreading free libraries in smaller towns. Round Birmingham alone, Bilston, Coventry, Kidderminster, Leamington, Lichfield, Walsall, Warwick, Willenhall, West Bromwich, and Wolverhampton have their free libraries; but even London waits. In how many districts—in Marylebone, in Hackney, in Islington, in Bethnal Green, and others—would such a room supply what is lacking to many a working man—a quiet corner to read his paper, the want of which too often sends him to the public-house, the end of it being that his wife and children are neglected. We agree entirely with what Mr. J. D. Mullins has so well said on this head in his little tract on free libraries:—

“Adopt any of the systems of primary education which have been so much discussed of late, and a generation must pass before their effect can be realised. In the work of Free Libraries you may both sow and live to reap. The lower classes do manage to read to themselves and to one another to a far greater extent than is supposed. It is not uncommon to see one man reading very laboriously and very badly to another man who cannot read at all. Go into the lowest quarters of any great town, and see the number of shops that exist for the sale of cheap periodical literature. These are proof enough of the demand, of the hunger and thirst for information. But what about the supply? Here you have the “Mysteries of London” and, the like, tales of villainy and seduction, thrilling romances, always being continued in our next. Here you have the great weekly *Murdermonger*, four-and-twenty columns of crime and filth for one penny. Here you have the *Halfpenny Demagogue*, the largest paper in the world, and all on one side. And the people feed on these for want of knowing better. Turn a pure language upon them, give them a wholesome and pleasant literature, and the statistics of existing Free Libraries prove that they will both use and value it. Visit the homes of the labouring classes; the men come home soon after six at night, get a wash and their tea. They cannot be expected always to stay at home and nurse the child—where shall they spend their few spare hours pleasantly? If there are Free

Newsrooms they go to them; if not, probably to the public-house; and who can fairly blame them?"

Another form of philanthropic work is sure to be named to the visitor before he has proceeded far. This is Sir Josiah Mason's Orphanage. When started at first it was intended for only fifty boys, and for a time it was carried on in a building near to the station at Erdington. But now a splendid edifice has been reared a little further out, in a commanding situation, and the original orphanage has been turned into almshouses, where, for a very small sum per week, between twenty and thirty old women are supplied with all that they want. A portion of the house is set apart for the reception of girls who have been reared in the orphanage, and who may be out of place for a time, or requiring rest. In this arrangement, the founder's care for his protégées is well seen. The new orphanage is certainly one of the most complete and beautiful structures we have examined. It has been built and endowed at an outlay of £260,000, and certainly no detail has been overlooked. Everything is solid, neat, and finished—sober in colouring and without extraneous ornament. There are some three hundred girls in the institution and one hundred boys. They are admirably taught, the boys being encouraged in every way to study drawing and other useful advanced branches; while the girls, who will mostly become domestic servants, are drafted by turns to do the work of the house, in kitchen, laundry, &c. The chapel, the schoolrooms, the officers' rooms are all exceedingly simple and tasteful, and the dormitories, though large, are clean and well ventilated. Ventilation, indeed, seems to have been specially in the mind of the architect; and if visitors should be as fortunate as we were in meeting Sir Josiah Mason in the institution—(still nimble in limb and clear-headed in his eighty-second year)—and in walking round and talking with him freely on the orphanage and its work, they will learn that he was to a great extent his own architect in building this home, as he was in building up his own fortune, and will be pleased at the pleasure with which the aged philanthropist looks on the result of his original contrivances in the way of kitchen-ranges, dough-workers, and bakers' ovens wherein fires have never been burned. With the liking of age to fight its "battles o'er again," he tells us as he goes along, how he never had any schooling, how he tried many things—was a baker's boy, but was determined to be something else, and never has felt

richer than when he was able to purchase a donkey and cart; and how proud he was when he found himself, at thirty years of age, ready to start on something more ambitious still, with five-and-twenty pounds in his pocket. And ever and anon he pauses to tell how both early and late, though a firm believer in self-help, he was compelled back on the belief that self-help can fully prevail only through God's help. "When I have done everything that can be done, and see no way to the end of it, then I just say, 'God, I have brought out all my judgment, my brain can do no more in this thing, yet I believe that it is a right thing, so may it please thee to give me a push.' And I get the push; for as sure as I have asked for help, help comes—some fresh idea, some new plan, and the thing gets done." And this, Sir Josiah assures us, has been his habit in his business, as it is now in his philanthropic work—in which he finds a daily blessing and gladness. The words and the work, brought vividly before the mind at one moment, have impressed us so that we are not likely soon to forget them.

Very different in some respects is another work of christian charity, with which we made acquaintance during our short stay in Birmingham. We had already visited some similar works in London; but in none of them did we see more of the personal element. This is the emigration homes of Mr. J. T. Middlemore, one for boys and one for girls. Here, we meet with abounding signs of the descent of bad qualities, of neglect, of ill-usage, and exposure to alien influences in childhood. Some of the children who have reached their ninth or tenth year are stunted and look *shrimpish* indeed, others are lame, bad-sighted, sickly; yet it is astonishing how soon they gain spirits, and jump about the playground in hearty enjoyment, falling sometimes into games of judge and jury which too closely recall former experiences to be permitted by the officers to proceed.

Mr. Middlemore who has entirely devoted himself to this work and persevered in it notwithstanding great weakness of health, is certainly in his sphere. His tact in management, his consideration for the children and his winning patience with them, have enabled him to succeed where not a few would have failed. Struck by the numbers of children who either had bad parents or had no home and roamed about the streets, and slept frequently under railway arches, or, by means not always honest, managed to secure a corner in some low twopenny lodging

house, he succeeded in 1872, in establishing two homes, with the view of training the children and transporting them to Canada; a "Reception and Distributing Home" having been instituted in London, Ontario. In spite of the large number of such children which a certain set of conditions constantly produce in every great town, they are not always easily got at, and Mr. Middlemore and his assistants have experienced to the full all the difficulties which others with the same ends in view have encountered in other towns. The lowest districts are visited: John Street, Thomas Street, the Inkleys the Gulleys and such like; and, after no little trouble in many cases, the suitable subjects are searched out. Conveyed to the Home, the first thing is to teach them the common decencies of life,—to be cleanly, to eat in a proper manner, and to submit to wear clean, well-made clothes. In some cases this cannot be done at once or soon; but kindness and perseverance at last succeed. The boy or girl comes to feel at home, to recognise that all is meant in kindness, and begins to co-operate. As this is merely a preparation home, and the children are generally but a few months in it,—very seldom more than six or eight—no effort is made to introduce industrial training, but the time is occupied in teaching them to read and write. Bible training and singing form a part, the latter a most important and helpful part, of the course. To see Mr. Middlemore, with his "big family" round him—the little ones in smaller curves in front—is a sight to be remembered. He has already transported three groups to Canada, where he has managed to settle them, and, judging from portraits and letters, of which we saw many, most of them must be well settled. Not a few of the younger ones have been adopted, and certainly look anything but like what "might-have-been." There are at present nearly fifty inmates in the Boys' Home, and between sixty and seventy in the Girls'—the bulk of whom will be taken out to Canada, their much-longed-for land of promise, in a month or so from our time of writing. Nearly one hundred children pass through the Homes every year—a larger number than that discharged from all the Birmingham Reformatories and Industrial Schools put together, and with a success they have no claim to. Out of two hundred in Canada only four have relapsed.

We have often heard objections raised to these emigration schemes. Of course, on

details, there may be in some cases room for improvement; but as to the principle of the thing, few thinking men surely would object. What are the chances for such children at home—children of drunkards, thieves, and vile men and women? All their associations are against them, and Mr. Middlemore, amongst many other claims to notice, deserves praise in this respect, that he has tried the experiment of settling lads at home, and has had cause deeply to regret it. This is one case which he has given—a very conclusive one:—

"Some time ago a boy named J—, a thief, living in John Street, was received into the Home. To estrange him from his predatory habits was found a desperate task. The Home seemed to furnish him only with a new scene for his thievish practices. Accidentally he disclosed a genius for drawing: the opportunity was seized, and the whole bent of his life was changed. From drawing he advanced to painting, entered the School of Design, and passed with wonderful rapidity from class to class. It seemed a shame to deprive Birmingham of such genius, and Mr. Middlemore resolved to apprentice him to one of the best firms of draughtsmen in the town. His employers were no less astonished at his ability than his benefactors had been. His eye was so quick and accurate, that in copying manuscript he would instinctively imitate the handwriting. One of the firm made him his special *protégé*, Mr. Middlemore's father kept him well supplied with the best materials for his private practice, and, above all, he was associated in the office with youths and men of worth and respectability. Could any chances have been more favourable? Yet, on an evil day, he met an old companion. The early instinct, scotched, not killed, seized him afresh: he robbed a boy on two occasions of a shilling, and meanly induced his victim to screen him by falsely confessing his own carelessness. He rushed back to his old haunts, and became not only a thief and criminal himself, but a maker of thieves and criminals, and he is now in the workhouse, prostrate with a loathsome disease. Such is the end of, perhaps, the most promising lad whom the Home has had within its walls—an end which would, without doubt, have been quite different had he emigrated to Canada."

The children, if let loose in this country are certain, sooner or later, to drift back. All experience agrees in this. Emigration is the best preventative, and it is an unspeakable gain that it has been taken up by such men as Mr. Middlemore. We could well have wished we could have given more space to Birmingham; we have done what we could to present a bird's-eye view of the most notable movements which came under our own notice, and we do trust that neither in point of interest nor in practical result, may our time and space prove to have been wasted, the more that we believe in some things London itself may learn a lesson from Birmingham.

H. A. PAGE.

WHAT SHE CAME THROUGH.

BY THE AUTHOR OF "LADY BELL," ETC.

CHAPTER XIX.—RIDING FOR THE ROCKETS.

UT there was one man—and that was Joel Wray—in the crowd who was as ignorant as the shipwrecked men of the fatal nature of the impediments to any attempts

at deliverance, and who, within ear-shot of explanations freely vouchsafed to him, flatly refused to be convinced. He kept thrusting himself into the front rank, and calling for a boat; declaring any money would be given for a boat, and volunteering to get afloat himself, while he summoned a crew to join him, in the name of God and Christ and all manhood.

As he urged and entreated, standing there in his labouring-man's clothes among sailors and fishers and those whom Long Dick considered gentlefolks to the like of him, Joel Wray's pleasant brown face seemed ennobled by the workings of disinterested emotion, while his dark eyes were shining, and his whole figure was instinct with energy and daring.

The Cheam crowd, under the pressure of the circumstance to which they themselves rose, bore better than might have been expected Joel Wray's forward and uncalled-for interposition. It was not an unheard-of thing for men, especially young men, to lose their heads before such a spectacle as that which presented itself on the Beacon Rock. It truly did in a manner level all distinctions of rank and calling, and make strangers and natives equal, before the calamity they

regarded with common sorrow, and were alike powerless to prevent.

"Thee knowest nowt about it, lad." "Thee mayest trust us, the thing ain't to be done, not for love nor money." "Ay, ay, neither for God's love, nor for good money." "Go afloat with you! It's liker we'll lay violent hands on you for a young madman of a ploughman, or a cowman—as has had no traffic with the water beyond the horse-ponds—and hold you back by main force, from castin' your life away, and makin' some mother, maybe, lose her bread-winner, and yon furriners not a straw-breadth farrer removed from the watery grave as is appointed for them, and what is we that we can stay the appointment? We didn't make the Beacon Rock and the Gannet Bay, as is impassible for boats in a storm, no more than we made the winds and the waves."

These protests, seasoned by an oath or two, where the men were roughest, were the worst remonstrances that Joel encountered.

It was Long Dick that was specially scandalised by his fellow's unreasonable, "owdacious" conduct. "Stand still, man, and dunno behave like a Jack fool, or a woman," he said grimly; "'ould you 'a a score more widders and orphans—and them near at home—than need be? D'you think nobody has a heart in 's breast, or blood in 's body cept yoursen? D'you think the worsen on us 'ouldn't do as much for yon poor perishin wretches as you did for me in the Broad, if we seed the least chance, which there ain't? You may know summat about fresh water, but them's owd sea-men and fishers to right and left on you, and I 'a took a voyage in my time. When we bide still, and can't lift a finger like this, you may 'a the grace to allow that the time 'a come for you to set your teeth and be quiet, and look at what God A'mighty 'a ordained and man cannot hinder, athout makin' a din like a 'oman, or a chile, or a bull o' Bashan, as can do nowt but holler and squeal and fight with the air—not that Pleasance behaves as comes to thatten; see what a brave lady she is."

Pleasance was standing wedged in among the crowd, stock-still and pale, with her fingers tightly interlaced, but uttering neither moan nor murmur. Yet she took in everything, from the raging gulph which yawned beneath the frail ship, held there thrust through, and

grating on the rock, to the devouring concern and agony of Joel Wray.

"This be no pleasure sight for you, Pleasance, and you may get your dead on cowl stan'in' there," said Long Dick to her. "Will I take you back to Granny's, sin I can do nowt, and there be nowt to be done, but wait for the ship partin' midships, and her hands bein' washed in a minent out of sight, till their corpses come up on the beach, in a week or ten days' time, wind and weather permittin'."

"Oh no," said Pleasance, with a little gasp and shudder; "I could not go and seek shelter for myself, and leave fellow-creatures hanging there; I ain't cold to speak of, I must watch with the rest."

Joel had forgotten her, but she did not mind that; it seemed only natural and right that he should forget her at such a moment, though she could not lose sight of him with his glistening eyes, and quivering lips; his desperate longing to peril himself to the utmost, so that something—the most desperate thing—were tried for those in great jeopardy.

"Rockets!" cried Joel suddenly, with a loud voice, and the proposal did not fall to the ground, like that for the boat, but was taken up and canvassed quickly in various tones by many voices.

It was just possible that by means of rockets a rope might be thrown to the vessel. They had not been thought of sooner, because none was to be had at Cheam, or nearer than at Dene-Fleet, a coastguard station six miles off.

It was certainly worth while, in the horrible inaction that was forced upon the people, to go in search of the rockets; but the probability was that the ship would not last till the return of a messenger. The jagged rocks in Gannet Bay did their work as speedily as surely. The tide was coming in; some weather judges held that the storm had not even yet reached its worst, and it was not likely to abate before the turn of the tide. Ere then a ship of twice the tons burden of this Norwegian brig would, in its position, according to precedent, split asunder, and be dashed rib from rib, and spar from spar. If a single foothold could have been of much matter in such a sea, not one would be left for frozen and cramped feet and hands to stay themselves by, and cling to with the last tenacity of life in death.

"I'll get a horse from the nearest inn, and ride like mad," said Joel, preparing to start

off on the instant, and only Long Dick contradicted him this time.

"My lad, let me go; the nearest stabling is at the Ship A-hoy. Landlord be acquent with me, not with you; he'll trust me with his beast when he may stickle at givin' en to you, even on sich an errand."

The argument was incontrovertible, yet Joel hesitated; but he was put down and compelled to stay, chafing, where he was. Long Dick hurried away, followed by an escort of boys anxious to see him ride off post-haste, with the flints flying from his horse's feet.

The interval between his going and coming again, was trying to those who stood in the blast and watched and keenly measured every change on the labouring ship—from the snapping like a twig of her bowsprit, to the straining of her mainmast—and calculated with beating hearts how long she would hold out. It seemed to give the bystanders a faint idea of how the time passed with the little group of men—the people on the shore counted five men and a boy—who still kept together at the stern, and still raised from time to time that piercing cry, growing bitter with the foretaste of death, of "Boat, boat!" to those whom the sufferers might judge inhumanly indifferent to the fate of their fellows, or basely careful of their own welfare.

"Men, an' we could on'y tell en that they need not fault us, as does all we can—we does, when we stands here and waits for the rockets, ready to run out in the surf and fling en with all our might! They might trust and forgive we with their last breath," complained an old boatman, wiping the sweat from his brow.

Pleasance, in her large and tender heart, freely forgave Joel Wray for his complete neglect of her. Nay, she turned to comfort him, where he stood in his misery of suspense, with his hands clenched and his back turned for the moment upon the spectacle. She managed to push her way to him, and put her hand half timidly on his arm.

"Long Dick will soon be back, Joel," she said softly.

He looked round on her with a faint, absent smile, took her hand and drew it within his arm, but dropped it the next moment and sprang forward to hail Long Dick, who came clattering down the rough road by which carts were wont to drive from the country round to the Dene and the sands for loads of sea-weed.

But a second glance showed that Dick

"WHAT SHE CAME THROUGH."

Page 46.

came empty-handed. The coast-guardsman at Dene-Fleet in whose charge the rockets were kept had been absent, and his subordinate, a prey to official etiquette, had refused to give them to Dick, unless he were furnished with a letter from the harbour-master—who bustled forward, too late, at the mention of his name, or from some other person in authority at Cheam.

"And did you not ride to the next justice or clergyman, and compel the rockets to be given up?" demanded Joel Wray anxiously.

Long Dick dismounted, and looked hurt at the reproach. "J 'a not thought on it," he said; "ought I to 'a done it? Squire and passon might 'a not had the power, or not trusted to me, no more than coast-guardsman did. I thought it bessen to ride back tust thing."

Joel Wray was not listening to him; he was tightening the girths of the smoking horse. "He is good for the six miles back to Dene-Fleet," he said, "and I shall get a fresh horse there."

And before Dick Blennerhasset could guess what Joel Wray was about, he had snatched the whip from Dick's hand, leapt on the horse, and was taking it back by the way it had come, considerably faster than Dick had ridden it.

Dick ran some steps, calling, "Stop en, stop en; he'll break 's neck and Muster Bennet's beastes's knees. What 'll Muster Bennet say? and the drowned men not saved when all is done. Joel Wray ain't the man, sure-ly, what 'll get the rock-yets, as were refused to me."

Joel Wray was beyond recall. Some of the bystanders said he was a daredevil, and some that he was a chap of spirit and resource, who might succeed. A better-dressed man came out of the crowd, the tanner to whom the unfortunate ship *Christian*, of Bergen, was due, and said that he would make good any loss to the landlord of the "Ship A-hoy" by the overriding of his horse. And the harbour-master tore a leaf from his pocket-book, and wrote a line with a pencil on the crown of his hat, his grey hair fluttering wildly in the wind, as he performed the feat, to be dispatched by a third messenger, sent after Joel to confirm his appeal.

No doubt it was a boon to those who were reduced to be mere spectators, to do even so little; and Pleasance followed Joel's headlong course with a passionate hope and prayer, not for his safety—she never doubted

that—but that he might be permitted to prevail, and change destiny itself.

In the meantime the raging storm knew no slackening; the battered, bruised ship began to sway where before it had been held as by a vice, and to heel over more and more on its beam-ends, while its hull was perceptibly lower in the fierce strife of the water.

If Joel rode like the wind—no slower, he might be back in time.

Pleasance heard experienced mensay, under their breath, that the very minutes of the ship were numbered. She was aware that the lamentations and cries of horror which had greeted the ship's striking, but which had died out in the long watch, were beginning to rise again, hoarse and shrill, in anticipation of the crisis.

The minutes ceased to lag; they seemed rather to flash past like lightning, and but a few more were gone, when the mainmast of the brig was seen to part clean from the deck, and go over the side, raising such a whirl and spout of water, that for a second the gazers believed that the brig itself had broken up, and sunk bodily.

"Her's gone, it is all over," was the involuntary hushed cry, as when a human creature dies, and a portion of the crowd, consisting mostly of women, hardly knowing what they did, but unable to bear the desolation that they anticipated, broke off from the crowd, turned their backs and began to flee from the sight, which they had braved the morning's exposure to witness.

But not only did the vessel still remain, her crew, of whom only one man had been crushed and washed overboard by the fall of the mast, still clinging, huddled together to the sinking stem, were keenly alive, in their misery, to what passed on the partially-revealed shore, to which they looked in vain for salvation. They marked what seemed the dispersion of the crowd, and there arose again that cry of "Boat! boat!" in such a wail of despairing anguish, as those who heard it never forgot, and which caused many of the people present to cover their ears to shut out the sound.

It was the last effort of the foreign sailors; within another minute, when a bigger wave broke over the pitiable wreck, it disappeared as in the twinkling of an eye, without another cry to ring its knell, save from the strange men and women on the shore. All that was left of the ship had been carried back in the trough of the wave, leaving nothing but the water more fiercely

churned than before, and here and there a black speck of a floating yard, as the sole vestige of beams and rigging—the sole token where a ship had sailed the sea and carried on board of her human hearts with their freight of hopes and fears. Not a man was there clinging to plank or spar—the men's strength had been worn out by the long and fruitless struggle, their spirit had been broken by the denial of their prayer—in the incidents of the final moment, no so-called happy accident had flung one man of them within reach of a stay, however slight, the bitterness of death was past, and the last conflict was brief.

Pleasance was too sick at heart to indulge in that "good cry" taken by the other women who had stayed to see the end of the *Christian* of Bergen, or to moralise with them on those "Norway" women, whose men had perished before their English eyes, those women who would have so little knowledge at this moment, in the comfort and cheerfulness of their homes, of the terrible evil that had befallen them.

Still Pleasance resisted being taken back to Granny's, when almost everybody was going away, and was fain to stay with the few who lingered in the dreary scene, and share, if she could not solace, what would be Joel Wray's sore disappointment and regret, when he should arrive and find that even though he had been successful, all his exertions were too late.

When Joel did come, he looked at first as if he took the trial more quietly than might have been expected from his previous conduct. He had been aware of the extinction of the last chance, before he had got to the Dene he had seen from the road that the ship had vanished, and his pain might have been partly spent. Anyway, though he alighted in silence, and the tears came into his eyes as he laid down the box of rockets which he had brought with him, and although he quickly and decidedly refused the offer of reward which was pressed upon him both by the harbour-master and the tanner who had an interest in the lost brig, Joel arranged calmly enough to take the strange horse, which he had got somehow, to the stable of the "Ship A-hoy," and to assure the landlord of the safety of his horse at Dene-Fleet, and of the transfer of the respective beasts in the course of the afternoon. Then Joel agreed to follow Pleasance and Long Dick to Granny's, whence the party must take their way, in the course of the afternoon, back to the Manor farm.

CHAPTER XX.—THE GROUND SWELL IN THE SEA AND IN THE SOUL.

BUT when Joel Wray appeared at Granny's, it was clear that the composure which he had assumed at the Dene had been the result of self-restraint, and that he was upset and wretched because of the calamity which he had failed to avert.

He sat with his elbows on the table and his head in his hands, mutely declining the viands to which Granny, notwithstanding her preoccupation, had added a fresh store, and which she could not conceive that any man in his senses, now that the wreck was over, and no more was to be seen, could reject.

"Thee's earned thee's meal, lad," she even said, patronisingly, to one who, as she had been told, had contributed creditably, for a landsman, to the day's great doings. "Thee mun be nation hungry, after assistin' at sich a wreck as ain't to be seen often in them days, though they was plenty as blackberries when I were young; fall to thee's victuals, and cut a figure at them, as thee'st cut at thee's first wreck."

But Joel cut no figure either in eating or conversation, and joined in no proposal to make the best of all that was left of the holiday, which had been planned so auspiciously, but the greater part of which had been claimed perforce from the holiday makers, by the misery at their door.

The storm, as if it had stayed only to wreak its worst on the wrecked ship, and the drowned men, had begun to sink as suddenly as it had risen, growling in exhaustion.

It would soon be possible even for Lizzie to venture abroad, and see what was to be seen in the town and on the shore, but nobody had any heart left for the excursion. Lizzie had kept the house patiently enough, though in trembling solicitude, lest the chimney should fall—lest Long Dick, who was so strong and venturesome, should think of going afloat, though Granny said it could not be done. She was too thankful to have them all back, safe and sound, with Long Dick, towering in the midst of them, the safest and soundest of all; she was too content to listen open-mouthed to the dismal account of the wreck, and to Dick's somewhat heavy reflections upon the same, to wish for any fresh movement on her account. And those who should have been the life and soul of the holiday, Pleasance and Joel, were not themselves that afternoon to take double joy out of the fragments, as arrears of what had been lost to them.

Joel was pale, troubled, almost distraught, as it seemed, and Pleasance's heart was swelling with pity for him.

"They be past pain now," said Long Dick, with an enviable assurance that he was giving comfort to himself and all around by the unanswerable statement. "The thing be done and ended, and no more at present," went on Dick, vaguely, as if he were finishing a letter, "it beant no better than crying over spilt milk, as well as cryin' outagin Providence to get down in the mouth or go into the dumps and that;" and here he looked hard at Joel's strange disorder, "along on what can't be mended."

"The next thing," said Granny, briskly, "will be the corpses bein' washed ashore; if so be, they beant carried away eastward, norard, or sudard out of our wash. There beant no sharkses in our waters like as I 'a heard my owd man tell on sharkses in furrin seas; but the Gannet Bay rocks are wors'n sharkses. Howsomever, the corpses, what's left on them, 'll be laid out clean and purpose in the lock-up, or sich like, though you don't be here to see, till so be passon find time to bury em."

Joel writhed and looked up hastily, as if he were going to speak, but said nothing.

"Wool," said Long Dick, still taking the most agreeable view of things under the circumstances, "the poor chaps 'll sleep as sound in the graveyard here at Cheam as in their ownst; and as for murners, why they 'll 'a murners enough as is their own people, in time, when the news travels. They ain't friends of ourn, that we should murn for en," ended Dick with a strong sense of the mingled liberty taken and impropriety committed by such extraneous, uncalled for mourning.

Still Joel Wray, usually so quick, would not take the hint, and still Pleasance was weighed down with his sorrow.

"I'm thinkin we mun be steppin'," said Long Dick at last, tired of his unusual office of being spokesman to so unresponsive an assembly—unless Granny, who went far beyond him in her philosophy, and Lizzie, who was apt to count for nothing with Dick, if she did not disgust him by her unvarying admiration, except when he specially wanted sympathy or solace. "Pouney be fresh, no doubt, but the wind is scrowgin' yet and weather none to boast on; there be foun on us, and one, leastways, well grown, and we be six good miles from Manor farm; and Missus Balls—her can't abide lateness—do'ee hear, Pleasance?"

Yes, Pleasance heard; and though she was inclined to have infinite patience with this mood of Joel Wray's, this malady of vicarious suffering on his part, yet for Joel's own sake, she was driven to welcome along with Long Dick the necessary diversion.

When all the preparations were made, Joel started up from his absorption. "I ain't going back with you," he said, hurriedly, "I could not bear it—not to night, I mean. I shall stop a few days behind here, and then—" he caught Pleasance's wondering, distressed, beseeching look, and seemed to change the end of his sentence; "well, then, I may turn up again at Manor farm, if any one cares to have me there."

"The lad, he be in a creel," said Granny, putting her word in, and using an old fish-wife's phrase, "what 'ould take thee to stop here for? We han't wrecks every day, and thee be'st full owd to take to the sea for a livin' after seeing it the master to-day."

Even Granny, with her passion for the sea, was puzzled by its conquest on this occasion.

"Not take the cart home, lad!" said Long Dick in unfeigned bewilderment, while he was far too simple and honest himself to catch at the suggestion of getting rid of Joel and his favoured suit, by his own queer extravagant thinskinness, his liability to moping, or whatever it was that was tending to produce in him this waywardness and fickleness. "To stop here 'ould belong to expense, and how could you get back again?"

"Leave the expense to me," said Joel pettishly, in his pain; "and as for the road, it is a little bit to tramp it, as I tramped before; I have walked as far as that many a time before breakfast."

"But why d' you go for to stop?" argued Long Dick, impelled to protest still farther, since it was evident to everybody that Joel was in misery. "You are a day's-man, and may bide away for a day or a week, and be taken on again if bailiff please; but there were no word on stoppen behind when we started. It sounds contrairy in you to be arter stoppin at this time o' day; you can't be so mad as to think t' sea will give up what 'a been swallowed right down all alive and kickin', so as it will be of any use for you to stop and lend a hand? Come, Joel, you be mighty fond on lendin' a hand, I know that, and thank you for it, as my own debt, but there's nowt to be done here; you 'a done your best, bor, more'n was called for, when you rid Muster Bennet's horse twice over. Let a-be what ain't to be betterned, and come with us. Why we

'ould 'a no peace to ride home and go to beds and to works to-morrer a-leaving you dazed and strook, and takin' the wreck to heart like this."

"I have not done my best," said Joel Wray, standing at bay, passionately, "but you know nothing about it. I may have done wrong from the first; there seemed no good in retracting just then—and who would have believed me? Never mind me, Long Dick, or you, Pleasance. I can take care of myself. I shall do very well. Leave me alone, like good souls. I shall come to you again when I have got over this shock, or whatever you like to call it."

The last words were spoken more like Joel, though they were clearly wrung from him by the exigencies of the moment, as he stood there pale, with the chill of exposure to the storm not thrown off, depressed, tormented by the appropriation to himself of blame and punishment in the disaster which had happened, and which, to the others, was far removed from him and them, except in their common humanity with the sufferers. It constituted a mystery they could not by any means comprehend.

There was nothing for it save for them to go without him, dispirited in their turn, and perplexed by his desertion.

"Joel Wray's heart d' be in the right place," said Long Dick as they drove away, "but there be a want on ballast in the lad."

But Pleasance could not think too tenderly of the generous sensitiveness and self-accusation which had come between and separated her and Joel Wray for the time.

CHAPTER XXII.—THE DEAD BURIED AND THE LIVING COMFORTED.

JOEL WRAY'S dejection was talked of like everything else at Saxford.

Long Dick felt and confessed, not without rue—because Joel had saved his life, but with candid emphasis, that, when he came to think of it, he could be reconciled to his deliverer's staying away altogether, and never turning up again. Mrs. Balls said openly and loudly, out of Pleasance's hearing, for Pleasance must please herself, that it was an ill wind which blew nobody good, and that she for one would not complain of the storm which had disturbed the thatch on the newly-taken-in stacks, half unroofed the pigeon-house, and wrought greater devastation still on the coast of Cheam, if it had blown Joel Wray clean away from Manor farm.

But when Clem Blennerhasset went over to Cheam within the fortnight, he brought

back word that Joel Wray was coming home—he had used the expression himself—next day. Clem added the information that the bodies of the drowned Norwegian seamen had come ashore and had been buried, and that Joel had been at their funeral.

Long Dick said nothing farther. Joel Wray was free to come and go; Long Dick would have admitted that at the worst, and Joel was entitled to more than freedom—to a welcome from the man whose preserver he had been. Besides, Joel had established an amnesty between them, even in that nearest matter which went to Long Dick's very heart, and smote it with untold pangs. Mrs. Balls and Joe, natural opponents as they might be, were both right, Pleasance Hatton should please herself, a free field and no favour was all that an honest man could ask.

Long Dick had been accustomed to pride himself on his honesty. He knew, as well as another, that though big and strong as Saul among the people, and shrewd and wise enough in country matters, so as to be respected and prospering, he was also slow and dull in what he called "book know" and in manners—not only compared to Pleasance, but to this slip of a stuck mechanic and day's-man. Moreover Dick was keenly conscious, ever since he had been a humble worshipper of Pleasance Hatton's, that he was liable to disgrace and degrade himself by going "on the sprec," even though it were, in some measure, she who unwittingly and unwillingly drove him to it. But he thought he was honest; he was willing to stand or fall upon his honesty.

Neither was Dick altogether without hope to encourage him in his honesty, and in his moderation and forbearance. He had been first on the field; his friendship with Pleasance was an old-established fact; her evident, undisguised, while quite maidenly, liking for Joel Wray, with his novelty, his attractions which charmed most women, and his eager homage to herself, might be but a passing fancy, all the more superficial that it was so openly displayed.

Long Dick would not let go his lingering hope. He would not realise defeat with the great purpose of his life frustrated, and only an echoing blank, which might grow hideous, left behind, while a single thread of the strand remained.

Mrs. Balls, being a woman, saw farther. She received the news of Joel Wray's return with a rebellious groan, and with the angry comment that "it would take

long ort' devil he were found dead along on the wall."

Pleasance, however puzzled and disturbed, had never lost her perfect trust in Joel Wray. Kind, generous, manly Joel in his labourer's jacket, whose spirit was stirred within him by the woes of others, who had been outwardly gruff and impatient because he was inwardly so gentle, and who had stayed behind to pay the last honour in reverence and tenderness to the stranger dead.

Pleasance had always known absolutely in her own mind that he would reappear presently at the Manor farm, as he had reappeared in summer after his first advent in spring. What she felt on hearing that he was soon coming again was not a wild throb of reactionary joy, as intense as the tension of grief and fear which had preceded it, but a soft, all-pervading pleasure, with a longing that was almost painful in its exceeding sweetness, to go forth to meet him, and comfort and praise him.

It was Indian summer weather that had settled down on the east country, after the first tempest-blast of autumn. It promised an interregnum of sunshine and mellow warmth—all the more acceptable that it was crisped with a tinge of frost in the mornings and evenings—before the regular gales of the early winter should sweep the fields, which wanted wood to make them brown, and which were as yet only white after harvest with a cold blueness creeping into the grass green of the meadows, and meeting the greying russet of the hedges. But it was not November yet—it was no more than the first of October. The flood of golden light which bathed the bare fields, glowed copper-colour in the ditches, and flung an orange glory on the purple moorland, and against which the gaunt arms and white sails of the windmills, and the umber sails of the barges, stood out in bold relief, was met by an earth still unlighted, and with a bloom in its bareness, having fruit—wild haws, and blackberries, and domestic apples and pears, where flowers had been, and a few flowers still, silverweed and mallow by the road-side, and marigolds and convulvulus in the cottage gardens.

Pleasance had gone out in the unbroken, unshaded sunset splendour which was harmless and undazzling, to look through the stream of slanting beams at the cows coming loving home from the stubble, where they were finding the last and richest clover crop. She was standing thus, with the yellow gables and olive thatch of the Manor-house behind

her, by the side of the field-path which joined the road to the village—the very field-path where Joel Wray had first seen Pleasance, as she rode up sitting on the unsaddled back of the cart-horse Punch, with Long Dick walking by her side, and Miles and Phillis Plum following behind—when she encountered Joel on his way back from Cheam.

He looked grave, and a little worn still, as if he had come through some trouble, and been having a trying time of it; but he smiled to see her, and stopped at once, calling her attention to the beauty of the evening, and saying that he could not have enough of it, and was loth to go in, for he was not wearied by his walk, and he was not wanting his supper yet. He should prefer to loiter about and see the last of this unclouded sunset, one of the most simply gorgeous in its peace that he had ever beheld. Would she stroll with him to the first ridge of the moorland? It was not above ten minutes' walk from where they stood, and the prospect there, though more confined, would be even finer in its way, and then he could tell her all that he had been doing in the recovery of the bodies of the poor lost foreign fellows, and the laying them in the earth.

Pleasance complied at once, colouring a little with that rich radiant colour of hers which made her, while it lasted, so beautiful a woman.

Joel Wray did not say much as they went—beyond a passing question about how things had been going on at the farm in his absence, and an observation on the partridges they startled in the turnip-field and on the rooks which were going home to roost.

He was languid, if no longer oppressed, and sought quiet and a soothing influence, which he had an instinct that he would find on the moorland ridge in such companionship.

"Ah! now I can speak to you about it all," he said, half wearily, half in pleased anticipation of an outlet to his pent-up feelings, as he threw himself down on a flat stone and clasped his hands above his head. "Will you sit down beside me, Pleasance, and listen; but first tell me, ain't you fond of this spot?"

There was at this time a curious blending of boyishness and manliness in Joel, and in that lay a part of his charm, especially to such a woman as Pleasance Hatton, in whose nature undeveloped motherliness was a strong element, and whose

love would always crave to give as well as to take protection along with every other benefit. Sometimes this boyishness of Joel Wray's had a strain in it of imperiousness and refractoriness, belonging to the spoiledness of which he had once spoken to Long Dick. But at the present moment it was the wholly winning boyishness of a manly nature, essentially youthful in its manliness, and which was recovering from a blow or check, and looking round ready and willing to take, without any churlishness, whatever good things should be granted to it in compensation.

Pleasance could tell him that she was very fond of the spot where they were resting.

It was, as he had said, not more than ten minutes' walk from Manor farm, in the opposite direction from the village; but it had such an atmosphere of solitude—with exceptions which only tended to make the solitude in other respects more felt—that it might have been a nook among the everlasting hills hundreds of miles away from the flat, tame, bullock-feeding, and milk-producing east country.

The high level of the land rose here from pasture to moorland, and being broken into a dip between a greater and less heather and furze-crowned summit, it shut the spectator into a purple and golden hollow, from which nothing could be seen of cultivation or civilisation save the swinging arms of one of the unfailing windmills, and the gliding sails of an equally unfailing barge on one of the slow rivers which flowed through the moor as through the pasture-land.

Pleasance had been wont to come here at rare leisure times, to find herself alone, except for the windmill, and it might be a barge, with the heather, the furze, and the sky; to fancy herself away in a northern wilderness; to look for plovers' and moorhens' nests; to listen to the crow of the moorcock; to gather little tufts of blue and pink liverwort, yellow rock-rose, and white grass of Patnassus, in addition to heather-bells when they were in season.

But whether the shoulder of the moor lay in the clear light of the morning, or dappled by the great cloud-shadows of noon, or in the tempered serenity of the afternoon sun, or as now under the burning gold, passing into rose and crimson and purple, and wavering and waning away again in its glory, into pink and lilac, amber and buff, and the intermediate dim sea-green that terminated in the deepest blue, and in which the first star or the new moon hung them-

selves, she was satisfied that her bit of moor was nearest perfection at sunset.

Joel began to speak at last—with an effort even yet, and in an undertone, while he leant on one elbow and plucked the heather with the other hand—of the men for whose loss he, a passing stranger, had grieved as it seemed beyond bounds.

"Yes, they are laid at rest; we have been able to do that for them," he said, with a face that contracted and a voice that grew stern, and sunk into a smothered groan, as if recollection had brought back upon him the mental burden which had been hardly lifted off.

"But why should you, of all men, reproach yourself, Joel?" Pleasance could not refrain from asking in remonstrance; "you who strove to the utmost to avert the poor sailors' fate."

"You do not understand—none of you understand," he kept saying, half impatiently, half wearily. "I am not so clear about there having been no possibility of putting out a boat; but it may have been as they said; Gannet Bay may be such ground that no boat could have lived there, and to send out one would only have been to destruction; and the boatmen might have known that so thoroughly, that, rightly enough, neither money nor influence, nor anything else, could have urged them to the rash deed. But look here, Pleasance: if I had ridden first to Dene-Fleet, I should have got the rockets at once; the lost time would have been saved; the rockets would have come in time; a line might have reached the vessel, and these five men and the boy who are now (all that are left of them) stark and still in Cheam grave-yard might have been as hale and hearty as we are this night, returning to comfort their wives and mothers, to get fresh ships, and go on new ventures until they were grown old and grey, and—escaping the sea at last—might have died in their beds with their children and grandchildren about them."

"But it seemed most expedient that Long Dick should go," argued Pleasance, divided between feeling half hurt for Long Dick—who, she was certain, had done his best—and experiencing the most genuine compassion for the pain told by the voice at her elbow. "You might have failed, to begin with, as he did, and then—" And she hesitated, and spoke again as if impelled to speak, in low tones of earnestness and awe. "It is God's will, though it is a mystery to us why He should not have saved them. The men

were in his hands all the while. Their time had come. He suffered them to die thus. It is very sad ; but if it be his will, it cannot be altogether wrong and miserable, can it ?”

“I should not have failed,” Joel insisted, perversely going back to the first count in her speech ; “there might have been delay, but it would not have been for long. I happened to know better than the rest of you.

You women always lay hold on devout consolations. Well, I am far from objecting to them, when one can take refuge in them. I believe in God and his providence, and in the Lord who once walked on the sea ; but to be fit to take that comfort a fellow must have done his best. I have not done mine, as all you innocent people credit me with doing. I have held myself bound by an

Page 368.

obligation which, whether foolish or not, was of my own imposing, when I should have broken loose from it. It is useless to speak of it now,” he ended, with a deep sigh ; “I shall never cease to reflect upon myself for not doing all I could to hinder these poor fellows’ melancholy end. And think what it was for me to see them,” he ended with a shudder, “when the sea gave them up at

last, all mangled, with the very stamp of humanity beaten out of them by the rocks. But I shan’t inflict the miserable description on you ; I shall only tell you about the little lad. He could not have been more than twelve years old. His body had been carried far out beyond the bay, and was floated in upon the soft sands, and there was not a bruise or cut upon him. Except for the

blue whiteness of his lips, his dragged hair, and his eyes staring sightless at the sky, he might have been sleeping. And, Pleasance, his pockets were stuffed with toys—such little jumping-jacks and dolls as a boy of twelve would hold in utter contempt. I suppose he had bought them the last time he was on shore to carry home to his little brothers and sisters. I remember buying the like when I was a boy, at fairs, for my sister Jane."

He stopped abruptly with a break in his voice, for which, even in the middle of his desperate compunction, he was ashamed and angry with himself.

Pleasance looked away from him, not to appear to see how moved he was, and because she was crying herself very quietly; but as she turned aside her head, she put her warm hand into his. He held her hand fast, and then, as he continued to clasp it, a flush came into his brown face, and a new light into his eyes.

"I know that I am not worth very much," he said, with his voice more unsteady than before, but with a world of different meaning, of entirely changed ideas and partially repressed eagerness and longing in its faltering, "I know that better than ever, at this moment; but if you were content to stand by me always, Pleasance, I think you might make something of me; and come what like, I shall seek you for my wife, because I love you dearly."

She did not answer him at first; there seemed no need of answer when she sat with her hand in his, which drew her nearer to him still. Her face was hidden on his shoulder. And then it flashed upon her that he had come to Manor farm the poorest wanderer, that he was not considered by those who granted her the working woman's independence in pleasing herself, a fit match for her, and that she was better born than her fellows, and had her little patrimony. So she took heart, and lifted up her face, and said fairly,—

"And I love you, Joel; I think I have loved you from the moment that we first saw each other—ever since you loved me."

He kissed her fondly after that word, and they walked back to the Manor farm together, plighted man and wife, before the day which had brought them so much, was quite done, while its radiance was still bright in the west.

CHAPTER XXII.—THE TALK IN THE GARDEN.

Not even Mrs. Balls knew that night of the engagement which had taken place.

Pleasance wished to keep it to herself till she could realise it as a fact—the greatest, most blessed fact of her life—accomplished so suddenly, almost inadvertently, but never to be set aside, or undone, or forgotten, while she lived and retained thought and feeling and memory of happiness.

She wished, too, to enter on some arrangement with Joel Wray, that should make the news which they had to give sound less improbable and daring, perhaps even less foolish and imprudent. The couple must occasion disappointment and give pain; there was no help for it, Pleasance told herself, with pitiful regret intruding upon and subduing the exultation of her natural pride and joy; but not she herself would feel such tender concern for the dreams that they would disperse, the hopes they would extinguish, and the wounds they would inflict, as would Joel Wray. Pleasance even wept to think of the generosity and gentle kindness of the brave lad who had set his love upon her, and told herself that in place of his not being worthy of her—as in his modesty and propensity to self-depreciation he had asserted—she was not worthy of him.

Pleasance had not much care for the utter unworldliness of the marriage she was about to make. She had identified herself with that class, who being so low that they need fear no fall, can afford to be unworldly; and she believed that they two could command between them such qualities and faculties, in addition to a little fund of ready money to begin upon, as should enable them to start in life without debt, and to go on with a fair prospect of a reasonable amount of prosperity in their station.

Joel Wray had shown himself, as far as he was known, perfectly sober and well-principled. He had placed himself in the debatable position of a young man who had chosen to abandon his original calling, and was a working man on the tramp, doing odd jobs, and hiring himself here and there; nevertheless, he was active, industrious, and wonderfully capable in work that was strange to him. The instability or eccentricity which had caused a young working man—who had been so worthily ambitious that he must have spent every spare hour on self-improvement, in order to get the culture which he had won—to frustrate his own aims and spoil his future, by giving way to fancifulness, had stopped short of doing him farther injury.

And this eccentricity, as Pleasance preferred to call it, had a certain sweet fasci-

nation for her, belonging, as it seemed to do, to the unworldly chivalrous side of his nature. Joel Wray worked to help; he did not care so much for the particular nature of the work, or for the wages. Like the god Apollo, he would be an assistant all over the world.

There might be a little conceit, as Pleasance was fain to admit (indeed, the curious compound in Joel Wray of boyish conceit and manly humility was very manifest), in this desultoriness; but it was a gracious conceit, and how could Pleasance be angry or even vexed with the eccentricity which had brought Joel from being a thriving mechanic in a town, to be a day-labourer, hoeing wheat and cutting corn, and electrifying her with his knowledge and grace and learning, to love her at Manor farm?

The bulk of Pleasance's little inheritance, of which the deposit receipt had reached her in due time, and which at her own request had been transferred to one of the Cheam banks, was there to defray the extra expenses of setting up in life and enable the couple to begin housekeeping, while retaining a modest reserve for a rainy day.

Pleasance had from the first got good out of her money; but in her power and inclination to maintain herself by her own industry, she had never till now known what a great personal boon it might be to have a little money at her disposal, to smooth difficulties, to make matters easy, and to render safe steps which might have been dangerous. She began for the first time to be grateful on her own account to her father for having spared this money for his children, and to reflect wistfully on the scraps of information which had reached her of his having laboured in his voluntary expatriation, though without success, to increase their store. Poor father! he had known something of life; he had been aware that what was enough for Pleasance in her present low estate, would have by no means served both her and Anne in a higher station.

It was such delight to Pleasance to think that she could give this help to Joel Wray in bringing about their marriage, and she was sure that Joel in his simplicity, and in the sincerity of his love, would not be too proud to take from her what she could give, in the spirit in which she would give it; but, on the contrary, that he would rejoice with her in receiving what, in other circumstances, he would as gladly have bestowed.

Pleasance had the undoubting happiness of a child in that unbounded trust in Joel Wray's disinterestedness, which was only partly justified by appearances; because a man may be lavish of his gifts, and even recklessly generous, after a fashion, and for that very reason may possess himself of his neighbour's gifts as if they were his by right, and may squander them still more freely than he has spent his own.

Pleasance could not tell and did not ask what hostage Joel would give for his working steadily, and earning sufficient wages to keep both himself and her in the future.

She was ready to do as he wished, but for her own part she would prefer that they should sacrifice a good deal by remaining in the country. She shrank a little, though she would meet anything for Joel's sake—share anything with Joel, from encountering the portion of working people in a great city—the mean quarters, the limited crowded accommodation, the close, foul air—above all, the strange, it might be evil, associations; though Pleasance knew better than to think for a moment that the low, any more than the high, must be the vicious. But like most healthy, simple constitutions, and most sensitive, imaginative natures, she clung to the country with its space and freedom, its pure air, and sweet sights and sounds, which were open to all.

Then Pleasance must have Mrs. Balls with her, to care for and cheer her kind old cousin's last years. Joel, who had so much consideration and tenderness for others, would not say nay to that; and he would soon cause Mrs. Balls to forget poor Long Dick, even so far as making a pet and idol of him, Joel Wray, was concerned; for Joel had nice son's ways to old women, as Pleasance had seen and admired in his behaviour to Phillis Plum.

For Mrs. Balls's content it would be well if the united family could continue where Pleasance had made her second beginning in life, and had grown up in it till she was fain to think of Manor farm and Saxford—their familiar rusticities and rudenesses, their friendliness and enmity, their comforts and troubles, with the fond forbearance, kindly regard, and faithful pride that a true heart feels for its native place. Joel seemed to have taken to the neighbourhood, and might get work, whether as carpenter or farm-labourer, there as elsewhere, and she would certainly be more secure of work in her turn where she was known and respected, as Pleasance felt with honest satisfaction.

But Joel should settle all those particulars.

Joel was not slow to claim his title to enter into the preliminary arrangements. He came the next day at the mid-day unyoking—for the autumn ploughing was begun, and he was doing his best to work a pair of horses—straight to the Manor-house and asked, with a smile on his lips and a little colour in his brown cheek, but without any faltering or equivocating, to speak with Pleasance.

It was the first moment that he was at liberty, but it was an inconvenient moment. It cost him his dinner, to Phillis Plum's chagrin, and it interrupted Pleasance at her own meal, to Mrs. Balls's indignation. Notwithstanding Pleasance might please herself about her dinner as about her lover, since the lower men and women descend in the social scale the more they are privileged to dwell in a Liberty Hall, until the savage's licence of eating when he is hungry and drinking when he is thirsty is within sight.

Joel Wray cared little for his empty stomach provided he could get Pleasance to himself for an hour among the brown-podded sweet peas and green-seeded candy-tuft, and the russet bushy walnut-trees, which remained as a relic of the long-fled dignity of the Manor. The autumn sun was shining as yet, though a shower was threatening to fall. But what cared the couple, at the height of their bliss, for anything so merely mundane in its damping as rain-drops? It was not possible to damp the two in their perfect confidence, entire agreement, and true love.

"I have come to see what I am to do, Pleasance," he said gaily; "you know something must be done immediately."

"But we cannot marry right out of hand, Joel," said Pleasance, with a little coy laugh, while pleased in her heart that her lover should desire to strike when the iron was hot—should propose to conduct one of those short, sharp wooings which the old adage pronounces pre-eminently happy. "I have not even spoken to Mrs. Balls."

"Then speak to her, darling, or let me speak to her, at once. I am not going to be put off a moment longer than I can help. I have more reason than most men to press for a speedy marriage." He gave a little conscious laugh in his turn, but there was an excited restlessness in the laugh and in his joy that was not in Pleasance's happiness. She judged it might be the difference between man and woman which in his ardour thus panted for the attainment of an end.

Pleasance's knowledge of life, whether

derived from personal experience or books, had not been of the increasingly artificial, egotistical kind of the present day. She had not seen and read much of the exceeding wariness, well-nigh reluctance, with which a large proportion of intending bridegrooms are understood to approach the altar while deceitfully soliciting the company of their chosen brides as to a triumph, not to a sacrifice, a feast, not to a fast. Had it been otherwise she would have been still more struck with and flattered by Joel's eagerness for the fulfilment of their promise. Joel Wray—whether because of his humble origin, which, although it had not deprived him of intelligence or prevented him from acquiring knowledge, might have delivered him from the burden of over-estimation of his own merits and chances—whether from an innate peculiarity in the young fellow, was wild to marry Pleasance Hatton with as little probation as possible.

"We have nothing to keep us waiting," Joel urged, "after consulting our own happiness. To stay to consult others would only be a needless waste of time and peace, for you know that friends never agree upon the marriage of fellows or girls in whom they are interested. It is the one point on which the most devoted of friends cannot be trusted; in fact, it does seem that the more they are devoted, the less they can be trusted. I suppose that is the reason why the Bible bids a man leave father and mother, and cleave to his wife. When will you be my wife, Pleasance, my very own wife, for life and death? Will you be ready in a week? No? Surely you are not going to take a month, when you are perfection where you stand, and don't require the splendours of a fine lady's trousseau to make you fairer, or dearer, or happier?"

"You must allow time for the banns to be put up," said Pleasance jestingly.

"Oh, yes, the banns to be sure, but that is all we want, isn't it, Pleasance? It is good to want so little; to be all in all to each other, when we are to walk through the rest of life, up hill and down dale, side by side. Do you know, Pleasance, it seems to me the very poetry of marriage to take each other thus simply, while it is for better for worse, till death do us part, and beyond death, if God will!"

"I heard once of a marriage that would suit your fancy," Pleasance told him. "It happened away in the hop country, where strangers come for the hop harvest. The banns were published on successive Sundays

for two of these strangers whom nobody knew, and when the time came for the marriage, the couple (they were an elderly pair, worn with toil and care), with a friend to give away the bride, simply left the field where they had been working, and went into the church in their working-clothes, coarse and soiled, and so were married."

"That was grand in its way," said Joel enthusiastically.

"Yes," assented Pleasance, with a flush of pleasure at his sympathy with her own sentiment. "I think that must have been a very real marriage. I mean that it was stripped of all mere glitter, even in pretty fancies, and that the couple took each other at their poorest and plainest. But if they loved each other, what did it matter? They had all that was worth caring for in marriage when they had each other and their love. Gold is gold still, and cannot be rendered dross, though it may have been subjected to hard usage, and left dull and dented."

"I am altogether with you, Pleasance," said Joel, with a fond appreciation of what was heroic in her standard of truth. "But now tell me your views for me in our marriage."

"But you are not to be at my bidding," objected Pleasance; "I am to be at yours."

"Yes, yes; I am to be lord and master, don't fear. I am not going to resign my rule," said Joel, looking, as he often did, decidedly younger than Pleasance, though the greater youthfulness was not in years, and lay rather in lack of experience than in weakness of character. "Only when I can do it with a good conscience, I am to lay my rule at your feet, and at all times you are to reign as my queen consort. Do you hear that, Pleasance?"

"I hear and believe it," said Pleasance; "but it would sound funny to most people to hear you and me, a working man and woman, speaking of being kings and queens. I am afraid it is a little high-flown."

"No, it ain't," protested Joel seriously. "Veritable kings and queens have to go back in their ancestors to the times

'When Adam delved and Eve span.'

"And there was the first gentleman in the first working-man," chimed in Pleasance brightly.

"No doubt, dear; and you are a lady in a working woman, a true lady because you are not in the least ashamed of being a working woman."

"No, I am not ashamed," said Pleasance quietly; "I chose it so far. I must tell you all about that some day. I like working people best."

"Do you mean that you would not have cared for me, if I had been a gentleman?" asked Joel curiously, picking up a fallen walnut and beginning to peel off its split green husk assiduously, with his eyes fixed on the operation.

"I hardly think I should," she answered candidly. "If you had been—not one of the gentlemen and ladies that we have just been speaking of—not Adam's sort; but a gentleman in outward circumstances, idle, luxurious, effeminate."

"But gentlemen in outward circumstances need not be idle, luxurious, or effeminate," said Joel Wray in gentle remonstrance.

"I know they need not. I know many of them work harder with their heads than we work with our hands; but they are the exception in their class, and we are the rule in ours; and I like to see and think of you, Joel, as hard at work. I think that working men look then as if they were conquering the material world. I don't wonder at some ladies forgetting themselves, as it is called, and leaving their station to marry working men. No, I don't like ladies and gentlemen," ended Pleasance, shaking her head. "That is, I don't care for them so as to wish to belong to them."

"Then you would not like to be a lady—a lady out and out?" he continued to press the question.

"Oh, no," she said emphatically, "I should wear my heart out as a lady—not only have I no desire for it, but I would not be it for any consideration. I know I should make a very sorry lady. I was in process of being made one when I was a girl at a ladies' school, and in spite of my dear Miss Cayley, who was a very good schoolmistress, in spite of my own sister Anne, who was a thorough little lady, not only inwardly but outwardly, my friends were kept in constant anxiety about me because I showed every symptom of proving a very odd specimen of ladyhood."

When Pleasance stopped speaking, Joel Wray remained silent, and she had an impression that she had vexed him somehow. Was it by the supposition that in other circumstances she would not have come to care for him?

Pleasance was no coquette where coquetry is ungenerous, and she hastened to remove the impression.

"It is idle guessing what I should have done if you had been a gentleman, for we should never have met in that case; but it would have been my great misfortune then, for you would still have been Joel."

"And what is Joel?" he asked quickly.

"Why, you know very well Joel is Joel," said Pleasance a little impatiently, and twisting her fingers together with a bashfulness tending to awkwardness, which was unusual in her. "Of course, no other person could be Joel—there could not be another man like Joel to me in the world. I never saw any one like him, and though I have not lived very long till I have had the good fortune to find him—I know I could not find another like him—mind, to me, for I don't wish to make him vain, though I lived to the age of a hundred."

"That is my Pleasance, my jewel among women, whatever the setting," cried Joel ecstatically, putting his arm round her and showing himself altogether mollified. "But we are coming to no resolution how we are to proceed, and we must not lose time."

Then she told him with shy pride, and at the same time with instinctive care that he should not feel the obligation, of her few hundred pounds which she had inherited from her father, who had married beneath him.

He listened with great interest to the origin of her fortune, and questioned her with animation as to what she knew of her father's antecedents, saying that she would grace any name—and Hatton was a good name; but he would not have been surprised to find her well born on both sides of the house.

She saw that he was pleased to hear of her gentle descent, and was not sure that it was not a little weakness in him to be so pleased; but it was an innocent weakness, and if it gave him pleasure, what then? She was not going to marry an impossible monster of perfection, besides the fact that she was far from perfection herself. It was more than enough for her that Joel was true and brave, and oh! how tender of the woes of his fellows, and clever and bright! He might be crotchety as well as versatile, and innocently vain into the bargain—these were very pardonable spots on the sun. Moreover, she had read, though she had never felt it in her own experience—indeed, she had been driven to the opposite extremity by the catastrophe which had early befallen her—that to some, and those among the most poetic, if not the most powerful minds,

rank and station, with their dignity and harmony, offer a strong attraction. She had never suspected Joel Wray of a hankering after gentility; but it might be there for aught she knew—only of this she was certain, that it was a very harmless hankering, not at all affecting his simplicity and integrity—witness the philosophy with which he accommodated himself to the hardships of his day's-man life, his opinion coinciding with her own on what constituted a true marriage, and his positive indifference to the close of her tale.

For Joel had not only listened with perfect composure to her intended employment of her riches—of the existence of which he might have known previously—for their joint benefit, his coolness had approached to carelessness.

Pleasance was even slightly taken aback by this sublimity of indifference on Joel's part. He seemed to care as little for her having the money which she was so glad to give him, as she cared for the rain-drops which had begun to patter through the leaves of the dusky green walnut-tree.

It was not that he looked put out again, but simply that after delaying her narrative for the small matter of her father's having happened to be one of the gentlefolks about whom they had differed, he had hurried her on over the more important portion of her story.

Large-hearted as Pleasance was, she was a shade mortified in her turn. It was not that she exaggerated her slender amount of property, or made much of herself on account of it, but she had already conned and reconned the advantage that it was to be to her and Joel at the present epoch of their lives, with the delight of her having it in her power to confer this advantage and the glory to her of transferring the power. And that he should receive the communication with worse than the stolidity of Long Dick—with an apparent thoughtlessness that savoured of frivolity, was trying to Pleasance.

She had prided herself on Joel's disinterestedness, but this seemed disinterestedness appertaining to folly.

At last he gave her some explanation of his manner.

"Did you mean that your hundreds were all to go towards setting us up?" he said, rousing himself. "That was a great deal too good of you, dear. You must let me contribute my share. Did you not know that I had sayings? To be sure, I have savings."

Certainly it was to Joel's credit that, day's-man as he was living, he had held savings in the background. When Pleasance had time to reflect upon the matter, she would be rationally pleased with and grateful for the unlooked-for, off-hand announcement. It was like him, too, to have been silent on so important a particular, and to refer to it at last incidentally in this easy fashion.

But at the moment, the allusion which ought to have been welcome, came upon Pleasance with the effect of a disturbing element, overturning her programme, and well-nigh disconcerting her who was nearly as unworldly as her lover.

However, Joel Wray was not only captivated with Pleasance Hatton, he was enamoured of her with the whole force of a nature that was both passionate and stubborn in its crude impulsiveness and rashness, only he had not a woman's eyes, and he did not perceive as she might have perceived, that his divided attention and inclination to pass on with their conversation disappointed her.

"Pleasance," he said suddenly, throwing off the abstraction which had stolen over him, "have you thought that while you are willing to trust me with your means, and what, had they been ten thousand times larger, would still have been ten thousand times better worth—youself, you have never asked a single word about me farther than I have chosen to tell you? Have you not considered that there may be points—about my people, for instance, and my rearing—which you will not like?"

"It is you yourself, Joel, that I am going to marry," said Pleasance firmly and tenderly, "and I know you to be what I can trust. Of course I should care to hear all about you. I think that I should never weary of hearing what you did when you were a boy, during your short schooling and your first apprenticeship, and how manful you were as an apprentice. Oh! I know all about it," she continued, fondly and proudly, "about the first money you saved to buy a book—second-hand and at a book-stall, I daresay, I have read of such good beginnings—before you were old enough to join a mechanic's institute. I hardly require you to tell me, I see all the outlines for myself," she finished with shining eyes; "I only want you to fill them in."

"But if it should all have been different from what you suppose?" he said wistfully.

"It could not have been very different," she said confidently, "unless you had more

difficulties to struggle with than I have imagined; and then I should but love you more dearly for your courage and perseverance. As for your mother and sister, Joel—I think you have only a mother and sister, at least you have never referred to any other relation—I shall be too pleased to hear all about them. I hope they will like me, as I shall love them well for your sake, if they will let me. But, don't you see, it must be for your sake to begin with, and therefore I can wait till such time as you choose to make us friends even by hearsay. I have always thought that it was one of the good things of working people that, however united in other respects, each man and woman stood in a sense apart, and in all the great events of their lives could act singly and independently. You said a little while ago that it made marriage simple and true. It is as if working for himself and herself made a man and a woman of a lad and a girl, and fitted them to choose their own roads in life, and their own companions on those roads, with none to call in question their right of judgment."

"That is all right, but I must admit this to you," he confessed with some agitation, "that I am not on terms with my mother and sister at present. They took offence at the first hint of my coming into the country as I have done. We had a dispute, and parted on the dispute. I started without a word."

"But you could work as you pleased," said Pleasance, swift to resent for him the undue interference of his mother and sister.

"Oh! yes, I was of age, and my own master, and all that sort of thing," answered he quickly.

"Joel," cried Pleasance, "how differently you London workpeople speak from us country folks! We never hear of coming of age here unless for lords' or squires' sons, at least."

"In town we ape our betters," said Joel promptly. "But about my people, they will come round in time. Indeed, I could make my sister Jane come round any day. She is a dear little thing, and was always fond of me; only she swears by my mother, which is but right and natural in an only daughter. As for the old lady—oh! dear, no, she is not very old,"—he corrected himself, and laughing with recovered cheerfulness in response to the expression of Pleasance's face; "she is not more than six-and-forty, I am glad to say, but she is old to us, you know, and she has her prejudices, as

we have ours, I daresay, though you are the wisest, as well as the best and dearest woman in the world. But these prejudices must and will give way, and all will come right in the end. I thought I had better mention the difference with my family, to explain why I could not make you acquainted with them, or have them here for our wedding," he said frankly, with the relieved air of a person who had discharged an unpleasant obligation, and was happy in proportion.

"I did not suppose they could be here," said Pleasance, opening her eyes, "because of the expense. Some day, when we are all relations and friends, we may go and see them; it would be better for us to bear the inconvenience and cost. It is well to speak of railways having made travelling easy, but travelling is never easy for working people." And then she wondered within herself whether it was mean of her to feel pleased that she should have her young husband all to herself at first. "I am speaking," continued Pleasance, with an effort after lightness and with a heightened colour which showed how much she had the wish at heart, "as if it were fixed that we should live in the country, and hereabouts."

"Look here, should you like that very much to begin with, Pleasance?" he asked.

"Oh yes, I should," she owned.

"Then you shall have your wish," he said, in a low, loving tone; "and perhaps it will help to reconcile you to changes that may have to come afterwards."

"I shall not want to be reconciled to anything when I am with you, Joel," she said softly, fearing that she had been too eager in her wish, and grieved if he should think for a moment that she could be captious and exacting to him, who was consulting her in everything, who was so mindful of what was due to her, and so caressingly kind.

"So you think just now; but we shall see," he answered smilingly. "Not that I think you will want anything that I can give you, or that you will be unreasonable in asking me to do for you what I cannot do. You will be pleased to hear that Martin—the carpenter, you know, in the village—has offered me a job or two when I have looked in upon him, and I can fall back on that if Long Dick will not have me working here. Poor Long Dick! have you thought of him?"

"He will get over it," said Pleasance, with determined hopefulness; "he is not suffering so great a loss; he will do better for himself. If I was made for you, I could not

have been made for him. There is his cousin, Lizzie Blennerhasset; if he would only think of her in that way. She loves him—it is no secret—as—"

"As you love me," suggested Joel, laughing softly.

"No," denied Pleasance honestly. "It is little to say that I am willing to give you myself and all I have; and it is needless to vow, as lovers vow in books, that I would die for you, since I am not likely to be called upon to prove my words, though I think I might; and surely I am going to do more when I mean to live for you. Yet in spite of all, I am certain it is not in me to sink my identity in another's, and be content to be his servant and slave, to follow him like a dog, as Lizzie Blennerhasset follows Long Dick."

"I am quite satisfied with what you are and what you give," he swore roundly.

"And about Mrs. Balls, Joel?" she was emboldened to say, with a sweet beseeching tone in her boldness. "It is better that we should understand each other thoroughly; it would not be fair otherwise, and I cannot abide unfairness. She has been such a faithful cousin to me and mine; she was kind to my mother; she took Anne and me in when we were homeless. Anne died at the Manor house, and I have lived here ever since, a burden on Mrs. Balls's kindness for many a day. I could not bear to leave her now that I am independent, and can be of use to her, when she is getting old; and I fear that she has been breaking up fast this last summer, for she is not quite like herself. I know that she has been unjust to you, but she set her heart on my marrying Long Dick, and she has been thwarted. If you would bear with her——"

"Say no more, Pleasance," he interrupted her: "Mrs. Balls is your cousin, and was your guardian—that is enough. You do not think that I cannot find room and forbearance for my wife's oldest and best friend?" he demanded, with something like reproach in his tone.

At that moment Mrs. Balls's voice, grown sour and querulous, reached them from one of the many little Manor-house windows, in which her face, dragged and paled from its old comely roundness, appeared framed.

"I dunno, Pleasance, if I be called on to let you please yourself a-stayin' in the garden and a-gettin' on your dead of cold in the wet, with the good ribs on mutton and taties a-spoilin' all the time. As for anybody as is so left to hisself as to keep you a-gossipin' in

sich a shower, I can tell him Long Dick d' be past with the hosses, he do, them ten minents agone; and for as heady as my gen'lleman is, he had better take heed to thatten."

CHAPTER XXIII.—CLEM BLENNERHASSET
FINDS A PATRON.

THAT evening Joel Wray was in the village of Saxford, getting rid of his leisure as he best might. Pleasance had not wished him to be present at the ebullition of poor Mrs. Balls's disappointment when she should hear that what she had dreaded had actually taken place, and that the end had come summarily to Long Dick's protracted suit. An audacious interloper had stepped in lightly and won, in a twinkling, the prize, while Long Dick, in the view of its very value, was still but humming and hawing. Anxiety and hope for him and his ally were alike over for ever.

Joel felt of his own accord, with intuitive delicacy, that he could not, having regard for Mrs. Balls's feelings, be made—as Pleasance's accepted lover, and soon to be her bridegroom—free of the Manor-house at once, on this very first evening. He had as clear a comprehension that there would be no use in trying to decoy Pleasance from her difficult duty of breaking the news to her kinswoman, and striving to reconcile the old woman to what was inevitable. To do him justice, he had only a passing inclination—subdued quickly by his strong, if warped, sense of honour, as well as by his abundant generosity—to wile Pleasance from her mission, in order to bear him company that he might bask in the sunshine of her presence, and forget everything which he was fain to forget in his vivid rejoicing consciousness of what he considered a singular and unsurpassable combination of perfections warranting any struggle and sacrifice. He summed up these perfections in his lover's folly as strength and sweetness, beauty and goodness, simplicity and knowledge, spirit and gentleness.

Joel could not have his natural and chosen companion, and yet he was in the humour for company. He was so happy, and at the same time so restless and excited, that he had difficulty in containing himself. He wanted to have some one to tell indirectly how happy he was, and thus to meet man's first and last need of sympathy.

If Joel's happiness had owned any other source, he would have sought Long Dick, and poured out to him—overwhelmingly, while it was still in a vague and figurative

form, till Pleasance should remove the padlock from his lips—his supreme, intoxicating delight.

In spite of his mercurial and somewhat fantastical and passionate disposition, the lad's liking for the rude, strong, sometimes grossly erring man who had been moulded by that nature, with which he came into closest contact, was altogether sincere. Joel Wray's friendship for Long Dick was so real and friendly, that though Dick was far removed from Joel spiritually, yet Joel was pleased and proud to think that a cherished experiment of his where Long Dick was concerned had signally prospered. The two had not only met on common ground: they had made a paction together, and Joel had achieved a conquest of Long Dick, and disarmed him by disarming himself chivalrously, when the men's interests had clashed on the tenderest point. But all the more Joel shrunk from being himself the bearer of the earliest tidings of that triumph which, however softened in the telling, must be next to a death-blow to Long Dick. Long Dick would not be flesh and blood if his immediate impulse did not prove more or less bitter. Yet it was not the resentment from which Joel recoiled: it was the misery under the resentment, which the lad could not think of and preserve his own elation, and which seemed to give Long Dick a lasting claim on his more fortunate comrade.

In the circumstances, and the dire dearth of all other companionship, Joel suddenly be-thought himself of Pleasance's friend Lizzie Blennerhasset's hobble-de-hoy brother Clem and his musical gift, of which Joel had been certified by more than hearsay, having come across the boy and his music occasionally. He recalled a half-formed intention which he had entertained in reference to the rustic genius. The better day the better deed, and Joel was prone to mark this happiest day by some special act of kindness to one of those fellow-creatures for whom he entertained so warm a good-will. The notion did not proceed from his having any decided musical faculty, though he had a smattering of musical as of many other kinds of knowledge. The inclination to exert himself on Clem's behalf was rather the result of a peculiar inclination on Joel's part at this period of his life, and probably to be modified at a later date, by the disenchantments and disappointments of experience, to play the envious rôle of a little providence to the dwellers in any world in which he happened to be moving.

Pleasance Hatton, on the first receipt of the information that she would succeed to a little money, had betrayed a similar inclination, showing the fellow-feeling in this, as in other respects, between the young people. But Pleasance's was an extremely modest and tame version of the malady, compared to the aggravated form under which Joel Wray laboured.

In the course of the showery evening, which in his present frame of mind was so balmy in its showeriness, Joel wended his way to Saxford, and to those central strongholds of the village, smith Blennerhasset's forge and the Brown Cow.

The rain did not prevent the usual lounging evening visiting of Saxford, and as he passed the shed with the forge and the open door of the smith's house and family room he looked in and saw that on this occasion the Blennerhasset's premises formed the great gathering-ground. Knots of men in smocks and aprons stood round the brawny smith on the glowing smithy. The house-place had also its circle of frowsy matrons, with clutching children, and slovenly young women—whose sole finery at the present moment was resplendent brassy earrings flashing with bits of coloured glass—met about long, lank, chattering Mrs. Blennerhasset and her bouncing, buxom elder daughters.

The discussions in either case were so engrossing that Joel passed without notice, and entered the Brown Cow, where he found that host Morse and his hostess were absent attending the two evening assemblies next door.

For a like reason the bar was tenantless, save for a yawning, dawdling girl, who had not even the old lame potboy to cheer her. The appearance of the smart, saucy day's man up at the Manor, "as was puttin' out Long Dick with Madam," afforded an agreeable diversion, though Joel did nothing to justify the sensation beyond asking the girl in his pleasant way to call out Clem Blennerhasset and his fiddle, if they were next door, and ask if he would come and sup with Joel Wray, and play him a tune afterwards.

Clem, who was less than nobody in his father's house, was soon forthcoming, and very ready for the supper, though it was limited to a rasher of bacon and a glass of ale, to which Joel sat down with his appetite taken away from him by sheer happiness. When the two were left alone, by the girl's withdrawing after clearing away the relics, Clem was ready to play on his beloved fiddle

to a young man who formed an attentive and appreciative listener, after the audiences to which Clem was accustomed. These were domineeringly patronising and fault-finding, but largely indifferent, roaring out their conversation in the very act of beating time more obstreperously than when they were fairly dancing, and caring only for a thrumming din and for familiar country airs, the salient points of which were often guiltless alike of melody and harmony.

"What 'ould you 'a?" Clem questioned, expecting, however, that Joel would say, as on former occasions, "Whatever you like," while Clem proceeded with his tuning, which Joel—so benevolent was his frame of mind—gulped down without so much as a hasty injunction to bring it to a speedy termination.

As Clem spoke and tried his fiddle, his pitted, purple, puffy cheeks shook with intentness, and his small piggy eyes began to glow—caught away as he was for the moment from all his other attributes and surroundings, and raised to a height to which neither Long Dick nor Joel Wray nor Pleasance could climb.

The lad was dimly conscious of the transforming power, and cherished the consciousness in the silent drudging life which he led as his father's assistant, of the reality of his gift, and his loyalty to it. "Nowt but a fiddler," smith Blennerhasset and his wife would tell each other in angry mortification at their son and heir's degeneracy. "He 'ont be nobry at the forge, he 'ont, and he might 'a been sich another strapper as Long Dick. We done nothing to 'a stunted mites and odds and ends on children. As for poor Liz, it were the Lor' and the fire as done it, and no more to be said. Her hev done her best for her livin', if her were not sich a main love-sick fool along on Long Dick, as it could never be thought would cast an eye on a poor limpin' sparrer like our Liz, more by token he's boun' hand and foot to Pleasance Hatton up at t' Manor. But Clem, he d' be as broad as he is long, and he might 'a cultivated the strength on his arm and the cuteness on his eye, and been summot on a man. But, tell'ee what, master" (or "missus," as it chanced to be the smith or his wife who was lamenting), "he'll be nowt but a fiddler, as will fiddle at marriages and bean-feasts, and if his sight fail, as seems the way on fiddlers, he will be led through the country at the tail on a dawg."

This was the most cheerful prognostication that Clem ever heard from his friends of his future career, if he would be so infatuated

as stick to his fiddle, which they did not forbid, nevertheless, because, being a working man's son, he had a young working man's early emancipation and responsibility with regard to his lot, and Clem stuck to his fiddle, while in the very sticking the evil prognostication lost much of its terror.

"I wish you to play something melting and joyous at the same time," enjoined Joel, "something that will dissolve a man's soul within him, but dissolve it in bliss, you understand, Clem."

"Bor!" exclaimed the lad, staring, "I thought as you were riled along on those drowned sailors at Cheam."

In fact, Clem's impression had been that he was called, as David had been called to Saul, to drive out of Joel a dark spirit, of whose existence Clem had been further convinced by Joel's saying little—for him—and eating less.

"So I was, Clem," said Joel, passing his hand across his face, "but something else has come to me. Moods change, as you musicians should know."

"I know," said Clem, volunteering an elucidation of the subject in question, "as how the bands on the sojers what go playin' at a funeral the 'Dead March in Saul,' arter grave is dug and volley fired, turn their fifes and drums to 'See the Conkerin' Hero Comes,' and sich like."

"Just so," said Joel, "now fire away, Clem."

"Somethin' as is meltin'," repeated Clem, half aloud to himself, and tucking his fiddle under his chin, he drew his bow to the air of the "Maid of Allan Water."

Joel listened to it, lying back in his chair, crossing his arms and half closing his bright black eyes. But he had a grave fault to find. "That is very sweet, I don't deny it; but it is profoundly sad, you young shaver, in place of being cheery as the day. It is like a night instead of a morning song. Ain't the words doleful, too? Don't they run somewhat in this fashion:—

'But the summer grief hath brought her,
And the soldier false was he?'

No, no, that is not the thing at all. Try again, and succeed better this time, else you will crack your credit with me."

Clem's faculties were all concentrated in his musical gift. Apart from it, he was a slow as well as an uncouth, though not a silly boy; but when the appeal was made to him through his peculiar genius, he ended by responding to it. A queer, comical sparkle

of intelligence lighted up his ordinarily plain, dull face. "I weren't told it 'ud come to thatten, but will this suit you?" and he struck up the wildly jovial strains of the Scotch air, "Fye, let us a' to the bridal."

Joel laughed gaily, though he still shook his head. "That is a great deal better, but still that is not the thing, my boy. Can't you combine the feelings of the two? If you could play Mendelssohn's 'Wedding March,' now that is about it."

"I 'a heard tell on Mendel—you knows what, it d' be a foreign fangled name," apologized Clem, with quiet confidence. "Owd Stenhouse, as learned me, he could play summat as he said, Mendel—dang the rest, made for the violin to be played by one David—there be a sensibler name as any man can say."

"Ah! that reminds me not to forget your business in my pleasure. Should you like to be a real musician, Clem? I mean, should you care to cut the forge, and give yourself up to your fiddle practising, and to master it so as to be able to make your bread by it, and to play it as well as Stenhouse, who taught you? Do you care for it enough to give yourself up to it like that?"

Clem had no difficulty in following Joel. Wray here. A mixture of eagerness and fearfulness came into the lad's face, while he pushed nearer to his companion, nervously fingering the fiddle-strings with his thick, but in this instance flexible, fingers.

"Mor'er and far'er both say I'll end by bein' nowt 'sept a fiddler, and think to fright me with the lowness and the hardships afore me in that line. But I'm none frightened or even worried when they nag so. I s'pose I do be low and that; for, bor, d' know, Joel, I'm most sure I 'ud like it, if I were let play my heart out and do nowt but fiddle, though I 'ud 'a to pay for it by makin' my arm flee and my ears buz, and them a roarin' at bean-feasts, and though I were to go blin' in the end and be dragged by a dawg. Tell'ee, man, I 'ud choice it afore I 'ud be the most strappin'est, flourishin'est smith, like far'er, if so be I 'ud to buy my rise by givin' up my fiddle. There!" And the boy panted and glared defiantly at Joel as if he had been driven into making the most audacious and dreadful declaration on record.

"But that was not in the least what I meant, Clem," said Joel, stroking the down on his own upper lip encouragingly. "I meant that you might so learn the fiddle, and come to play it, perhaps to teach it in your turn, as to earn 'a fair maintenance, and occupy

an honourable position, certainly quite as honourable as that of the stoutest smith who ever shod horse or struck hot iron. You are not singular in your love of music. There are well-paid musicians, and those who are thorough gentlemen, such as your friend 'Mendel-dang-the-rest' was in his days. There are schools for music—not so many as there ought to be, and will be, but still a few, as there are schools of art, medical schools, and mining schools—where young musicians are reared and trained."

"I 'a no stomach to be a gen'leman," pronounced Clem decisively. "I ain't fit, nor never will be."

"That's the second time that I have heard the same sentiment in one day from two very different sources," thought Joel, meditatively. "I wonder if the world is getting wiser, and the plebeian is ceasing to envy the patrician, nay, if in his superior simplicity and philosophy the pleb has come to the conclusion that he has got the best of it? I wonder if Ruskin's Arcadia is about to have a trial, and if so, shall I have graduated for a post in it?"

"I 'ud leave the gen'leman business to a smart town-bred chap like you, Joel, as is part gen'leman a'ready," concluded Clem.

"Thanks." Joel acknowledged the compliment sedately.

"But about them schools," pursued Clem, roused out of his stolidity, and keen on the idea which had been suggested to him. "Stenhouse, he said nowt about 'em, but they mightn't 'a been in his day. Be there smith's work ever wanted there, as a feller could do in exchange like?"

"I fear not, Clem, unless it were such delicate mechanical work in relation to musical instruments as you could not attempt."

"Not messagin', nor cleanin' on knives and shoes, nor nowt as I could turn my hand to for my keep, and just a lesson nows and thens?" besought Clem, with the painful urgency of a man whose hopes have been raised only to have them dashed to the ground.

"No, I am not aware that they have an equivalent for the old university servitor in the modern musical academies," said Joel, speaking out his own thoughts rather than setting himself to enlighten Clem. "But cheer up, young one, don't look so blank, I'll engage that you'll find a way. The thing would be for you to go up to London and stand an examination, and if you passed, and were approved of, I have a friend that has some-

thing to say in an academy of music, and that could give you a list so that you might be taken on free till you had accomplished your curriculum, or whatever they call it. Do you take me, Clem."

"Free sich as in our 'ospital?" suggested Clem.

"All right," said Joel.

"But far'er 'ud never give me money to go up on sich a wild-goose chase to Lunon," said Clem, beginning to sink back into despair. "And mo'r'er 'ouldn't hold at he, as she do when the mawthers do want help for an outin'. I might run off and beg my way, but I could never ask as a beggar—not so much as a bit on rosin to make the bow go—when I were a little chap, and just beginnin' to play. It would be mortal hard to ask now, with the sight and 'athout the dawg, yet—even for the fiddle."

"Here you are, Clem. I'll lend you the small sum necessary, from my wages, or rather from my savings," offered the lavish Joel.

"I'm a Dutchman!" exclaimed Clem, with unceremonious abruptness and incredulity, and he proceeded to inquire with an equal absence of hypocrisy, "Dev you 'a savings? I thought—we 'a all thought, you was a hand-to-mouth buffer."

"You have all thought wrong, then," said Joel composedly.

"Wunno you need your savin's then?" Clem continued to ask anxiously, still perplexed as well as dazzled by the splendour of the offer, and showing commendable consideration for the welfare of his rash friend, "if so be that you and Pleasance—wunno our Liz be mad as Long Dick is thrown over, though it d' be grist to her own mill—make a marriage atween you?"

"Never fear," said Joel. "But I have never said anything of making a marriage with any lass. Mind, I have not said it, Clem."

"But you a looked as if your heels were uppermost," said Clem, with unlooked-for severity of satire. "Sittin' a grinnin' there from ear to ear, kinder-like a snake, and as if you were swallowed up with pride; and you d' be a thrustin' your shillin's right and left on a wumblin' lad as be'nt a drop's blood to you, and as 'a on'y knowed you slight, to nod to and play a tune to, till this blessed night."

"You are a deep one yourself, Clem, deeper than I took your for. But have you never heard of 'village Hampdens,' and 'mute inglorious Miltons' (Handels and Haydns would be more appropriate in this

case), and of folk being so possessed as to desire to draw out the compulsory dumb, and win for them speech, hearing, and a reward?"

"If you mean a reward on fiddlin'," said Clem, scratching his head, "all the reward

on it as a not come from its own guts, that I 'a found, were worritin', and when I were younger, and not like to keep my own head wallopin'."

"There's a good time coming," said Joel, rising to go.

IN TOWN.

(Pantoum.)

"The blue fly sings in the pane."—TENNYSON.

GRINDING in town now is "horrid,"
(There is that woman again!)
Sun beating down on one's forehead,
Thought gets dry in the brain.

There is that woman again:
"Strawberries! fourpence a pottle!"
Thought gets dry in the brain;
Ink gets dry in the bottle.

"Strawberries! fourpence a pottle!"
O for the green of a lane!
Ink gets dry in the bottle;
"Buzz" goes a fly in the pane!

O for the green of a lane!
O to lie down and be lazy!
"Buzz" goes a fly in the pane;
Bluebottles drive me crazy!

O to lie down and be lazy!
Careless of town and all in it!
Bluebottles drive me crazy:
I shall go mad in a minute!

Careless of town and all in it,
With some one to soothe and to still you;
I shall go mad in a minute.
Bluebottle, then I shall kill you!

With some one to soothe and to still you,
As only one's feminine kin do;
Bluebottle, then I shall kill you:
There! I have broken the window!

As only one's feminine kin do,—
Some MABEL, or ETHEL, or GRACIE!
There! I have broken the window!
Bluebottle! *abi in pace*!

Some MABEL, or ETHEL, or GRACIE
To dash one with eau de Cologne;
Bluebottle! *abi in pace*!
And why should I stay here alone!

To dash one with eau de Cologne,
All over one's talented forehead!
And why should I stay here alone!
Grinding in town now is "horrid!"

AUSTIN DOBSON.

ON SOME SPECULATIVE PERPLEXITIES.

BY THE EDITOR.

IT has become so trite an observation to speak of the time in which we live as a period when all received creeds are put on their trial, when each man is supposed to think for himself, when every authority must expect to be challenged by stripling as well as savant, that it need not be repeated here, except for the purpose of leading to something more practical than a superficial description of the spirit of the age.

But however trite the observation I have quoted, however much it has become a sort of cant in some lips, it nevertheless expresses a fact of profoundest interest. No thoughtful man can contemplate the present condition of things without intense anxiety. We are in the midst of one of those formative epochs in the religious history of the world, out of which we may expect great good to come, but at present it is intellectual chaos. Men refuse to be guided by the old landmarks, and many of the cherished beliefs of the last generation are classified among baseless

prejudices or sheer mistakes. The universal ferment of opinion is acting as a solvent upon every species of authority.

Yet we ought to remember that there have been many similar epochs in the history of thought and of religion, and experience may teach us hopefulness in regard to the final issue. Of such a nature was the period of the breaking up of the Roman empire, and the conflict between the forces that were gradually retreating from the field and the creed which was soon to spread over Europe. The time of the Reformation was another era of confusion and warfare, out of which grew progress and enlightenment. The deistical controversies of the eighteenth century, ending with the French Revolution and the universal turmoil of political and religious opinion which was its immediate consequence, was also an age fruitful in blessing, but which at the time seemed alarming and perilous. And if there is in the present day a deeper and wider movement than can be

paralleled for centuries, yet let us thank God there is also prevalent a healthier spirit of truthfulness and reverence in those who profess to be the leaders of new thought.

All these discussions have naturally an unhappy effect on certain minds. There are many people too busy to study out for themselves the questions of the day, but who cannot help catching what I may call the infectious spirit of uncertainty. Whether they can give a reason for it or not, they experience a sense of uneasiness and insecurity. They cannot read the daily papers without finding assertions made on this subject and on that, by men of influence and acknowledged scholarship, which clash with many sacred beliefs. Scientist contradicts scientist, critic contradicts critic, new theories of creation are propounded one day, to be overthrown the next. The impression alone remains decided, that a great part of the thinking world is at sea upon some of the most important questions. What, then, are men of the ordinary type to do? Life is too short, and they are too busy to study out a new theory of the universe; and yet they cannot afford to be in darkness. That would be too miserable! How are they to act? Are they to remain in suspense respecting matters which have the closest, most intimate relation to their affections, their hopes, their very being, until the nature of atoms or of protoplasm has been determined? Must they be in doubt regarding immortality, be uncertain whether their dear ones are alive or have perished, hesitate between heathen darkness and Christian light, until they have formed, each for himself, a conclusion respecting the authenticity of the Gospel of St. John, and sifted all the attempts that have been made to show that it is the production of an age which has certainly left nothing even approximating to it in majesty? If not, what then are they to do? Where are they to begin, or where find a satisfactory basis for their position?

Now, far be it from any Christian teacher to look with suspicion on the labours of those who are seeking truth, and who have already added so much solid and reliable ground to the region of knowledge. What has already been accomplished has widened enormously our horizon, and cast new light upon the character of the material world and the manner in which it has assumed its present condition. There may be in the ferment of ideas which novelty stimulates much that is fanciful, even ridiculous; but what remains of substantial truth is undoubtedly

exceedingly suggestive, and inspires the hope that science will render powerful assistance in understanding the scope and meaning of holy Scripture.

The question I now propose has no reference to the truth or falsehood of the attacks so frequently made on certain familiar beliefs. Let us take the case of a man of ordinary intelligence, who is too busy with the practical affairs of life to go deep into the problems that are puzzling the age; who hears the sounds of battle raging around positions he has been accustomed to regard as unassailable; and as he learns that some outwork, built long ago, round the citadel has been abandoned, begins to feel insecure, and asks for a position which may assure him some legitimate peace until the war is over and the lines again become definitely settled. Where, then, is such a man to begin? What is he to do?

This is not only a very wide question, but I am persuaded it is a very pressing one; and among many other replies which might be made to it, there are two distinctions by the observance of which some help may be found towards its practical solution.

1. The distinction between theology and religion.* Every man ought to be religious, but every man need not, nay, as things are, cannot, be a theologian. No man is therefore compelled to wait till all theological dogmas have been settled before becoming religious. If religion is to be the common property of man, possible for the peasant as well as the philosopher, its essence must be looked for in what is simple, not complex, in the practical rather than the theoretical. However important theology may be, its position in reference to religion is very much that of chemistry or physiology in relation to the practical enjoyment of physical health. A man does not require to know the nature of oxygen in order to breathe the air of heaven, nor does he need to study physiology before eating his daily food. There are natural tastes, appetites, experiences, which together form a sufficient and easy ground for guidance, so that every sane man can act without hesitation in these common matters, without waiting for the instruction of science, or the establishment of some theory of life. In like manner there are moral affinities and spiritual desires, a sense of duty and of right and wrong, a perception of the beauty of holiness, an instinctive feeling of responsibility, and of

* See a suggestive sermon on this subject by Principal Tulloch, "Religion and Theology," Messrs. Blackwood and Sons, Edinburgh.

dependence upon God, which form a sufficient basis on which to construct a truly religious life. It is not necessary to master the arguments for Theism before believing in the existence of a God to whom we are responsible. Our nature is so constituted that the consciousness of God is one of our first instincts. The statement of sin and guilt, the assertion of moral confusion, of the strength of passion, and of the misery of evil; the message of a Father's love, of His readiness to pardon; the picture of the beauty of holiness and the promise of help for its attainment—these things appeal freshly, with a self-evidencing and convincing power which overleaps the scientific methods of theology, and goes at once home to the heart and conscience of humanity. The man who lives under the power of these influences, whose conscience is open to the dictates of righteousness, whose heart responds to the love of God in Christ, whose desires go forth towards the things that are "true" and "lovely" and of "good report," who recognises himself as an immortal and responsible being, and who takes his place as a child towards his Father in heaven, and as a brother towards his fellow-man on earth—the man who so feels and endeavours, is a religious man, although numberless questions, in themselves full of deepest interest and importance, may long remain for him not only unsolved, but without the problems they involve having ever once suggested a difficulty to his mind. It is well, therefore, to distinguish between the religious life which is incumbent on all men, and the scientific or theological information which must necessarily belong to the comparative few.

2. Another principle, the observance of which may be of some use to those who are disturbed by the agitation of opinion in regard to many familiar beliefs, may be thus familiarly expressed:—*Begin at the centre, and not at the circumference.* There are a thousand intricate questions lying round about central truth, questions that are not vital, but which have been so much associated with vital truth that their discussion is sometimes made to wear a far more portentous aspect than really belongs to them. For example, many minds have been so trained under traditional teaching as to imagine that the truth of Scripture is involved in the theory of verbal inspiration. They have been so drilled by the pulpit to regard every word of Scripture, whether it be the genealogy of a priest or a numeral in Chronicles or Kings, as given by direct inspiration—dictated, in short, by

the Holy Spirit—that they fancy revelation itself is imperilled when a Colenso shows some arithmetical inconsistency, or when a Strauss proves the existence of verbal discrepancy.

In like manner there is a large class among those who read modern literature who fancy the Christian religion itself is being imperilled when science challenges the historical accuracy of the Mosaic account of the creation. They fancy the glory of the Gospels must vanish and Christ cease to be true, except we believe the world created in six literal days, or in six epochs, or by means of sudden cataclysms and repeated manifestations of fresh creative energy. They see an antagonism so direct between any theory of development and Scripture statement, that, to their imagination, all religion must totter to its fall should Darwinism be proved true.

Now without discussing—far less conceding the statements of Scripture on such matters, it is sufficient for our present purpose to notice that all such questions lie at the circumference, and far away from the purpose of divine revelation.

Once upon a time the Church, in its great blindness of heart, its prejudice and ignorance, deemed that the very existence of the faith depended on such poetic and popular statements in Scripture as seemed to indicate that the sun rose and sank, that it revolved round the earth, while the earth abode continually, firmly established upon the floods. We now, without any effort, perceive how far such questions are removed from the real centre of religious belief, and with what safety and freedom they can be handled without any danger accruing to Christian life. In like manner we need stand in no terror of any light which modern inquiry may throw on the conditions,—the length of time, or the process of development,—under which the material world and the varieties of vegetable and animal life may have possibly reached their present state. We must not identify the authority which belongs to the Sermon on the Mount with such questions of criticism as whether Moses wrote the Pentateuch, whether the book of Job is a history or a drama, whether the account of the Garden of Eden is meant to represent actual fact or is an allegory, or whether the massacres perpetrated by the Israelites are in accordance with the Gospel. In whatever way such questions as these are finally determined, I believe it is absolutely necessary for us, in the meantime, to recognise their

true position, as lying wholly at the circumference, and as connected only in a secondary manner with the truth or falsehood of the Christian religion. Once we get a firm hold of the centre, once we are securely anchored to the eternal verities, then we may not only with safety, but with profit, deal freely, frankly, gratefully with minor matters of criticism, or with the interesting discoveries of scientific research.

What, then, is the centre? I answer without hesitation, Jesus Christ—or, in other words, “the light of the glory of God shining on the face of Jesus Christ.” That is the true point at which every man calling himself Christian ought to begin. Numberless problems may continue to exercise the minds of men as the horizon of knowledge becomes widened, and as God reveals the order, the greatness, the beauty of His works in a measure far exceeding anything given to ancient prophet or historian. But there is one revelation, supreme, central, and, as regards our spiritual condition, decisive in its issues; and that is, the goodness, the divine truth and excellence of Jesus Christ. It is here we must begin, as it is here we derive the most convincing evidence for Christianity. Whatever theories may be devised as to the origin of physical life, they cannot affect the impression we receive of the eternal fitness and truth of what Jesus Christ was and did. As we stand in His presence, or follow His footsteps and trace that sinless life of His, passing without stain through every human experience, or when we listen to the gracious words that proceed out of His mouth, as He invites the weary and the heavy laden to come to Him for rest, or tells us of a Father who loves us and seeks our good—there is a world opened up of spiritual glory which shines with its own light, and is its own best evidence. That which has really convinced the world has not been the arguments derived from the circumference into which the scriptural history extends. That which filled the hearts of Apostles and Martyrs with their holy enthusiasm; that which has nerved the hearts of feeble women with a heroism which defied death and torture; that which has shed peace on troubled consciences, which has been the comfort of the sad, the allurements of longing souls, the satisfaction, the life, the all-in-all, of the Church in every age, has been Jesus Christ Himself in His truth, His

love, His holiness, His ministry of healing, His sufferings and death and resurrection. We do not need to go through an intricate theological education; we do not require to determine the nature of protoplasm or the merit of some theory of evolution, before we can confess the truth of Christ's parables or the glory of His cross and passion. Wherever there is a true spiritual eye, it is enough simply to look there and see. The light shines, and the spirit of man, unless utterly blind, is bound to confess its glory. Let critics discuss the extent of inspiration; let theologians philosophize regarding many important mysteries of the faith; let geologists examine the age of the earth's crust; let physicists reverently trace the manner in which organized life has been developed; but the man who with true heart reads the Gospels, does not need to wait the result of such controversies. Such a man feels that Christ speaks as no mere man could speak; that, whatever inspiration means, verily He has the words of eternal life; that, however the Athanasian Creed may be attacked, Christ was in the most awful sense divine; and that, whatever explanation may be given of atonement, he cannot look at Gethsemane and the Cross without receiving such a sense of the love of God, of the evil of sin, of the fulness of forgiveness and mercy to the utmost, which nothing else can convey, and which no arguments from the outside can shake.

And so would I, in conclusion, address those who are often perplexed by the speculations, the assertions, the confusions of the time, and say, Do not confound religion with theology, do not begin at the circumference instead of the centre. Begin with Jesus Christ, your Friend and Brother. Hear what He says about sin and redemption, about death and life. “O taste and see that the Lord is good.” Try to live the life, possess the truth, accept the love of God in Christ. Acquaint yourselves with His mind, His ways, His righteousness and tenderness unspeakable; and you will in your own experience possess an evidence which no merely external objections can reach. You will have a witness in yourselves so independent of other testimony, that you can address theologians and scientists with the old words of the Samaritans, “Now we believe, not because of your saying; for we have heard Him ourselves, and know that this is indeed, the Christ, the Saviour of the world.”

TO HIS MISTRESS.

(FROM THE GERMAN OF HEINE.)

WHAT do the violets ail,
 So wan, so shy?
 Why are the roses pale?
 Oh why? Oh why?

The lark sad music makes
 To sullen skies;
 From yonder flowery brakes
 Dead odours rise.

Why is the sun's new birth
 A dawn of gloom?
 Oh why is this fair earth
 My joyless tomb?

I wait apart and sigh,
 I call to thee;—
 Why, heart's beloved, why
 Did'st thou leave me?

FREDERICK LOCKER.

NATIONAL HEALTH.

CHAPTER I.—AN OPENING PAGE.

MOVE with me. I will not pretend to avoid details which some may consider uninviting when they are first named; but I will do my best to make details as little wearisome as possible. And this shall be common to them all, that they shall relate to the best and dearest interests of those who read. This essay refers to the subject of the national health, and thereby to the national life, and, again, thereby to the national prosperity, for national health is national wealth. We, an insular people, take a just pride in that national property, the navy. Our grandparents learned, from one of the popular school catechisms of their day, that the founders of the English nation, "cut off by sea from the rest of the world, became mariners, at first from necessity; but what at first appeared an inconvenience, turned out in the end so much to their advantage, that they at last were acknowledged by all nations to be the indisputed lords of the ocean." One of our powerful morning papers has lately in other words repeated the same. "Were we to publish every morning the declaration that the very existence of Great Britain depends upon her fleets, it would be the iteration of a truism, but the most useful one that could be got by heart."

For my part I think, with all respect to the ancient and the modern writer, that there is another national interest which has, or ought to have, precedence even over that which attaches to the fleets. I mean the life that yields the force of the fleet. Of what use is it to give outward protection to the island, to surround every inch of it with walls of iron, unless the inner, the force of life—the force of life which lies behind these bulwarks of the sea—be carefully and effectively preserved? Our national strength is vital; it is in our homes before it reaches our ships; it is in ourselves, not in our cannon, which are but the thunderous mouth-pieces of it. If it be not maintained, all external protection will be of little ultimate value in the face of opposing nations that shall learn to combine, with the acquirement of civilised progress, an advance in healthiness and productiveness of life in human forms. Before such developing prowess, mental and physical, all dead resistance, whatever its weight, whatever its bulk, will be of poor avail unless it be vitalised

in proportion to its weight and bulk. A whale with a harpoon in its back, giving up its mighty strength to half-a-dozen men in a cockle-boat, whom it could lift into the air with a frisk of its tail if its vitality were intact, would be the simile.

Our present condition and position as a nation depend entirely on our national health, and on the endurance and progressive force of our national vitality. Weak communities, criminal communities, beget their like; strong communities, moral communities, beget their like; and weaker and wickeder, or stronger and better, are the steps onward, according to the direction primarily taken. Health is necessary, in short, to make health. This is the first principle in the primer of the physician.

To have health we must first make it. It comes, we say, by nature; it departs also by the same channel. It is correct to say that it comes naturally from the observance and application of certain rules which we have learned; but it also goes naturally whenever those rules are broken or disobeyed. If a man eat animal food that is free of animal parasites, it is natural that the food should build up his muscles, and help to sustain his life. If a man eat animal food infested with parasites, it is natural not only that the food should build up his muscles and sustain his life, but that the parasite he has taken into him should develop and increase within him, should live on his vital organs, and kill him outright. Ergo, he who would subsist on animal food and preserve his health must learn something beyond the experience that animal food will sustain him. He must learn, in addition, to avoid food containing parasites. He must, also, by continuance of the same acquirement of precepts of health and other rules of pure art derived from human experience, learn many other truths; but the example I have given will suffice at this moment for the argument.

I employ this illustration and the argument it is intended to enforce because I want at once to impress on the mind that health, national and individual, is something to be acquired by learning, and that it does not come to man by any royal road, as a gift that asks no labour before it is bestowed. The poets have, I know, put before us their visions of Saturnian reigns; of universal health

and happiness in some favoured regions ; of richness, peace, and splendour now unknown. Such poetic visions I am the last to despise. They are the expressed and beautiful associations of finely-attuned souls, whose wishes were fathers to their thoughts, and whose faiths in human progress were the wings of their wise and beneficent desires. But the hard facts in the history of human life on the planet, as they have been passed down to us in reliable readings, offer no evidence of the mortal elysium of the poet. The chapter of the life of the universal man, as it is so far written, is the picture of the man fighting with the elements, and being slain by them, yet having wisdom to conquer them when he has learned wisdom. A picture of a fight with difficulties for dear life ; of a fight to learn how to win ; of a fight in which the knowledge of to-day has been torn down by the ignorance of to-morrow ; of a fight, followed by long waitings for new men and new lights ; of a fight with ebb and flow of success from century to century.

Such has been the struggle of the world of life towards knowledge of life. Such, with diminishing tension, must the struggle still remain until all the world is vanquished by knowledge and that application of it which we call wisdom. With a few exceptions, which indeed hardly amount to exceptions, and which if they did would duly prove the rule, the rule has been that in the transition of man from the savage into the civilised state his health and strength and power have become developed and improved. He has gained experience and knowledge, and he has learned to apply his knowledge with advantage to the progress of his physical existence. The surest and soundest proof of this is that the civilised secondary man has everywhere conquered the savage primitive man. He has conquered because he has possessed more power, more skill, more means. In other words, because he has been physically greater, mentally greater, socially greater, all of which influences indicate that the conquering man is healthier than the conquered. The standard of comparison may be rude or refined, but it is present in some one or other degree.

Owing to the contact of knowledge and wisdom with ignorance and superstition, owing to the fact that knowledge and wisdom, commencing in small centres, have had to conquer all the world,—so far as they have conquered,—and lastly, owing to the fact that knowledge and wisdom have themselves been reached by devious ways, sometimes

combined, and even then very feeble, often alone, and then all but extinguished, it has followed that the science of preserving health, through art, has been slowly perfected, has not indeed until our own time been worthy the name of a science. We may with some profit trace it in its irregular yet onward course from its origin.

THE MEDICAL PART.

From wounds inflicted on man, in his battles with the elements and forces of nature surrounding him, and in his battles with his fellows or with the lower orders of creation, the means for the saving of life first assumed practical form. In the earliest stage of the contest, the men who, in their might, fell from disease, were smitten. They were felled by an unseen hand. The catastrophe was a mystery which could only be penetrated by mysterious learning. Thus arose those learned men who, entrusted with the ministrations of the art and mystery of healing, became the ministers of health. Thus appear the primitive healers who seek not to arrest the hidden hand that struck the mysterious blow, but to cure the injury the blow has inflicted. They enter into secret communion with nature, *φύσις*, for means of cure, and they invent the art, the *φυσική*, the physick. In time they are the physicians.

For many ages the physician remains as he originated, the would-be repairer of the rents and scars of the accident disease. Of necessity he learns much that is useful, much that is beyond all praise ; and in the inspired sentiment of ancient Greek art,—the same art virtually as that which gave us the all but speaking figures of stone and marble,—he is sublimed into immortal form, and “ because he cultivates a rude and as yet vulgar science with a little more subtlety, is received into the number of the gods.”

The physician in this character of the curer is indeed a useful servant of mankind. He is the learned historian of disease, and in unbroken line hands down priceless records of the course of disease. He is the expounder of the scholastic readings of his brotherhood. He observes and writes down the details of different diseases with a care that has no perfect parallel. He seeks amongst all the recesses of nature for remedies against the diseases he has witnessed. He finds a few remedies, in the finding lights upon things he was not looking for, and finds new sciences. Those elements, minerals, plants he touches have properties and qualities which perforce arrest his attention.

He submits them to fire for purification; they yield him products that are entirely new. He subjects them to gentler heat for sublimation; they yield him in condensation other new products which were not before extant in nature. He is a true necromancer now; a professor of the *kimia* or concealed art; and he gives chemistry to the sciences. Those plants in which he seeks for hidden healing virtues cannot pass long before his eyes, nor pass often through his hands without telling him that they have relationships towards each other which look something like the relationships of families, of men, or of animals. Therefore he begins to classify the plants, and the general name of the plant *βοτανή* becomes the name of a science. A bit of the substance we now call amber, picked up on the sea shore, when it is subjected to friction, attracts light bodies, like straw, if they are brought near to it. A bit of iron ore, dug up near the town in Turkey in Asia that is now called Manisa, once the town of Magnesia, attracts iron and confers its own power to other iron. Our physician looks into these mysterious phenomena. The properties of the substance on the sea shore, *ηλεκτρον* (*electron*) as it was originally called, he studies, with the result of finding that the same properties extend to glass and other bodies which being rubbed attract in like manner. To all these substances he applies the original name; he calls them, after electron, electrics; he classifies the phenomena altogether under the term electrical; and, generalising upon the whole, uses the term electricity. The wonderful iron stone, called from the place whence it was derived, Magnes, becomes in his hands a specific instrument, a magnet, and from the study of the magnet springs the science of magnetism.

In dealing with the delicate organs of the body he has to manipulate those parts which lie directly under the hand, so surgery,—*χειρ*, the hand, *εργον*, work,—surgery is added to his labour. He invents skilful instruments for this handicraft, and refines the mechanical arts. He dissects the bodies of the dead to learn the animal organism; unclothes the body to the skeleton; reconstructs the bony framework; founds anatomy; and when the time comes for finding in deep chambers of the earth the preserved skeleton remains of animals long since dead or even extinct, he has prepared the way for another study, which indeed he originates, the science of ancient living things, paleontology. His eyes turn to the heavenly bodies to dis-

cover, as in a book mysteriously opened to him, the destinies of men. Anon, he begins to read the motions of the wandering fires, and his aid is brought to the cultivation of the astronomy of the learned world. In a later day he endeavours to comprehend the functions of living organs in men and animals, to determine the relationships of man to his lower life-mates, of man to man, of life to life, and straightway biology is raised into a special place in scientific systems of thought. Later still he strives to grasp the organic changes which the body undergoes in disease, and in this direction collects a library of facts which, yet unarranged, wait for a reading that shall yield a rich harvest of knowledge to the generations which are to follow our own.

It would, indeed, be hard to magnify the skill and learning of the healer, rendered, as both have been in such great and varied ways, through the ages that have run their course; but he has been the healer purely, and not until these last days, almost our days, the preserver of health. The omission has been his misfortune rather than his fault. He has moved with the world in which he has lived, influenced by its views, guided by its discoveries, fulfilling its requirements.

Men altogether have only recently commenced to look at themselves in their national as distinct from their individual characters; men altogether have but recently commenced to look at anything antecedent to the actual phenomena presented to their senses; so in respect to health they have thought only of their own particular sufferings, and in respect to disease they have considered only the symptoms they have been obliged to witness. To perceive the fact that the national interests cover the individual, and that he who is striving to improve the health of all his brethren is doing the wisest thing to improve his own: to perceive the fact that whenever disease appears it has come into appearance through a well-defined series of causes, many of which are recognisable and removable:—these are the modern perceptions of a few minds, which have to be communicated to the many.

The physician, whom I have traced from his origin, trying to cure diseases with one hand and inventing new sciences with the other, has had enough to do to keep on his laborious way. He might be pardoned if he had been led, rather than had been the leader, in the science of prevention of disease, and in teaching the national aspect of the question of sanitation; for professions,

like persons, are greatly influenced by professed habitudes of thought. It is the business of the physician to cure the evils which the world has inherited or acquired. Why should he go into the questions of cause? The questions raised may be political. Is he to be a politician? They may be social. Is he to interfere with the daily life of his patients, turn their homes upside down, criticize their eating and drinking, find fault with their clothing, instruct them in their working, and guide them in their amusements? Far better were his hands employed in curing diseases with one hand and inventing new and different sciences with the other, as in the olden time. This is the self-interested argument, cutting like a two-edged sword, one edge for the fortune, the other for the art of the healer; a fortune that may be moderately envied, an art in the cultivation of which there is much that is fascinating to the inventive, courageous, and, above all, ambitious mind. All profit, all honour, to him who, having a disease under his care, cures or seems to cure it! No fortune, no honour, to him who waits to cure a disease which science, forestalling herself, has said shall not exist to be cured.

I rejoice to state that the physician, descending through the long line of history I have, by so light a stroke of the pen, indicated, has been true to the greater interests of the world in which he has been cast, and that so soon as the advancement of learning and popular prejudice gave to him liberty of action he began to study the national as well as the individual health; to look at causes of disease; to balance the value of vitality against mortality; to dare to tell his fellows, "You would not want me to cure you if you would learn how, by a few rules,—simple when they are learned, and sources of unknown happiness when they are practised,—to keep yourselves well."

This is the message of the physician as he now stands on the stage of the world to the men and women and children before him.

It would be difficult to say who amongst the healers was first to begin to write the letters of this message. Some of the inspired amongst them of all ages have, like Virgil, sung of the grand days of universal health and happiness that were to come. Others of them have taught, by example, a perfect regimen. Of these the illustrious Galen was the great example. Galen, who in his youth was feeble, but who lived to a good old age, learned, early in life, so to govern

himself that he allowed nothing to disturb the serenity of his mind, and never raised a hand to correct a slave. He carefully studied what aliments and exercises best suited himself and adhered to these; he taught his followers never to degrade themselves to the level of the brute creation by eating and drinking whatever pleased them, or by indulging in sensual appetites; and, he tried to teach all persons he knew, whether they were wise on the subject of physic or ignorant of it, how they might, by the careful management and purity of their lives, so live that physicians and remedies would be to them alike unnecessary. In later days the Arabian schools of physic had their teachers of regimen; and since the revival of letters there have arisen at intervals such men as Arbuthnot, Hoffman, Hufeland, Haygarth of Chester, and Cheyne, who, following the thought of Plato, have entertained the belief that the very existence of physicians in a republic is a proof of the vice of the people.

One other idea has also filled the minds of all these advanced scholars and masters,—an idea in which they and many others not less eminent have joined with one accord,—viz., that health and happiness are synonymous terms: that he who fears to limit himself to those wants and methods which keep his body in perfect order, lest by so limiting his desires he should lose some pleasure in which he thinks his happiness is involved, is a deluded man: that he who trusts to the health of his body, and thereby of his mind, for his serenity of life, and for the full development of the pleasures that are to be found in life, is the wisest of the wise and the happiest of the happy.

Step by step the mind of the healer thus became opened to new thoughts, and as the change occurred new views offered themselves to his comprehension which led him into details as decidedly practical as any that related to the older subject of cure. An enlightened Italian physician,—and it is wonderful how indebted the world is to the Italian schools of physic,—one Ramazzini, commenced a century and a half ago, nay, nearer two centuries ago, to study the effects of the labour of artizans on the health and vital value of the labourer. He specially studied the kind of labour that is carried on in flax working, and defined the evils of that occupation with a degree of accuracy which has not been surpassed. He was followed by many more in the same line of research, and in the present century, through the further exertions of Thackrah, and other

observers, we have arrived at a very clear idea of the influence of industrial labour on health and life. The knowledge that has thus been brought forth has culminated during the present year in the production of a series of statistical facts, collected under the direction of Dr. William Farr, from which the relative values of life in sixty-nine well-defined occupations have been compared by a certain standard of general life, and results have been obtained which are unexampled of their kind. I shall have occasion to draw special attention to these results in a future chapter. From the same Italian physician of whom I have spoken,—Ramazzini,—there dates largely another advance in this project of preventive medicine. To him we owe an early suggestion for making observations on the relation of weather and season in connection with diseases, and particularly with diseases which take the epidemic or spreading type. Before the time of Ramazzini, other men had touched on this subject. Hippocrates himself must be credited with much that is ingenious and useful, and our own English physician, Sydenham, who flourished in the time of the Commonwealth, must be remembered. But Ramazzini gave the direction to progressive thought, and even organized a society for securing the continuance of his design. In the past fifty years the Ramazzinian mode of investigation has been marvellously developed. Learned societies, such as the Epidemiological and Meteorological Societies,—both groaning under viciously hard names, by the way,—have been founded, and a varied number of useful truths have been elicited. Three examples of these are sufficiently curious and important to be noticed. It has been discovered that the body of the living man begins to lose in weight at a certain season of the year, and begins to gain in weight at another season. It has been discovered that certain diseases show a maximum or minimum of mortality at particular seasons. It has been discovered that with a given fall of temperature of the air, a proportionate number of persons die according to the period of their ages, the deaths doubling in number, under the same degree of exposure, with each addition of nine years of life amongst those who have passed thirty-nine years of age.

The progress of the preventive system of meeting diseases has been advanced by yet another medical means. I refer to the *accidental* observation and application of observation by men of genius and courage, who have been educated in the ranks of medicine.

Among these men of genius, who have thus accidentally learned, the first place must be given to Jenner. He observed that the process of vaccination prevented the communication, and therefore the spread, of small-pox. We in this day are, happily, quite unable to estimate the value of Jenner's discovery directly or indirectly. It stayed directly the ravages of the most loathsome disease that was ever known. It stayed indirectly, in proportion as it stayed the disease itself, all the many and terrible secondary consequences which follow small-pox, such as deafness, blindness, affections of the bones and joints by which the body was crippled, eruptive diseases of the skin and fearful disfigurements of feature and form, with, in some instances, development of those organic and fatal changes to which the names of struma and consumption are applied. In countries where vaccination has been thoroughly carried out the disease, small-pox, may be said to have become all but unknown; and it is to be hoped that in time the disease may be entirely abolished, and that the preventive measure which has so singularly controlled it may pass, if not out of memory, out of practice.

In the study of other great pestilences such as typhoid fever and cholera, physicians of modern times have made many advances towards arriving at preventive means; but for none has so happy a discovery been elicited as that of vaccination for small-pox.

From another branch of study started within the ranks of physicians has been derived the statistical method of research which of late has yielded important results. The brilliant Arbuthnott, the accomplished friend and companion of Swift, Hogarth, Pope, and other members of the galaxy of wit and wisdom of the reign of Anne, he to whom Pope wrote, "You are fitter to live or to die than any man I know,"—he in the earlier part of his career wrote to the Royal Society an essay, entitled, "An Argument for Divine Providence, taken from the constant Regularity observed in the Births of both Sexes." In this paper Arbuthnott showed that there is nearly an equality in the births of the two sexes, but that as the mortality of males is greater than that of females, so in a slight degree more males than females are born into the world. To illustrate his point, this learned author included in his paper a table of the births of both sexes occurring in London from the years 1629 to 1710.

From the research thus established by Arbuthnott dates properly a method of

numerical calculation which has largely influenced the modern scholar in his studies of the values of life and of the mortalities which accrue from particular forms of disease. I may say that the science of vital statistics dates from this communication, and we shall see as we progress what an important part this science plays, and has yet to play in the course of sanitary work and in the study of the national health.

When once the intellectual powers of a class of men are directed to a given object, they turn in so many directions it is difficult to thread the history of them without entering into such minuteness of description as would be out of place here. It is impossible for me to relate what the physicians, departing from their primitive work, have done towards conserving the national life by their exposure of the dangers arising from over-filled graveyards; from over-crowded gaols, workhouses, and asylums; from bad ventilation; from diseased foods and impure water; from imperfect drainage; from introduction of poisons into food, air, and clothing, and from sundry other causes. Suffice it if I have conveyed a fair idea of the important primary part which the early communers with nature, the physicians, have played in the study of the national health, and of the general mode by which their minds have been directed towards one of the latest of the useful triumphs of practical science.

THE PHILOSOPHICAL PART.

To the precepts of the wise professors of the healing art must, in justice, be added those of some other men, who are called, *par excellence*, the philosophers. All the philosophers are in some degree worthy of recognition as promoters of national health. Æsop's fable of the belly and the members is an admirable sanitary lesson. Seneca is rich in wisdom on the subject of health, and I could fill a number of GOOD WORDS with good precepts, of a similar kind, from Plato. But I must rest content by referring now to two other of the wisest health philosophers, both of whom belong to our own country, and both of whom have helped materially to constitute the modern English mind. These are Sir Thomas More and Lord Bacon. The Utopia of Sir Thomas More is charged with splendid precepts for the maintenance of the universal health, and Bacon is so clear in his methods of research and rules that if his designs had been carried out, the foundations of sanitary science had been safely built upon three hundred years ago. Bacon teaches

that in respect to health there are three distinct offices. 1. The preservation of health. 2. The cure of diseases. 3. The prolongation of life. He dwells on diseases that are peculiar to seasons; on epidemic diseases; and on the different inquiries that ought to be instituted touching the length and shortness of life, and the conditions under which the life of man is rendered long or short, collectively and individually.

THE POLITICAL PART.

Some circumstances of a purely political character, have helped on the study of the subject of national health. Previous to the last great revolution, which dethroned James II., and put William and Mary on the throne, there existed a tax called the hearth-tax. Every hearth in the kingdom had to be paid for. Severe as this impost seemed to be, it had one good effect indirectly; it led to the collection of correct information as to the housing and numbering of the people. Two shillings had to be paid on every hearth. How many hearths were there, and how many houses? The "hearth books" became important documents. In 1685, Dr. Davenant computed from these books that at Michaelmas of that year the number of houses in all England and Wales was one million three hundred thousand, of which five hundred and fifty-four thousand six hundred and thirty-one were houses of one hearth and chimney. The average of persons to each house was computed at five persons, and an estimate was thus made of the number of the people. The population of England and Wales then was not quite double the population of present London. The enumeration was crude, and the object of it at the time irrelevant to the subject of health; but it had this value, that it set afoot the system of national stock-taking, which has eventuated in those wonderful returns of population, house accommodation, births, marriages, deaths, and occupations, which to the modern student of health are so invaluable as bases for all the work on which he is engaged.

In late times the unnecessary risks and losses to which our men of arms have been exposed during active service, have forced on the attention of statesmen the necessity of considering the best means of preserving the health of the soldier. The experiences of the Crimean campaign; the experiences of the destruction of troops from residence in India, irrespective altogether of the vicissitudes of war; the disclosures of the great fatality from the disease pulmonary con-

sumption in men pent up in close barracks at home;—these, and many similar lessons, have led to increased attention, on the part of politicians, to the health of the communities which make up our fighting populations in time of war.

The outbreak of devastating epidemics and the occurrences of such catastrophes as gaol fever, Irish famine fever, and cholera, have demanded and at last obtained a degree of political attention which has been without parallel. Cholera, it is true, is not rendered impossible in this nation, but famine fever can hardly occur any more in the United Kingdom; while our gaols, which in the days of Howard were the foci of fever and pestilence, are now, by a strange change in events, the health spots of the land. Could any one have told Howard that within ninety years of his death the gaols,—in which he saw sacrifice of life to ignorance in the highest development that was possible to his observation,—would be the places where the tests of lowest mortality were being proved, what would have been his wonder, or his satisfaction?

Yet it is a fact, as demonstrable as any fact that was ever written, that if we could bring the mortality of the whole community to the degree of mortality that now exists in English gaols, we should reduce the death-rate almost to a natural standard, and make the common term of life a hundred years.

In yet one other direction political necessity has led to improvement in the national health. At the latter part of last century our factory system, which by that time had become of primary importance to us as a commercial country, was in as bad a sanitary form as bad could be. Men, women, and children were sacrificed ruthlessly to the greed of the trader, who spun his wares from their lives. In 1802, therefore, an act was passed for the better regulation of factories,—a first factory act, which called in the aid of medical men, and which was intended to produce, and did produce, an improvement in the health of operatives of both sexes, old and young. Since the passing of the said Act many more have followed, and although up to the present time much that requires to be done is left undone, we, as a nation, have the credit of being first in the field in endeavouring to relieve factory labour of its sickly burdens. "England," says a recent Belgian writer, "taking precedence of all other peoples on the road to industrial progress, was the first to know the evils of it, and consequently to endeavour to do away with

them." From an initiative commenced three parts of a century ago, other nations have followed in train, and a good example in political, like a good example in private life, has spread beyond its home to carry with it humane and profitable service.

THE ECONOMICAL PART.

With the political aid that has been rendered to the study of the national health there must also be taken into account economical science in its public applications to the value of money, of property, and of life. The learned Dr. Price, who a hundred years back may be said to have laid the foundation of method for computing the values of lives, and to have invented political arithmetic, very clearly traces this economical arithmetical science and its results to the origin of the national debt. The statement may strike many minds as peculiar, but it is nevertheless true. The national debt was the fruit of the last great revolution. It began with a debt of a few millions. In 1700, Price says, it was only sixteen millions; in 1715 it was fifty-five millions; from 1715 to 1740 it sank to forty-six millions; it then rose to seventy-eight millions, sank to seventy-five, and rose again, in 1775, to one hundred and forty-six; was afterwards reduced to one hundred and thirty-six millions; and, rising once more, had, in 1783, exceeded two hundred millions, "with an example of expense," adds Price, "now going on which will probably make this kingdom the wonder and terror of future ages."

I may leave the modern scholar, who knows as much about the national debt as I do, to reflect on Dr. Price's prophecy. I only refer to the matter to point out that from the calculations made upon the values of the lives of those who first invested in the national funds there sprang into fuller activity than had ever before existed, the method of estimating life by its value in the money market. The "London Annuity Society," the "Laudable Society for the benefit of Widows," the "Society for Equitable Assurances on Lives and Survivorships,"—these and other societies became great undertakings, for the conduct of which various new calculations on vitality were required, calculations that should be accurate and even refined in their accuracy. The demand for information was supplied, and with the supply there was found to be included much useful matter that related to the national health, the conditions under which health is conserved, and

the conditions under which it is impaired. In a letter to the illustrious Benjamin Franklin, whose own writings and proverbs teem with sound maxims on health, the author I have named above, Richard Price, D.D., F.R.S., dealt on expectations of lives; the increase of mankind; the number of inhabitants in London, and on the influence of great towns on health and population. In a masterly way he thus laid many bases of fact and suggestion. From his labours we may date the origin of the methods by which in this day, with vastly improved resource and learning, we calculate births against deaths, averages of mortalities in different localities, and averages of mortalities at different periods of human life.

As I have written this opening page I have

been tempted to enlarge on each point upon which I have ventured to dwell. I have been obliged from limitation of space to resist the temptation, because my object was merely to indicate to the general reader, as in a diagram on a lecture board, the lines of progressive work which have brought us in England to our present state of knowledge on national health, and to that appreciation of the subject which is beginning to manifest itself.

Let the reader remember the pre-actors in this work, and their parts; the physician or nature-man; the philosopher, in his way a nature-man also; the politician; the economist. He will then, in the after chapters of this essay, the more easily continue to move with me.

BENJAMIN W. RICHARDSON.

THE LAUREL BUSH.

An Old-fashioned Tale Story.

BY THE AUTHOR OF "JOHN HALIFAX, GENTLEMAN."

PART I.

IT was a very ugly bush indeed; that is, so far as anything in nature can be really ugly. It was lop-sided—having on the one hand a stunted stump or two, while on the other a huge heavy branch swept down to the gravel walk. It had a crooked gnarled trunk or stem, hollow enough to entice any weak-minded bird to build a nest there—only it was so near to the ground, and also to the garden gate. Besides, the owners of the garden, evidently of practical mind, had made use of it to place between a fork in its branches a sort of letter-box—not the government regulation one, for twenty years ago this had not been thought of, but a rough receptacle, where, the house being a good way off, letters might be deposited, instead of, as hitherto, in a hole in the trunk; near the foot of the tree, and under shelter of its mass of evergreen leaves.

This letter-box, made by the boys of the family at the instigation and with the assistance of their tutor, had proved so attractive to some exceedingly incautious sparrow, that during the intervals of the post she had begun a nest there, which was found by the boys. Exceedingly wild boys they were, and a great trouble to their old grandmother, with whom they were staying the summer, and their young governess

—"Misfortune," as they called her, her real name being Miss Williams—Fortune Williams. The nickname was a little too near the truth, as a keener observer than mischievous boys would have read in her quiet, sometimes sad face; and it had been stopped rather severely by the tutor of the elder boys, a young man whom the grandmother had been forced to get, to "keep them in order." He was a Mr. Robert Roy, once a student, now a teacher of the "humanities," from the neighbouring town—I beg its pardon—city; and a lovely old city it is!—of St. Andrews. Thence he was in the habit of coming to them three and often four days in the week, teaching of mornings and walking of afternoons. They had expected him this afternoon, but their grandmother had carried them off on some pleasure excursion; and being a lady of inexact habits, one, too, to whom tutors were tutors and nothing more, she had merely said to Miss Williams, as the carriage drove away, "When Mr. Roy comes, tell him he is not wanted till to-morrow."

And so Miss Williams had waited at the gate, not wishing him to have the additional trouble of walking up to the house, for she knew every minute of his time was precious. The poor and the hardworking can understand and sympathize with one

another. Only a tutor and only a governess: Mrs. Dalziel drove away and never thought of them again. They were mere machines—servants to whom she paid their wages, and so that they did sufficient service to deserve these wages, she never interfered with them, nor indeed wasted a moment's consideration upon them or their concerns.

Consequently they were in the somewhat rare and peculiar position of a young man and young woman—perhaps Mrs. Dalziel would have taken exception to the words “young lady and young gentleman”—thrown together day after day, week after week; nay, it had now become month after month; to all intents and purposes quite alone, except for the children. They taught together, there being but one school-room; walked out together, for the two younger boys refused to be separated from their elder brothers; and, in short, spent two-thirds of their existence together, without let or hindrance, comment or observation, from any mortal soul.

I do not wish to make any mystery in this story. A young woman of twenty-five, and a young man of thirty, both perfectly alone in the world—orphans, without brother or sister—having to earn their own bread, and earn it hardly, and being placed in circumstances where they had every opportunity of intimate friendship, sympathy, whatever you like to call it—who could doubt what would happen? The more so, as there was no one to suggest that it might happen; no one to watch them or warn them, or waken them with worldly-minded hints; or else to rise up, after the fashion of so many wise parents and guardians and well-intentioned friends, and indignantly shut the stable-door *after* the steed is stolen.

No. That something which was so sure to happen, had happened; you might have seen it in their eyes, have heard it in the very tone of their voices, though they still talked in a very commonplace way, and still called each other “Miss Williams” and “Mr. Roy.” In fact, their whole demeanour to one another was characterized by the grave and even formal decorum which was natural to very reserved people, just trembling on the verge of that discovery which will unlock the heart of each to the other, and annihilate reserve for ever between the two whom heaven has designed and meant to become one; a completed existence. If by any mischance this does not come about, each may lead a very creditable and not unhappy life; but it will be a locked-up life, one to which no third person is ever likely to find the key.

Whether such natures are to be envied or pitied is more than I can say; but at least they are more to be respected than the people who wear their hearts upon their sleeves for daws to peck at, and very often are all the prouder the more they are pecked at, and the more elegantly they bleed; which was not likely to be the case with either of these young folks, young as they were.

They were young, and youth is always interesting and even comely; but beyond that there was nothing remarkable about either. He was Scotch; she English, or rather Welsh. She had the clear blue Welsh eye, the funny *retroussé* Welsh nose; but with the prettiest little mouth underneath it, firm, close, and sweet; full of sensitiveness, but a sensitiveness that was controlled and guided by that best possession to either man or woman, a good strong will. No one could doubt that the young governess had, what was a very useful thing to a governess, “a will of her own;” but not a domineering or obnoxious will, which indeed is seldom will at all, but merely obstinacy.

For the rest, Miss Williams was a little woman, or gave the impression of being so, from her slight figure and delicate hands and feet. I doubt if any one would have called her pretty, until he or she had learnt to love her. For there are two distinct kinds of love, one in which the eye instructs the heart, and the other in which the heart informs and guides the eye. There have been men who, seeing an unknown beautiful face, have felt sure it implied the most beautiful soul in the world, pursued it, worshipped it, wooed and won it, found the fancy true, and loved the woman for ever. Other men there are who would simply say, “I don't know if such an one is handsome or not; I only know she is herself—and mine.” Both loves are good; nay, it is difficult to say which is best. But the latter would be the most likely to any one who became attached to Fortune Williams.

Also, perhaps, to Robert Roy, though no one expects good looks in his sex; indeed, they are mostly rather objectionable. Women do not usually care for a very handsome man; and men are prone to set him down as conceited. No one could lay either charge to Mr. Roy. He was only an honest-looking Scotchman, tall, and strong, and manly. Not “red,” in spite of his name, but dark-skinned and dark-haired; in no way resembling his great namesake, Rob Roy Macgregor, as the boys sometimes called him behind his back—never to his face. Gentle as the young man was, there was something

about him which effectually prevented any one's taking the smallest liberty with him. Though he had been a teacher of boys ever since he was seventeen—and I have heard one of the fraternity confess that it is almost impossible to be a schoolmaster for ten years without becoming a tyrant—still it was a pleasant and sweet-tempered face. Very far from a weak face, though: when Mr. Roy said a thing must be done, every one of his boys knew it *must* be done, and there was no use saying any more about it.

He had unquestionably that rare gift, the power of authority; though this did not necessarily imply self-control; for some people can rule everybody except themselves. But Robert Roy's clear, calm, rather sad eye, and a certain patient expression about the mouth, implied that he too had had enough of the hard training of life to be able to govern himself. And that is more difficult to a man than to a woman.

"All thy passions matched with mine
Are as moonlight unto sunlight, or as water unto wine."

A truth, which even Fortune's tender heart did not fully take in, deep as was her sympathy for him; for his toilsome, lonely life, lived more in shadow than in sunshine, and with every temptation to the selfishness which is so apt to follow self-dependence, and the bitterness that to a proud spirit so often makes the sting of poverty. Yet he was neither selfish nor bitter; only a little reserved, silent, and—except with children—rather grave.

She stood watching him now, for she could see him a long way off across the level Links, and noticed that he stopped more than once to look at the golf-players. He was a capital golfer himself, but had never any time to play. Between his own studies and the teaching by which he earned the money to prosecute them, every hour was filled up. So he turned his back on the pleasant pastime, which seems to have such an extraordinary fascination for those who pursue it, and came on to his daily work, with that resolute deliberate step, bent on going direct to his point and turning aside for nothing.

Fortune knew it well by this time; had learnt to distinguish it from all others in the world. There are some footsteps, which by a pardonable poetical license we say "we should hear in our graves;" and though this girl did not think of that, for death looked far off, and she was scarcely a poetical person, still, many a morning, when, sitting at her school-room window, she heard Mr. Roy coming steadily down the gravel walk, she

was conscious of—something which people cannot feel twice in a life-time.

And now, when he approached, with that kind smile of his, which brightened into double pleasure when he saw who was waiting for him, she was aware of a wild heart-beat, a sense of exceeding joy, and then of relief and rest. He was "comfortable" to her. She could express it in no other way. At sight of his face and at sound of his voice all worldly cares and troubles, of which she had a good many, seemed to fall off. To be with him was like having an arm to lean on, a light to walk by; and she had walked alone so long.

"Good afternoon, Miss Williams."

"Good afternoon, Mr. Roy."

They said no more than that, but the stupidest person in the world might have seen that they were glad to meet, glad to be together. Though neither they nor any one else could have explained the mysterious fact, the foundation of all love-stories, in books or in life—and which the present author owns, after having written many books and seen a great deal of life, is to her also as great a mystery as ever—Why do certain people like to be together? What is the inexplicable attraction which makes them seek one another, suit one another, put up with one another's weaknesses, condone one another's faults (when neither are too great to lessen love), and to the last day of life find a charm in one another's society which extends to no other human being? Happy love, or lost love—a full world, or an empty world—life with joy, or life without it—that is all the difference. Which some people think very small, and that it does not matter; and perhaps it does not; to many people. But it does to some, and I incline to put among that category Miss Williams and Mr. Roy.

They stood by the laurel bush, having just shaken hands, rather more hastily than they usually did; but the absence of the children, and the very unusual fact of their being quite alone, gave to both a certain shyness, and she had drawn her hand away, saying with a slight blush,—

"Mrs. Dalziel desired me to meet you and tell you that you might have a holiday to-day. She has taken the boys with her to Elie. I dare say you will not be sorry to gain an hour or two for yourself; though I am sorry you should have the trouble of the walk for nothing."

"For nothing?" with the least shadow of a smile; not of annoyance certainly.

"Indeed, I would have let you know if I

could, but she decided at the very last minute; and if I had proposed that a messenger should have been sent to stop you, I am afraid—it would not have answered.”

“Of course not,” and they interchanged an amused look—these fellow victims to the well-known ways of the household—which, however, neither grumbled at; it was merely an outside thing, this treatment of both as mere tutor and governess. After all (as he sometimes said, when some special rudeness, not to himself but to her, vexed him), they were tutor and governess; but they were something else beside; something which, the instant their chains were lifted off, made them feel free, and young, and strong; and comforted them with a comfort unspeakable.

“She bade me apologize. No, I am afraid, if I tell the absolute truth, she did *not* bid me, but I do apologize.”

“What for, Miss Williams?”

“For your having been brought out all this way just to go back again.”

“I do not mind it, I assure you.”

“And as for the lost lesson——”

“The boys will not mourn over it, I dare say. In fact, their term with me is so soon coming to an end, that it does not signify much. They told me they are going back to England, to school, next week. Do you go back too?”

“Not just yet, not till next Christmas. Mrs. Dalziel talks of wintering in London, but she is so vague in her plans that I am never sure from one week to another what she will do.”

“And what are your plans? *You* always know what you intend to do?”

“Yes, I think so,” answered Miss Williams, smiling. “One of the few things I remember of my mother, was hearing her say of me, that ‘her little girl was a little girl who always knew her own mind.’ I think I do. I may not be always able to carry it out, but I think I know it.”

“Of course,” said Mr. Roy absently and somewhat vaguely, as he stood beside the laurel bush, pulling one of its shiny leaves to pieces, and looking right ahead, across the sunshiny Links, the long shore of yellow sands, where the mermaids might well delight to come and “take hands,”—to the smooth, dazzling, far-away sea. No sea is more beautiful than that at St. Andrews.

Its sleepy glitter seemed to have lulled Robert Roy into a sudden meditation, from which no word of his companion came to rouse him. In truth, she, never given much to talking, simply stood, as she often did,

silently beside him; quite satisfied with the mere comfort of his presence.

I am afraid this Fortune Williams will be considered a very weak-minded young woman. She was not a bit of a coquette, she had not the slightest wish to flirt with any man. Nor was she a proud beauty desirous to subjugate the other sex, and drag them triumphantly at her chariot-wheels. She did not see the credit, or the use, or the pleasure, of any such proceeding. She was a self-contained, self-dependent woman. Thoroughly a woman; not indifferent at all to womanhood's best blessing; still, she could live without it if necessary, as she could have lived without anything which it had pleased God to deny her. She was not a creature likely to die for love, or do wrong for love, which some people think the only test of love's strength, instead of being its utmost weakness; but that she was capable of love, for all her composure and quietness, capable of it, and ready for it, in its intensest, most passionate, and most enduring form, the God who made her knew, if no one else did.

Her time would come; indeed, had come already. She had too much self-respect to let him guess it, but I am afraid she was very fond of—or, if that is a foolish phrase, deeply attached to, Robert Roy. He had been so good to her, at once strong and tender, chivalrous, respectful, and kind; and she had no father, no brother, no other man at all to judge him by, except the accidental men whom she had met in society, creatures on two legs who wore coats and trousers, who had been civil to her, as she to them, but who had never interested her in the smallest degree, perhaps because she knew so little of them. But no, it would have been just the same had she known them a thousand years. She was not “a man's woman,” that is, one of those women who feel interested in anything in the shape of a man, and make men interested in them accordingly, for the root of much masculine affection is pure vanity. That celebrated Scotch song,—

“Come deaf, or come blind, or come cripple,
O come, any ane o' them a'
Far better be married to something,
Than no to be married ava,”

was a rhyme that would never have touched the stony heart of Fortune Williams. And yet, let me own it once more, she was very fond of Robert Roy. He had never spoken to her one word of love, actual love, no more than he spoke now, as they stood

side by side, looking with the same eyes upon the same scene. I say the same eyes, for they were exceedingly alike in their tastes. There was no need ever to go into long explanations about this or that; a glance sufficed, or a word, to show each what the other enjoyed; and both had the quiet conviction that they were enjoying it together. Now as that sweet, still, sunshiny view met their mutual gaze, they fell into no poetical raptures, but just stood and looked, taking it all in with exceeding pleasure, as they had done many and many a time, but never, it seemed, so perfectly as now.

"What a lovely afternoon!" she said at last.

"Yes. It is a pity to waste it. Have you anything special to do? What did you mean to employ yourself with, now your birds are flown?"

"Oh, I can always find something to do."

"But need you find it? We both work so hard. If we could only now and then have a little bit of pleasure!"

He put it so simply, yet almost with a sigh. This poor girl's heart responded to it suddenly, wildly. She was only twenty-five, yet sometimes she felt quite old, or rather as if she had never been young. The constant teaching, teaching of rough boys too—for she had had the whole four till Mr. Roy took the two elder off her hands—the necessity of grinding hard out of school hours, to keep herself up in Latin, Euclid, and other branches which do not usually form part of a feminine education, only having a great natural love of work, she had taught herself—all these things combined to make her life a dull life, a hard life, till Robert Roy came into it. And sometimes even now, the desperate craving to enjoy—not only to endure, but to enjoy—to take a little of the natural pleasures of her age—came to the poor governess very sorely, especially on days such as this, when all the outward world looked so gay, so idle, and she worked so hard.

So did Robert Roy. Life was not easier to him than to herself; she knew that; and when he said, half joking, as if he wanted to feel his way, "Let us imitate our boys, and take a half holiday," she only laughed, but did not refuse.

How could she refuse? There were the long smooth sands on either side the Eden, stretching away into indefinite distance, with not a human being upon them to break their loneliness, or if there was, he or she looked mere dots, not human at all. Even if these

two had been afraid of being seen walking together—which they hardly were, being too unimportant for any one to care whether they were friends or lovers, or what not—there was nobody to see them, except in the character of two black dots on the yellow sands.

"It is low water; suppose we go and look for sea anemones. One of my pupils wants some, and I promised to try and find one the first spare hour I had."

"But we shall not find anemones on the sands."

"Shells, then, you practical woman! We'll gather shells. It will be all the same to that poor invalid boy—and to me," added he, with that involuntary sigh which she had noticed more than once, and which had begun to strike on her ears not quite painfully. Sighs, when we are young, mean differently to what they do in after years. "I don't care very much where I go, or what I do; I only want—well, to be happy for an hour, if Providence will let me."

"Why should not Providence let you?" said Fortune gently. "Few people deserve it more."

"You are kind to think so, but you are always kind to everybody."

By this time they had left their position by the laurel bush, and were walking along side by side, according as he had suggested. This silent, instinctive acquiescence in what he wished done—it had happened once or twice before, startling her a little at herself; for, as I have said, Miss Williams was not at all the kind of person to do everything that everybody asked her, without considering whether it was right or wrong. She could obey, but it would depend entirely upon whom she had to obey; which, indeed, makes the sole difference between loving disciples and slavish fools.

It was a lovely day, one of those serene autumn days peculiar to Scotland—I was going to say to St. Andrews; and any one who knows the ancient city will know exactly how it looks in the still, strongly-spiritualised light of such an afternoon, with the ruins, the castle, cathedral, and St. Regulus's tower standing out sharply against the intensely blue sky, and on the other side—on both sides—the yellow sweep of sand curving away into distance, and melting into the sunshiny sea.

Many a time, in their prescribed walks with their young tribe, Miss Williams and Mr. Roy had taken this stroll across the Links and round by the sands to the mouth

of the Eden, leaving behind them a long and sinuous track of many footsteps, little and large; but now there were only two lines—"footprints on the sands of Time," as he jestingly called them, turning round and pointing to the marks of the dainty feet that walked so steadily and straightly beside his own.

"They seem made to go together, those two tracks," said he.

Why did he say it? Was he the kind of man to talk thus without meaning it? If so, alas! she was not exactly the woman to be thus talked to. Nothing fell on her lightly. Perhaps it was her misfortune, perhaps even her fault, but so it was.

Robert Roy did not "make love;" not at all. Possibly he never could have done it, in the ordinary way. Sweet things, polite things, were very difficult to him, either to do or to say. Even the tenderness that was in him came out as if by accident; but oh how infinitely tender he could be! Enough to make any one who loved him die easily, quietly, contentedly, if only just holding his hand.

There is an incident in Dickens's touching "Tale of Two Cities," where a young man going innocent to the guillotine, and riding on the death-cart with a young girl whom he had never before seen, is able to sustain and comfort her, even to the last awful moment, by the look of his face and the clasp of his hand. That man, I have often thought, must have been something not unlike Robert Roy.

Such men are rare, but they do exist; and it was Fortune's lot, or she believed it was, to have found one. That was enough. She went along the shining sands in a dream of perfect content, perfect happiness, thinking—and was it strange or wrong that she should so think?—that if it were God's will she should thus walk through life, the thorniest path would seem smooth, the hardest road easy. She had no fear of life, if lived beside him; or of death—love is stronger than death; at least this sort of love, of which only strong natures are capable, and out of which are made, not the lyrics perhaps, but the epics, the psalms, or the tragedies of our mortal existence.

I have explained thus much about these two friends—lovers that may be, or might have been—because they never would have done it themselves. Neither was given to much speaking. Indeed I fear their conversation this day, if recorded, would have been of the most feeble kind—brief, frag-

mentary, mere comments on the things about them, or abstract remarks not particularly clever or brilliant. They were neither of them what you would call brilliant people; yet they were happy, and the hours flew by like a few minutes, until they found themselves back again beside the laurel bush at the gate, when Mr. Roy suddenly said,—

"Do not go in yet. I mean, need you go in? It is scarcely past sunset; the boys will not be home for an hour; they don't want you, and I—I want you so. In your English sense," he added with a laugh, referring to one of their many arguments, scholastic or otherwise, wherein she had insisted that to want meant, *Anglicè*, to wish, or to crave, whereas in Scotland it was always used like the French *manquer*, to miss, or to need.

"Shall we begin that fight over again?" asked she smiling; for everything, even fighting, seemed pleasant to-day.

"No, I have no wish to fight; I want to consult you, seriously, on a purely personal matter, if you would not mind taking that trouble."

Fortune looked sorry. That was one of the bad things in him (the best men alive have their bad things), the pride which apes humility, the self-distrust which often wounds another so keenly. Her answer was given with a grave and simple sincerity that ought to have been reproach enough.

"Mr. Roy, I would not mind any amount of trouble if I could be of use to you; you know that."

"Forgive me! Yes, I do know it. I believe in you and your goodness to the very bottom of my heart."

She tried to say "Thank you," but her lips refused to utter a word. It was so difficult to go on talking like ordinary friends, when she knew, and he must know she knew, that one word more would make them—not friends at all—something infinitely better, closer, dearer; but that word was his to speak, not hers. There are women who will "help a man on"—propose to him, marry him indeed—while he is under the pleasing delusion that he does it all himself; but Fortune Williams was not one of these. She remained silent and passive, waiting for the next thing he should say. It came: something the shock of which she never forgot as long as she lived; and he said it with his eyes on her face, so that if it killed her she must keep quiet and composed, as she did.

"You know the boys' lessons end next

week. The week after I go—that is, I have almost decided to go, to India.”

“To India!”

“Yes. For which no doubt you think me very changeable, having said so often that I meant to keep to a scholar’s life, and be a professor one day perhaps, if by any means I could get salt to my porridge. Well, now I am not satisfied with salt to my porridge; I wish to get rich.”

She did not say “Why?” She thought she had not looked it; but he answered, “Never mind why. I do wish it, and I will be rich yet, if I can. Are you very much surprised?”

Surprised she certainly was, but she answered honestly, “Indeed you are the last person I should suspect of being worldly-minded.”

“Thank you; that is kind. No, just; merely just. One ought to have faith in people; it does one good. I am afraid my own deficiency is want of faith. It takes so much to make me believe for a moment that any one cares for me.”

How hard it was to be silent—harder still to speak! But she did speak.

“I can understand that; I have often felt the same. It is the natural consequence of a very lonely life. If you and I had had fathers and mothers and brothers and sisters, we might have been different.”

“Perhaps so. But about India. For a long time—that is, for many weeks—I have been casting about in my mind how to change my way of life—to look out for something that would help me to earn money, and quickly; but there seemed no chance whatever. Until suddenly, one has opened.”

And then he explained how the father of one of his pupils, grateful for certain benefits, which Mr. Roy did not specify, and noticing certain business qualities in him—“which I suppose I have, though I didn’t know it,” added he with a smile—had offered him a situation in a merchant’s office at Calcutta: a position of great trust and responsibility, for three years certain, with the option of then giving it up or continuing it.

“And continuing means making a fortune. Even three years means making something, with my ‘stingy’ habits. Only I must go at once. Nor is there any time left me for my decision; it must be yes or no. Which shall it be?”

The sudden appeal—made, too, as if he thought it was nothing—that terrible yes or no, which to her made all the difference of

living or only half living, of feeling the sun in or out of the world. What could she answer? Trembling violently, she yet answered in a steady voice. “You must decide for yourself. A woman cannot understand a man.”

“Nor a man a woman, thoroughly. There is only one thing which helps both to comprehend one another.”

One thing! she knew what it was. Surely so did he. But that strange distrustfulness of which he had spoken, or the hesitation which the strongest and bravest men have at times, came between.

“Oh, the little more, and how much it is!
Oh, the little less, and what worlds away!”

If, instead of looking vaguely out upon the sea, he had looked into this poor girl’s face; if, instead of keeping silence, he had only spoken one word! But he neither looked nor spoke, and the moment passed by. And there are moments which people would sometimes give a whole lifetime to recall, and use differently; but in vain.

“My engagement is only for three years,” he resumed; “and then, if alive, I mean to come back. Dead or alive, I was going to say, but you would not care to see my ghost, I presume? I beg your pardon, I ought not to make a joke of such serious things.”

“No, you ought not.”

She felt herself almost speechless, that in another minute she might burst into sobs. He saw it—at least he saw a very little of it, and misinterpreted the rest.

“I have tired you. Take my arm. You will soon be at home now.” Then, after a pause, “You will not be displeased at anything I have said? We part friends? No, we do not part; I shall see you every day for a week, and be able to tell you all particulars of my journey, if you care to hear.”

“Thank you, yes—I do care.”

They stood together, arm-in-arm. The dews were falling; a sweet, soft, lilac haze had begun to creep over the sea—the solemn far-away sea, that he was so soon to cross. Involuntarily, she clung to his arm. So near, yet so apart! Why must it be? She could have borne his going away, if it was for his good, if he wished it; and something whispered to her that this sudden desire to get rich was not for himself alone. But oh, if he would only speak! One word—one little word! After that, anything might come—the separation of life, the bitterness of death. To the two hearts that had once opened

each to each, in the full recognition of mutual love, there could never more be any real parting.

But that one word he did not say. He only took the little hand that lay on his arm, pressed it, and held it—years after, the feeling of that clasp was as fresh on her fingers as yesterday—then, hearing the foot of some accidental passer-by, he let it go, and did not take it again.

Just at this moment, the sound of distant carriage-wheels was heard.

"That must be Mrs. Dalziel and the boys."

"Then I had better go. Good-bye."

The day-dream was over. It had all come back again—the forlorn, dreary, hard-working world.

"Good-bye, Mr. Roy." And they shook hands.

"One word," he said hastily: "I shall write to you—you will allow me?—and I shall see you several times, a good many times, before I go?"

"I hope so."

"Then, for the present, good-bye. That

means," he added earnestly, "'God be with you!' And I know He always will."

In another minute Fortune found herself standing beside the laurel bush, alone, listening to the sound of Mr. Roy's footsteps down the road—listening, listening, as if, with the exceeding tension, her brain would burst.

The carriage came, passed; it was not Mrs. Dalziel's, after all. She thought he might discover this, and come back again; so she waited a little—five minutes, ten—beside the laurel bush. But he did not come. No footstep, no voice; nothing but the faint, far-away sound of the long waves washing in upon the sands.

It was not the brain that felt like to burst now, but the heart. She clasped her hands above her head. It did not matter; there was no creature to see or hear that appeal—was it to man, or God?—that wild, broken sob, so contrary to her usual self-controlled and self-contained nature. And then she leaned her forehead against the gate, just where Robert Roy had accidentally laid his hand in opening it, and wept bitterly.

CHURCH MUSIC.

SOFT, through the rich illumined panes,
All down the aisle the sunlight rains,
And sets in red and purple stains.

And mid this glory from the skies,
We hear the organ-voice arise.
Its wings the waking spirit tries:

It flutters, but it cannot soar.
Oh! heavenly music, let us pour
Our woes, our joys, in thee once more.

All wilt thou take. Thou mak'st no choice.
Hearts that complain, hearts that rejoice,
Find thee their all-revealing voice.

All, all the soul's unuttered things
Thou bearest on thy mighty wings
Up, up until the arched roof rings:

Now soft—as when, for Israel's King,
Young David swept his sweet harp-string;
Now loud—as angels antheming.

Oh! tell what myriad heads are bent.
Oh! tell what myriad hearts repent.
HE will look down: HE will relent.

It dies. The last low strain departs.
With deep "Amen" the warm tear starts.
The peace of Eden fills our hearts.

KATHERINE SAUNDERS.

A DAY WITH THE GERMAN-AUSTRIAN ALPINE CLUB.

AT half-past ten on the morning of the 5th of September, I was enjoying the delicious sleep which rewards the labours of a long Alpine day, with visions of impossible ice-slopes, continuous hewing of steps, and descents over loose and crumbling rocks amid showers of falling stones, floating in happy vagueness before my mind, when I became dimly conscious at intervals of a loud and continuous knocking, kept up uninterruptedly in the close vicinity of my head. Now, when a man travelling in the Alps hears a knocking in his sleep, the first idea which naturally occurs to him is, that he is being wakened at some unnaturally early hour of the night or morning to start upon an excursion; and there rises up before his consciousness the whole usual train of incidents which so painfully cloud the opening of even the most successful day: he has been called an hour too late, and the rest of the party are railing at him, or have possibly started without him; the weather looks grey and overcast, or if fine the wind is in the wrong quarter; the *portier* has omitted to grease his boots; the descent in the dark to the *salle à manger*, down long passages and over innumerable sets of high heels and heavy hobnails, is the most dangerous of the day, and scarcely accomplished when he finds he has forgotten two or three essential articles, and must return to fetch them; the breakfast, ordered with so much care and precision from the *Fräulein* herself the night before, is represented by nothing but a long table and an array of empty coffee cups; and the *Kellner*, with difficulty extracted from his bed, learns with unfeigned surprise that you want anything to eat at so unseasonable an hour. Then a whole series of difficulties will arise about the provisions, or *Proviand*, as they are usually termed, the ordering of which, after much discussion, was entrusted yesterday to one of the party, "an old hand;" the guides inform you that four more bottles of wine are absolutely necessary, that no spirits have been provided, and that the dirty-looking plug of matter which stands for meat, and which you know, when it comes to the point, you will be unable to masticate, is very small to be divided among so large a party. When all is packed and ready, Jones suggests that the butter has been forgotten, and it is discovered that Brown, who was so strong on the neces-

sity of an early start, has never put in an appearance, and is probably still fast asleep. Finally, when, all difficulties surmounted, you have started some hour and a half late, and trudged some distance on your way, you discover from a long-continued jabber of mutual recrimination among the guides that the knapsack containing all or the greater part of the provisions has been left behind altogether.

Such being some of the *contretemps* which invariably beset the start upon a snow excursion in the Alps, it is not to be wondered at that the experienced traveller should catch the first sounds of such a supposed *réveillé* with at least qualified pleasure, and experience a sweet sense of relief as the sun, high up in the heavens, and a dim recollection of the labours of yesterday, assure him that he cannot be bound upon an excursion which demands an early start to-day; and this delightful sense of reprieve I began to experience as I slowly opened my eyes and looked out from a narrow German bed, half covered with still narrower sheets, within which I had been in vain endeavouring to confine my person throughout the night, upon the bare floor and gaily-coloured ceiling of my simple upper room at the Sulden inn, into which the glorious morning sun was streaming through the open casement like a sea of gold. No; I was evidently not being called for an early start; but what was that knocking all about? Finding further sleep impossible, I jumped up, and poking my head out of the window, discovered that the whole front of the house was being decorated in the most jaunty manner with flags, flowers, leaves, and mottoes, and all the paraphernalia of a German *Feiertag*; the host, his daughters, and even guests, were one and all lending a hand, and from the general feeling of stir and bustle in the air, it was evident that the day was to be a day of no common order. Seeing further signs of decoration in the direction of the simple white mountain chapel on the further side of the valley, I concluded naturally that it was some church festival or saint's day, and racked my brains without success, while I was dressing, to divine what incident in the biography of the Virgin might be fitly celebrated on the 5th of September.

Descending leisurely to my breakfast, which a long experience of the inns in the German Alps had led me to order the first moment I was out of bed, I found excitement everywhere. The miscellaneous horde

of women who are always bustling about a Tyrolese kitchen, and whose united efforts can on a pinch supply the weary mountaineer with a basin of watery soup, and a dubious dish of dark-coloured thrice-cooked *Braten* in about an hour and a half, were bustling about more actively than ever; and the look of mingled pity and contempt with which the *Wirth* received my simple query, "Was there anything particular going on there to-day?" warned me that my character must suffer by any display of ignorance on the subject. A fussy little gentleman, in a Tyrolese hunting-coat and spectacles, was spasmodically running in great excitement up and down the stairs between the *Gaststube* and a balcony above; and while mine host, with an indignant "Anything going on? Look there!" directed my attention to a huge placard posted on the wall, the fussy little gentleman gave me to understand, with much gesticulation and an air of mystery, that in a short time certain preparations of his would be completed, and that if I would swallow my coffee with all speed, he would then be able to enlighten me about the whole affair. So, on a given signal up I went to the balcony: here nothing was to be seen but a small telescope, fastened by a screw in an almost vertical position to the ladder which was being used for hanging up the decorations. I applied my eye to the sight, and at last, after repeated inquiries from my friend, "Don't you see it now? Don't you see the flag waving to the left of it?" descried the object of all this hubbub. There, at a height of some four to five thousand feet above us, almost directly over our heads as it seemed, nestled in a sly corner on the edge of a precipitous cliff, far above the last straggling pine, and close to the line of perpetual snow, peeped out a slope of white woodwork like the sarking of a roof, and underneath it a tiny bit of undeniable masonry, looking like a doll's house in the distance, window and all complete. "That's it! that's the *Payer-hütte*! more than half-way up the Ortler, and it's to be inaugurated to-morrow! Here are all the particulars," he continued, and, turning once more to the placard below, I read an announcement with the following heading, printed in huge capitals:—

"Einladung zur feierlichen Einweihung u. Eröffnung der 'Payerhütte' auf dem Tabaretakamm (9700')!"

My German friend then further explained to me that the hut had been erected by the exertions of the Prag section of the German-

Austrian Alpine Club, that it was to be called the Payer-hütte in honour of Lieutenant Julius Payer, of the Austrian service, who had done so much for the exploration of the Ortler district by his expeditions, his maps, and communications to their Alpine journals; that Lieutenant Payer himself was to be there, with the President of the Prag section, and that invitations had been issued to every part of Austria and Germany, to Italy, France, and every mountaineering country (he did not mention England), begging the presence of all interested in Alpine exploration, on the occasion of the inauguration of the highest habitable dwelling on German soil, within three hours of the summit of the monarch of German mountains. What might be the effect of a promiscuous acceptance of this comprehensive invitation on the very limited resources of the inns at Suldén and Trafoi, the only inns within reach of the sphere of operations (to say nothing of the hut itself), I forbore to inquire; but I was assured alike by our host and by my friend, who proved to be the secretary of the Munich section of the club, that there would be "eine furchtbare Menge Menschen" trooping into the two valleys that day; that the roads over the Stelvio, up the Adige and over the Finstermünz would be crowded with the gathering mountaineers, and that the idea of getting beds at Trafoi for myself and the three friends who were coming over the Stelvio that day, was altogether out of the question. Moved by these representations, I thought it best before advancing further to secure my communications in the rear; and leaving behind just as many of my least necessary articles as I thought would establish a lien upon my room at Suldén in case of need, I threw the remainder into my *Rück-sack* and set off for Trafoi, determined to make the most of my chances at both inns for myself and friends.

Before starting, I had sounded the Munich secretary as to whether there was any chance of my being permitted to join the expedition, as the proceedings seemed likely to be amusing and characteristic, and I should have an opportunity, under favourable circumstances, of comparing the mountaineering qualities and ways of German mountaineers, with those of my various friends of the English Alpine Club. He had assured me that as the invitation had been so general, he had no doubt I should be welcome, and as there were sure to be, as it was, far more people at the gathering than the hut could possibly

accommodate, there could be no difficulty in finding at least as good accommodation for one or two more. I should find the President himself at Trafoi, and should apply to him.

I had long desired to ascend the Ortler Spitze. I had been captivated by the beauty of the peak just ten years ago, when on reaching the summit of the Stelvio Pass from the Bormio side, I first caught sight of its lovely outline—the culminating point of the noblest view to be seen from any high-road in the Alps. Beyond all question, the Stelvio is the finest of all the great alpine carriage passes. In height, in audacity, in the difficulties it has to overcome, as well as in the grandeur and variety of the scenery through which it passes, and, above all, the surprises which it affords, the Stelvio road stands unrivalled. For six hours the traveller has been mounting from the Italian side through rock scenery of the sternest kind, the magnificently engineered road holding the even tenour of its way by endless zigzags up the steepest and loosest of shingle slopes, burrowing through precipices, protecting itself by frequent pent-houses against avalanches of snow or stones, and flying torrents without number; no vegetation in view for hours, scarce even a glimpse of snow high up upon the southern heights. In a moment, without warning, the traveller finds himself above the limit of perpetual snow, at a height of 9,213 feet above the sea, one glacier at his side almost reaching to the road; in front, the ground descends so rapidly that it seems cut away altogether; right opposite is the magnificent Madatsh glacier, plunging down thousands of feet into the deep pine-clothed cleft of the Trafoi valley; above, a complete semicircle of snowy peaks tossing up their heads like vast wave-crests in every variety of pyramidal form, while supreme above them all in an overpowering mass rises the stainless white of the Ortler, undisputed monarch of the entire group. On no other pass does a road lead so completely into the heart of the untrodden snows: in no other group is the highest peak to be found so near to its outer edge.

It is impossible to have the glory of this view stretched before one without longing to make the ascent of the Ortler; and on the occasion of my crossing the pass in 1865, my desires had been fired by hearing of the new route to the top which had been struck out the year before by those famous *Bergsteiger* of our Alpine Club, Messrs. Tuckett and Buxton. On the present occasion, my

friends found the whole pass from the Austrian frontier onwards alive with expectancy; nothing was talked about at the inns on the way but the approaching *Fest*; bunting and green-stuff were being mounted everywhere, the road was dotted with pedestrians, trudging along in every variety of garb and gaiter, the accoutrements of no two of them agreeing in any single particular except (to an English eye) their absolute unadaptability to their purpose; and the expectation of my friends that they would find beds anywhere in the two valleys that night was universally and unanimously pronounced absurd. Meanwhile I had pushed on down the Suldenthal, more than once stopped on my way by a friendly remonstrance from a native at my leaving the valley on such a day: "Sie gehen nicht heute fort? Heute ist ein grosse Feiertag!" and gaining the Stelvio road at the Austrian fort of Gomagoi, reached Trafoi just in time to anticipate the diligence and the *avant-garde* of the straggling column of pedestrians. If Sulden was alive with expectation, Trafoi was in a state of roaring revelry. Triumphal arches bearing triumphant mottoes spanned the road; flags waved from every window, the whole of the eighty inhabitants of the place were collected in knots before the inn; a brass band as motley as multitudinous, composed partly of very fat men and partly of very small boys, was in vain attempting to get into tune in the intervals between frequent draughts of red Tyrolean wine which were incessantly being brought out to them by the young ladies of the inn; while the less-favoured many packed the ground-floor rooms of the house in a dense mass of shirt-sleeves, knee-breeches, and embroidered braces, smoking, drinking, card-playing, and bursting into snatches of wild chorus, which would rise every now and then into the dignity of a prolonged and unanimous jödel.

Beds promptly secured, my next thought was to seek out the Herr Präsident of the Prag section, whose name was in everybody's mouth, and who was the hero of the hour, as the supreme *arbitrer bibendi*, and commander-in-chief of the expedition. I sent up my card, and on his entering the *Speise-saal*, a few moments afterwards, preferred my request for myself and friend. He received me in the most gracious manner, and drawing himself up in the first position, commenced a series of forward movements with the upper portions of his body, and, laying his left hand on his heart, executed a corresponding series of horizontal movements

with his right, hat and all; assuring me in the most rounded periods, "that it would give himself the greatest pleasure, and the whole company the greatest joy, if we would give them the honour of our company on this most interesting occasion—the festal inauguration of the highest refuge for travellers, at an elevation of nearly ten thousand feet above the sea, to assist in the ascent of the highest mountain of the Alps: I mean," he continued, as he noticed a slight look of incredulity on my face, "the highest upon German soil." I mumbled out, English-fashion, my thanks. "Would I not be thought to be taking a liberty in joining the party uninvited?" "Uninvited!" exclaimed the Herr Präsident with energy. "No one is uninvited! The whole world has been invited! ('Die ganze Welt ist eingeladen!') The one thing needed to crown the success of our assemblage of all nations at the inauguration of the Payer-hütte would be that some representatives of the English people should do us the high honour of being present at the ceremony," &c., &c.

The peroration of this speech, which took some minutes in delivery, was abruptly cut short by a deafening explosion. The leaders of the diligence had just been espied turning the corner of the last zigzag down the pass, and the discharge of the first great salvo of the local artillery had been reserved for its triumphal entry into the village, bearing, as was expected, some portion of the world-gathering to the scene of action. The firing of the eight maroons which were to constitute this *feu de joie*, and which had been carefully masked in battery upon the edge of the road, was judiciously reserved till the horses were within thirty yards of the spot; partly, no doubt, to render the surprise more complete; partly with a view to quieting the nerves of the two old ladies in the interior, who had been in one spasm of terror (small blame to them) the whole way down the zigzags, and who would now feel with Agag that life had no more terrors left for them. Off thundered the maroons, just in time; the horses, who looked as if they had no spare energies to be daunted by imaginary fears, charged into a sea of smoke; the last of the maroons leapt back in recoil across the road just in time to avoid the nose of the first leader; such portion of the band as had completed their last round of liquor, struck up the Austrian National Hymn, and for the next quarter of an hour the general enthusiasm, for that day, reached its height. Introductions, greetings (kisses not

excepted), and bowings without number, were exchanged between the new arrivals and those waiting to receive them; and before long the Herr Präsident set off at the head of the greater portion of his followers, amid a second discharge of artillery, and fresh triumphal music from the band, to march to Suldén, from which place the greater number of the party were to make the ascent to the hut next day. The signs of festivity, nevertheless, were kept up at Trafoi during the entire afternoon and night with unabated vigour; explosions from one, two, or more of the maroons were perpetually taking place without the smallest provocation, and at the most unexpected moments; the band kept fitfully bursting out into waltzes, polkas, and triumphal marches, and the general hubbub of drinking, playing, dancing, and singing within the inn never flagged, though I am bound to state, so far as I could see, it did not culminate in a single case of drunkenness; thanks, partly to the extremely non-alcoholic character of the Tyrolean wine, partly to that nicely-regulated slowness of imbibition by which the German preserves himself from excess, taking care never to keep on board, at one time, enough liquor to make him drunk. In drinking, as in other things, it is the pace that kills.

The programme for the next day, as I had ascertained from the Präsident, was to be as follows:—two parties were to ascend to the hut, one from Suldén, and one from Trafoi. The Suldén party were to start at eleven o'clock, the Trafoi party, having an hour's more ascent before them, at ten, so that both parties might arrive together. At four P.M. the solemn inauguration of the hut was to take place, after which, those who had no appetite for the Ortler Spitze were to descend, the remainder were to pass the night at the hut, and ascend the mountain on the following morning, and on the descent of this last party to Trafoi the same evening, the festivities were to reach their climax. The success of the whole thing would depend upon the weather; many and anxious were the looks cast up to the sky, over which clouds were beginning to gather, and, as is invariably the case on such occasions, neither wind nor glass could be pronounced entirely satisfactory.

The morning, however, belied the expectation of the prophets of evil; the sky was brilliant, if not cloudless, and as sleep was rendered impossible from an early hour by a continual discharge of the maroons, we were down in good time, and had all our preparations complete for the start at ten.

To our surprise, however, we found the house stripped of all the mountaineers of the night before; the wary Germans, some of whom were not of the age, and few of whom were of the proportions, best suited to rapid climbing, had crept off in detachments at an early hour, so as to have the whole morning for the ascent; so that when we started with our porter, and a couple of unattached amateurs, at the prescribed hour of ten, we found ourselves the last of the party, and enjoyed all the honours of the official *feu de joie* to ourselves.

Our path led us for half-a-mile in the direction of the beautiful spot at the Heiligen Drei Brunnen, above Trafoi. We then crossed the stream, and for an hour and a half ascended the very steep slope which faces the lower reaches of the Stelvio Road. The path had evidently been newly made for the occasion, and for the strangers' benefit was marked at every turn by a broad streak of red paint on tree, rock, or ground. Straight up it led us, under a burning sun, through thick pines and arolla bushes, up some awkward water-courses and narrow ledges, till it landed us, about half-way to our destination, on a dreary plateau of stone *débris*, from which we had a magnificent view of the Stelvio Road, winding up its apparently impossible slopes, full in front of us. We could here fully appreciate the marvellous audacity of the project to carry a road over such a barrier; it cannot be called a pass, in the ordinary sense of the word. The road does not, as in most other passes, ascend a long valley to its head, and then pass imperceptibly over a watershed; from the very outset, at Trafoi, it takes to the wild mountain side, and climbs straight up, across slopes of the most formidable steepness and looseness, to the very summit of the range. There is scarcely a visible depression at the top for the road to traverse; and in fact, as we all agreed, it should be classed as a peak rather than as a pass.

Pushing onwards, a few minutes more brought us within sight of the hut right above us, and we could just distinguish a number of figures clustered like bees upon a rock in front of it. The flag of the German-Austrian Alpine Club, with its vertical stripes of red and white, could be seen waving from the top; while, to our great amusement, in curious incongruity with all the elements of the scene, there was wafted down to us a confused jumble of sound from our old friends of the brass band. A hot, thirsty climb of near two hours more up a waste of loose stones, without a vestige of shade or a

drop of water, brought us to the edge of the rocky ridge which divides the Suldén valley from that of Trafoi. A few minutes more up the ridge, and we found ourselves in the midst of a crowd of nearly one hundred persons peeping down into the mouth of the hut, which was so buried between protecting rocks on either side as to look rather like a cave than a human habitation.

The hut we found substantially built of solid masonry, with a coating of cement; a window with stout double-glass panes at either end, the one eye peering down to Suldén, the other to Trafoi; in the centre a tablet with an inscription stating that the Payer-hütte had been built by the Prag section of the Alpine Club, 1875; while over the door were printed, large letters, the following verses:—

“Willkommen! Herz und Hand zum Grusz
Auf: teiler Tabaretta Wand
An Höcster Warte stolzem Fusz
Im schönen Deutschen Alpenland!
Hier stählt der Payer-hütte Hört
Zur Ortel-fahrt die Glieder;
Mit trunknem Auge schaut Ihr dort
Auf's Land Tiröl hernieder!”

We were conducted most courteously by the President into the hut, which was packed as full as it could hold, and a large dish of excellent hot broth, with a tumbler full of wine, was placed before each of us. Building and fittings appeared to be of the most perfect character; the building only too well finished, as, except through the door, no particle of air could find its way into the room. Its size might be some twenty to twenty-four feet by fifteen. On the left, the entire length was taken up by a long sleeping shelf, covered with small mattresses, coverlets, and pillows, containing in all ten complete berths side by side. At the head of each was a square hole lined with wood, in the thickness of the wall, in which the occupants might place their valuables, and each containing a pair of nice straw slippers. At the far end stood a roomy stove, with several large pots comfortably hissing upon it; in the centre of the right hand wall was a deep cupboard, containing a complete set of cooking utensils, crockery, glass, cutlery, silver, &c., all of the neatest and most substantial kind; large crocks labelled *Zucker, Salz, Café, Wasser*, &c., with every small article which could by any possibility be required by future occupants. Even a rope and ice-axe had not been forgotten among the properties of the hut; the side-walls bristled with pegs; substantial chairs, tables, and benches occupied the available space on the floor. Nothing could be more perfect and inviting than the whole appearance of the room and fittings.

Every type of German, every profession, seemed to be represented in the group around us; but, with the exception of two Italians and ourselves, none but Germans had responded to the President's liberal invitation to "die ganze Welt." Before long, the whole party was summoned out to be photographed, and nearly an hour was spent in vain efforts to dot about in natural groups, upon the narrow ridge of rock, the eighty-six persons present. No sooner was one little knot posed to perfection, than it was discovered that it totally eclipsed another knot behind; and when all seemed ready, it was found that about one-half of the people would be out of the picture altogether. At length we were all squeezed into a dense mass, with heads at least protruding in the line of fire; and as no one but my friend and self saw a tinge of comic in the posing of such a medley group on such a spot, the whole party sat on with an unbroken gravity which must have rejoiced the photographer's heart, and the photograph was pronounced a complete success.

This over, the real business of the day commenced. The Herr Präsident mounted upon a plank, and summoning all around him, delivered the inauguration speech. He began by giving a complete history of the undertaking; how, years ago, a committee from various sections of the club had been appointed, and had done nothing (it was most satisfactory to an English ear to hear that even in Germany a committee might be appointed, and nothing come of it); how many meetings had been held, and in how many different places; how at length the section Prag had taken the matter up, collected subscriptions from the other sections, and itself undertaken to carry out and complete the work. He described the various difficulties which had to be contended with in its execution; and in justification of the name of the hut, passed a glowing eulogium on the services rendered in the exploration of the district by Lieutenant Payer, who had expected himself to be present on the occasion. He then described in earnest and impassioned language the glory of having erected at such a height and in such a region, an asylum from the storm, a refuge for the weary, an assistance to the weak, in reaching through the perils of eternal snow the highest summit of the Vaterland; and in the most solemn manner formally handed over the hut, its equipment and its keeping, to the charge of the two innkeepers of the Suldén and Trafoi Valleys, of the Herr Curé of Suldén—himself the proprietor

of an inn—and of the guides of the district. Having expatiated on the responsibilities involved in the charge, he concluded by expressing his thanks to every single person who had assisted in the work, to the various sections of the club, their committees and their subscribers; to the planners and superintenders of the work; to the masons, carpenters, and painters employed upon it; to all the members of the club, and all strangers there present; and finally, to the brass band, which had in so *liebenswürdig* a manner contributed to the success of the day. A glass of wine was handed up to him; at word of command three precise, regular, and loud "Hochs!" were roared out by the eighty-six, and the band struck up once more the Austrian national hymn. Then followed speaker after speaker, all eloquent on the same theme: the perils of the snow, the delight and the security of such an asylum (*asyl*); above all, the energy and liberality of the Prag section and Herr Präsident Stüdl. The Munich section, the Wurtemberg section, the Vienna section, and many sections more, each had its innings of eloquence, and proposed its peculiar toast: and to each the company replied with a thrice-repeated well-drilled "Hoch!" One speaker alone, an Italian, representative of the Sondrio section of the Italian Alpine Club, worked up his hearers beyond the height of a measured enthusiasm by a vein of sentiment pitched in a higher key: "His feelings were too deep for words, the feelings of every one present, he could see, were too deep for words also;" and, after exhausting the vocabulary of sentiment to describe the glory of the mountains and the efforts made by man to overcome their perils, he rose to the crowning glory of the Payerhütte: "On such a spot every noble feeling of the heart rose to its highest power, every ignoble one sank to its lowest; all barriers of race, creed, and station between man and man were cast down in the sense of a common humanity; and the soul, freed from every taint of sin, was lost in the love of purity, of freedom, and of man (*Menschheit*)!"

At this a murmur of "Bravos!" rose to the lips of the audience, for once disturbed from its gravity; and at the end of the speech the whole assembly responded, though with some astonishment, to our British "One cheer more!" More speeches followed, all in the same strain of earnest business; the President declared the hut open, and the official proceedings were at a close.

G. G. RAMSAY.

(To be concluded in next Part.)

SUMMER.

THE shepherd-boy is singing,
His sheep are resting still ;
The lark is upward winging,
The sun is on the hill.

Deep hidden in the distance,
The thrush throws out his strain ;
The cuckoo, with insistence,
Repeats the old refrain.

The linnet, crested rover,
Sings sweet from yonder tree ;
And now and then flies over
A humming honey-bee.

The mingling choir of voices
Is like a pleasant song,
When every one rejoices,
And would the joy prolong.

Sweet the artless unison,
And sweet the breezy blue,
And sweet the grass to look upon,
With daisies peeping through.

E. CONDER GRAY.

THE SERVICE OF STEAM.

I.—THE POWER OF MACHINERY.

By JOHN BOURNE, C.E.

MECHANICAL power is pressure acting through space. Mere pressure does not constitute or create power. There must also be motion, and the amount of the power is determinable by the amount of the pressure multiplied by the space through which the pressure acts. A mountain, a house, or any other heavy object resting on the surface of the earth does not generate power. But if a heavy weight, such as a ton of any material, be suspended by a rope, and allowed to descend towards the earth, it will generate power during the descent. One ton descending through one foot, will generate the same amount of power as half a ton descending through two feet, and so of all other proportions of motion and pressure or weight. The cylinder of a steam-engine, with an area of piston of one square foot, and with a stroke of one foot, will generate just the same amount of power per stroke as a cylinder with an area of piston of half a square foot, and with a stroke of two feet. This is tantamount to saying that with any given pressure of steam, cylinders of equal capacities, whatever their relative proportions of length and diameter, will generate equal powers during each stroke; and this is a fact well known to engineers. Whatever the machine may be, whether a steam-engine, a water-wheel, a roasting-jack driven by a weight, or any other mechanism, the general law holds good that the pressure or weight multiplied by the space through which it acts represents the power. Power is therefore measurable by foot-pounds just as ordinary matter is measurable by weight and bulk.

It will be obvious to even the most cursory inquirer, that machines of whatever kind divide themselves into two great classes. In one of these power is generated, and such machines are consequently termed prime movers. In the other class, the power already existing is only transformed, distributed, or applied. Steam-engines, water-wheels, windmills, electro-motive engines, solar engines, and all other instruments for the production of power, fall under the first class; while spinning and weaving machinery, wood-working machinery, hydraulic presses, tools, pumps, and instruments and apparatus of whatever kind that are driven by power, fall under the second class.

XVII—20

And here it is proper to remark that, although for the sake of convenience we talk of machines which generate power, to distinguish them from those which only transmit or consume power, the definition is in reality an incorrect one, as no species of machine can generate power out of nothing; and all that the machines called prime movers really do, is to intercept and utilise some part of the mechanical power which is circulating through the universe. So far as we can at present see, the whole of the power which we can render subservient to our uses, comes or came originally from the sun. Ericsson has lately constructed a solar engine, which is the practical realisation of an old idea, whereby the concentration of the sun's rays upon some fluid, causing its expansion, was to generate power. Water-wheels are driven by streams fed by rain, which was exhaled as vapour from the ocean by the sun's heat; and windmills derive their motion from currents of air set in motion either directly or indirectly by the sun. The mechanical power developed by animals is derived from the food they consume, which was grown and ripened by the action of the sun; and even steam-engines derive their power from the same source. The steam-engine is merely an instrument for obtaining power from the steam in the boiler, which power has been derived from the heat produced by the coal. But the coal is merely the legacy of primeval forests in which a structure of carbon was built up by the dissociating effect of the sun's rays, which decomposed the carbonic acid of the atmosphere, and separated it with an expenditure of mechanical power into its constituent portions of oxygen and carbon. The mechanical power expended in effecting this separation, is recovered when the two substances recombine; and the power now said to be generated by our steam-engines is merely the consumption of the power accumulated by the sun in primeval times when coal is used, or in modern times when wood is used. Coal, like gunpowder, is virtually a spring under tension, which in being let down generates power; and to reproduce the tension, as much power must be consumed as was obtained by the relaxation. This spring, however, is being perpetually wound

up for us by the sun ; and all that the machines called prime movers do, is to convert this potential energy into actual energy or mechanical power. The influence of the sun upon our planet probably extends further than has been hitherto suspected. We know that the attraction of cohesion may be dissolved by heat, as solids when subjected to a high temperature assume the liquid or vaporous form. Cohesion, therefore, is not an essential property of matter ; and there are good grounds for believing, that the same may be said of gravity. The force of gravity varies inversely as the square of the distance, and follows the same laws in this respect as light or sound. Two hundred years ago, Robert Hooke demonstrated experimentally, that an attraction resembling that of gravitation may be produced by creating a vibration in the particles of bodies ; and gravity may be the result of such a vibration in the matter composing the earth produced by the light of the sun.

In the application of machinery to the uses of life there are two main indications to be fulfilled. The first is to generate the power with the least waste or the most economy, and the second is to apply the power so generated to the work which has to be done in the simplest and most efficient manner possible. Water-power, where accessible, is probably the best and most equable motor ; but, in general, water-power is liable to interruption during droughts ; it is often only to be obtained in inconvenient situations ; and on the whole a preference is now very generally given to steam-power, even in cases to which either power is equally applicable. For railways and steam navigation, for draining mines, aiding the operations of agriculture, and for the multifarious uses to which motive power has now to be applied, the steam-engine is, in the present state of our knowledge, the only available motor ; for although gas-engines, electro-motive engines, and a few other kinds of motive-power machines, have been employed in some cases where a very small amount of power was sufficient, these contrivances have not obtained any such wide introduction as to be commercially important, or to require further notice here. It is the steam-engine which is the great source of motive power in modern times, and it is to its improvement that the efforts of engineers are therefore mainly directed.

It has long been known that one of the most effective expedients of economy in steam-engines was to use steam of a con-

siderable pressure expansively in the engine. In other words, steam of a high tension is maintained in the boiler ; but instead of allowing it to flow into the cylinder during the whole of the stroke, it is shut off by a proper valve after a small part of the stroke has been performed, say one-tenth, leaving the rest of the stroke to be performed by the expanding steam. Only one-tenth of the steam is thus consumed in performing a stroke, but there will be a good deal more than one-tenth of the power generated ; and the difference goes in favour of this system, which is consequently now very generally adopted. It has also been found advantageous to keep the cylinder hot, by surrounding it by another cylinder containing steam ; and to superheat the steam somewhat by imparting to it a rather higher temperature than that due to its elasticity, by the contact of hot flues or pipes applied for this purpose. All these expedients of economy are, however, only applicable within a limited range. A very high pressure of steam involves the necessity of a very strong and costly boiler, and a very strong and costly engine. If the expansion of the steam be more than ten times, not much economy is obtained from the higher grades, and a very large and costly engine becomes necessary to generate the power. If the steam be heated to a temperature much over 350° Fahr., the oil in the cylinder is carbonised, the hemp packing of the stuffing-boxes is burnt out, the faces of the slide-valve become rough, and so many practical inconveniences are encountered, that the attempt to employ higher temperatures has had to be abandoned. In the present practice of the best engineers, the considerations which weigh upon one side and the other of this question have been brought to a balance, and the consumption of coal has been brought down to about two pounds per actual or indicated horse-power per hour in the best condensing engines.

And here it may be convenient to explain that there are at present two kinds of steam-engines in common use, one, the high-pressure engine in which the steam, after having pressed the piston to the end of the cylinder, is dismissed into atmosphere, and the other, the condensing engine, in which the steam, after having pressed the piston to the end of the cylinder, escapes into the condenser, where, meeting with a shower of cold water, it is condensed, and forms a vacuum, which sucks the piston on the one side, while the steam presses it on the other.

By the intervention of the slide valve, which is moved by the engine, the pressure is alternately thrown on one side of the piston, and on the other, thus producing motion to and fro, which by the crank gives a rotatory motion to the shaft by which the power is imparted to the machines to be driven. Locomotive engines are necessarily high-pressure engines, and the spent steam is discharged from them in a series of puffs. Steamboat engines are almost uniformly condensing, and the water which accomplishes the condensation is discharged overboard as a stream of hot water. The large class of pumping and factory engines are generally condensing, while the bulk of small engines are of the high-pressure variety. High-pressure engines are less economical than condensing, as they lose the benefit of the vacuum which is got without any extra expense of steam or coal; but they are cheaper in construction, and may be introduced in many cases where condensing engines could not be applied. On railways, for example, it would be impossible to carry the large quantity of cold water required for condensation.

In all cases in which power is produced by heat, there must be two temperatures, and in the condensing steam-engine the boiler represents one of these temperatures, while the condenser represents the other, and the engine stands at the middle of the train. And just as heat may be made to generate power, so power may be made to generate heat. The bearings of steam-engines, if screwed too tightly down, become hot by friction, and the heat generated is the equivalent of the power which disappears. Rumford made water boil by the heat generated by a blunt borer when employed to bore a cannon; and in every case in which power disappears, heat is generated, or electricity, or some other form of power, which power is the equivalent of the mechanical power expended. Whatever has been predicated about the eternity of matter, may be also predicated about the eternity of power or force, and matter itself may only be a form of force. It has been ascertained by careful experiment that the power expended when a weight of one pound descends through seven hundred and seventy-two feet, or, what is the same thing, when a weight of seven hundred and seventy-two pounds descends through one foot, will generate heat enough, rightly utilised, to raise one pound of water one degree Fahr. in temperature. When, there-

fore, the water discharged by a waterfall seven hundred and seventy-two feet high is precipitated into the abyss, the mechanical power which might be obtained if the water had been employed to turn water-wheels or other hydraulic motors is not annihilated, but is transformed into heat, and raises the water one degree in temperature.

The discovery of the exact numerical equivalence of heat and power enables us to determine the mechanical efficacy of the steam-engine as a thermo-dynamic machine. For as each seven hundred and seventy-two pounds lifted one foot is equivalent to the raising of one pound of water one degree in temperature, the total power of the engine, if employed to generate heat, will, if the engine is a perfect one, reproduce the heat, as measured by the evaporation of water or otherwise, which was originally expended in the production of the power. When a heavy weight is lifted by a lever, there is no gain of power by the operation, but only a transformation of power. If the two parts of the lever be in the proportion of ten to one, then ten times the weight may be lifted by the hand with the aid of the lever that can be lifted unassisted. But the weight will only be moved through one-tenth of the distance that the hand moves; and the force or weight multiplied by the space passed through remains in all cases a constant quantity. So, also, if, by the aid of a crane, a weight be raised by one man, which could otherwise be only lifted by ten men, there will be no gain in power by the use of the crane, as the loss in speed will be in the exact proportion of the increase of raising force; and ten separate men, each with his crane, would only do the same amount of work in a given time that the ten men would do if conjointly employed to lift the weight direct. In all machines by which power is transmitted or transformed, whether a crane, screw, hydraulic press, or any other apparatus, there is neither gain nor loss of power, but merely such a modification of it as will make it more conveniently applicable to the purpose in hand—just as a cubic foot of iron may be beaten into a plate or into a bar or other form proper for a special purpose, though in point of quantity it remains a cubic foot of iron as before. While, however, this is theoretically true, there is in all machines a loss of effect from friction and other similar causes; so that in every transformation of power the exact amount originally expended will not be reproduced; but there will be a certain loss which will

represent the mechanical imperfection of the machine. In the steam-engine the same law holds. The exact equivalence of heat and power being known, it becomes easy to tell how much heat the power known to be exerted by a steam-engine should produce, if employed for that purpose, and that amount of heat ought to reproduce the power if the engine were a perfect one. But in practice it is found that the very best engines require ten times the quantity of heat to generate a given power that is theoretically shown to be necessary, on the supposition that there was no loss, and the conclusion is thus forced upon us that the steam-engine, even in its best modern form, is a very wasteful machine. The main cause of this waste is the low temperature of the steam in the boiler. Power is generated in thermo-dynamic engines by the subsidence of temperature from one point to another—just as power is generated in a water-wheel by the subsidence of the water from one level to another. The further removed these points are, the larger the amount of power generated will be. But in a steam-engine, while the temperature of the furnace is 3,000° Fahr., the temperature of the boiler is probably only 300° Fahr., and this stands at one end of the thermo-dynamic chain, while the condenser, with a temperature of 100°, stands at the other end. The effective fall is therefore only 200°; and power is wasted in much the same way in which the power of a waterfall would be wasted if only a tenth of the fall were utilised in the production of power, instead of the whole amount. In a perfect engine no heat should pass away from the machine, either in the form of hot water or of waste steam; but the whole of the heat should be converted into power. Electro-motive engines are found to be much less wasteful machines than steam-engines. In other words, a certain quantity of mechanical power in the form of electricity can be transformed into useful work with much less loss in an electro-motive engine than the equivalent of heat can be transformed into useful work in a steam-engine. There is no cheap and convenient source of electricity, however, at present known, and so the steam-engine maintains its position as the accepted motor. Hereafter thermo-electric engines may be contrived, which will work with much less coal than any existing steam-engine, or a carbon battery may be discovered, or thermo-dynamic engines may be contrived, which make the furnace instead of the boiler the

top of the thermal range; but in steam-engines using a cylinder which imposes a limitation on the temperature, there is no probability that any material reduction in the consumption of fuel now necessary in the best engines will be obtained.

In the most improved modern engines, whether high or low pressure, the steam is uniformly used expansively, the cylinder is kept hot by a casing of steam called the steam-jacket, and the steam is superheated as far as can be conveniently done. But another improvement has also latterly been introduced, which affects the first cost of engines as well as their working economy: they are run at a far higher speed than was formerly attempted. In Watt's engines the maximum speed of the piston was about two hundred and twenty feet per minute; and with this speed, and with the moderate pressures of steam formerly subsisting, a very large engine was necessary to produce a moderate amount of power. Now steam-engines of the best class are run at six, seven, or eight hundred feet per minute, or even more; and the power generated, the pressure remaining the same, is in the simple ratio of the acceleration. To produce a given amount of effective power, therefore, a much smaller engine now suffices than was necessary some years ago, and the cost of an engine to do a specific amount of work is smaller. This reduction of the cost, without reduction in the quality of engines, is rapidly extending their use, especially as high-speed engines are not only cheaper than common engines, but also more equable in their action, and more economical in fuel. In slow engines there is a deposition of moisture on the interior of the cylinder, and a re-evaporation of this moisture at every stroke, which causes a waste of heat; whereas in high-speed engines there is no time given for this action to be carried on to any injurious degree. Then just in the proportion to the number of rotations of the crank in a given time is the action of the engine made more uniform and equable. In cotton-mills, water power was long preferred to steam power, as it was less subject to fluctuations in the velocity of the motion; and what was called "water twist" commanded a higher price in the market than thread spun by steam, in which, from the fluctuations of velocity at different parts of the stroke, there were appreciable irregularities. To amend this evil, very heavy fly-wheels were employed; but the best remedy consists in driving the engine faster, which moreover produces

several collateral advantages. The ultimate velocity required to be given to the machines of a cotton-mill, and to a very large proportion of all kinds of machines, is a high one; and when such machines have to be driven by a slow engine a great deal of intermediate gearing has to be employed to bring up the speed to that degree of velocity with which it is necessary the shafting should revolve. Such gearing is not only costly and liable to derangement, but it absorbs no inconsiderable proportion of the power. It has been reckoned that in a cotton-mill of the old kind about nine-tenths of the total power of the engine is absorbed in giving motion to the machinery, only about one-tenth being consumed in doing useful work; and any expedient which reduces the amount of intermediate gearing is consequently important. The best expedient, in every way, is to employ a swift engine. By its aid geared wheels may be wholly discarded, and the entire machinery may be driven by noiseless belts. In factories of every kind, this is the course of improvement which is now being carried out.

To fit an engine, however, for working at high speeds, various precautions have to be observed in its construction, as if an engine of the old type were to be driven at a high speed the bearings would heat and wear quickly out, the parts would shake loose from the shock and jolting, and the engine would probably break down. The indications which must be observed in the construction of a high-speed engine are as follows:—

All the rubbing surfaces, and especially the bearings of the shaft and crank pin, must be made very large, as the wear will be slow in the proportion of the wearing area. If the engine be a condensing one, the valves of the air pump must not be of metal, else they will hammer themselves too violently, but the valves must be made of india-rubber; the whole of the rubbing surfaces must be efficiently lubricated, and finally the weight of the moving parts must be made as small as possible, and their momentum must be balanced by counterweights. An unbalanced engine, however perfect otherwise, will necessarily work with jolt and tremor, as the piston and its connections being brought to rest at the end of every stroke, will necessarily discharge their momentum on the crank pin, and through it on the shaft, whereby the engine bed will be pushed to and fro. But if weights equal to that of the piston and its reciprocating connections

be fixed upon the crank, on the opposite side from the crank pin, the momentum of these weights will exactly balance the momentum of the reciprocating parts of the engine, and there will be no tendency to move or rock the engine bed at all. High-speed engines, therefore, must be properly constructed for their intended work, and if not so constructed they will give perpetual trouble. But when properly made, they offer many advantages, as they are cheaper than common engines, consume less coal, are more equable in their motion, and are lighter, more compact, and more portable, while they enable much costly and cumbrous gear to be discarded.

So much for prime movers. With regard to moved machines, instruments, or apparatus, it is plain that without their aid, mankind could never have emerged from barbarism, as it was by the saving in labour effected by their use that it became possible to do something beyond providing for the physical wants of the passing day. The primitive flour-mills still to be met with in eastern countries were a great improvement upon the pestle and mortar or two stones of earlier times. The early loom was a great advance upon the darning needle, and the spindle and distaff an advance upon the methods which preceded them. The plough and the saw, both of them devices dating from a remote antiquity, were valuable chiefly as labour-saving machines; and the spinning-wheel, producing one thread at a time, was the immediate progenitor of the spinning jenny. All these contrivances, whether they derived their motion from the power of men or animals, were of signal value to mankind. But the benefit was greatly increased when the motive power was derived from the inanimate forces of nature, such as wind, water, or steam. For many ages, Holland was saved from being drowned out by the use of windmills, which worked pumps and archimedian screws, by which the water which would otherwise have spread over the land was lifted into the rivers. Windmills, which had been used from time immemorial in the East, were, it is believed, first brought to the knowledge of western nations by the Crusaders. But water-mills were known to the Greeks and Romans. It is in modern times, however, that machinery has received its great development; and in all the arts, it is every day being more extensively employed. It is plain that railways and steam navigation could not have had existence, but for the antecedent improvements in the steam-engine, which

rendered them possible ; and it is difficult to conceive how modern nations could be fed or clothed without the aid of that machinery by which the operation is at present performed. The scale of comfort has been raised, the evils of climate have been redressed, and famine has been shorn of its terrors, by the wide introduction of machinery ; for by its aid commodities have been so cheapened, that the luxuries of one age have become the necessities of its successor, and are brought within the reach even of the indigent classes ; while locomotion has been so much facilitated, and wealth has been so much increased, that the produce of all countries is brought to our doors and placed within our means of acquisition. Machinery has been the true philosopher's stone of the world, as it has enormously increased the productive power of labour, and has thereby added to the rewards which labour earns. The military art, like most other arts, has been revolutionised by machinery. Our iron-clads are its offspring. How without its aid could great iron plates two feet thick be rolled out like dough by the hand of the baker ? How without the steam hammer could the great coils of iron be welded up which are used to form our hundred-ton guns ? Our breech-loading rifles are made by special machinery, not merely with an accuracy, but with a cheapness unknown to former times. As an illustration of the great saving of cost, which appropriate machinery will accomplish, even in such an article as rifles, it may be stated that, whereas some of the early examples of our modern military rifles made without special tools but with the usual implements employed by the best private gunsmiths a few years ago, cost the maker £63 each, when produced as individual samples, the same weapons are now made in quantity by

special tools at a cost of £3 each. Such is a specimen of the saving in cost which machinery can achieve !

One of the arts to which machinery has only yet been very partially applied is agriculture. And here its benefits promise to be very great. At present, most of our farms are badly adapted for the application of machinery, being split up by hedges and ditches, into a number of small and irregularly shaped fields ; whereas for the beneficial application of steam machinery, a farm should consist of only a few large fields, with an appointed rotation of crops. Gradually, however, hedges and ditches are being removed, and the land is being laid out so that steam machinery may be conveniently introduced. In such countries as India, where the heat of the sun renders physical labour oppressive, and where much of the land consists of vast alluvial plains hundreds of miles in extent, the steam-plough and steam-reaper promise to be specially valuable, the more so as the fertility of the soil can also be aided by steam irrigation. In tropical climates water is the most essential condition of fertility ; and even in the best districts the productiveness of the soil can be increased threefold by irrigation. To mine water in the tropics is consequently a more profitable operation than to mine gold in Australia ; and yet in this great field the introduction of steam machinery has scarcely yet been begun. More and more the tendency is for England to become one great city drawing the agricultural produce she requires from India and from the colonies, sending manufactures in return ; and this interchange of commodities is rendered easier every day by the improvement in the means of transport which the steam-engine has brought about, or still promises to achieve.

CHARLES KINGSLEY'S CHARTISM.

THERE is no duty more incumbent than to try to understand those who have benefited us. If we should fancy that we have found a dark or a doubtful point in their character or career, it is at once unwise and unjust to isolate and to dwell upon that ; but it is perhaps even more so to ignore it as though it must be implicitly taken for granted in its darkest guise without examination. Now, we have convinced ourselves that this

last is the position too largely held with respect to what has been called the "Chartist" period in Charles Kingsley's life ; and with the recent biographic sketch by Mr. Thomas Hughes* in our hand, we are anxious to give our impressions on the matter, because we believe that Charles

* "Alton Locke." New edition, with a Prefatory Memoir By Thomas Hughes, Esq., Q.C., author of "Tom Brown's Schooldays," &c. Macmillan & Co., 1876.

Kingsley was more self-consistent than is commonly supposed. If we said boldly that, instead of being a Radical he was by nature a Conservative, we should but speak truth, though we might give rise to as great a misapprehension as that we are fain to remove. The words have taken on a strictly political reference; and Kingsley was not a politician. His immediate sympathies wholly determined his interests in respect of social and political questions, and the prominent position which he took at a very critical period was precisely the position which we should have expected him to take in such a crisis at any time. He was readily moved by the story of suffering, and having investigated matters and satisfied himself that the sufferings of 1847—50 were very real, he was soon convinced that political disabilities which were conceived to produce, or even to intensify such sufferings in the case of whole classes, could not possibly be in the interests of order. He very probably did not reason the matter out in any set scheme; it was enough for him that the structure of English society was threatened. He had too deep an affection for the old forms of our national life—too fine historical instincts, in fact—to be easily moved to favour new constructions; but the modifications that he sought were believed by him to amount to the saving of the whole fabric. It was not for the Chartists alone that he devoted himself to days and nights of earnest labour, it was for all classes alike as he believed; and if he put himself into extreme positions, or fell into extreme statements now and then, it was due mainly to the fact that he regarded the upper classes generally as failing at once in sympathy and in foresight. His intensely English sentiment in favour of fair-play also came in to help towards this result. He believed that the poor men had real wrongs to complain of, and that their petition had not received courteous treatment. He therefore rejoiced in showing that a clergyman could separate himself from the bulk of his class for the sake of seeing fair-play. And his position he justified even by reference to the Bible. He tells his working-men friends, "It is mainly the fault of us parsons that you have followed a bad 'Reformer's Guide.' They have never told you that the true 'Reformer's Guide' is the Bible, the true poor man's book. The Bible demands for the poor as much, and more, than they demand for themselves; it expresses the deepest yearnings of the poor man's heart far more nobly, more searchingly, more daringly,

more eloquently than any modern orator has done."

While, therefore, he was bent on conciliating the Chartists, as a means to bring them to that reasonable self-respect which would issue in a better form of union or association among themselves, he never omitted to emphasise the fact that political reforms would soon prove futile unless preceded or accompanied by reforms personal and social. So distinct are his enunciations on this head conveyed in his so-called "Chartist" speeches and letters, that we have been beyond measure struck by their correspondence to what he has said in his later writings, on which no suspicion has ever rested.

This is from one of his letters—the very letter which contained that sentence which, misread, brought down upon him vials of obloquy, which are hardly even yet exhausted:—

"I want to see you *free*, but I do not see that what you ask for will give you what you want. I think you have fallen into just the same mistake as the rich, of whom you complain—the very mistake which has been our curse and our nightmare. I mean the mistake of fancying that *legislative* reform is *social* reform, or that men's hearts can be changed by Act of Parliament. If any one will tell me of a country where a charter made the rogues honest, or the idle industrious, I will alter my opinion of the charter, but not till then. It disappointed me bitterly when I read it. It seemed a harmless cry enough, but a poor bald constitution-mongering cry as ever I heard. The French cry of 'organization of labour' is worth a thousand of it, but yet that does not go to the bottom of the matter by many a mile."

And then, after telling how he went to buy a number of the Chartist newspaper, and found it in a shop which sold "flash songsters," the "Swell's Guide," and "dirty milksop French novels," and that these publications, and a work called "The Devil's Pulpit," were puffed in its columns, he goes on to say,—

"These are strange times. I thought the devil used to befriend tyrants and oppressors, but he seems to have profited by Burns's advice to 'tak' a thought and mend.' I thought the struggling freeman's watchword was, 'God sees my wrongs.' 'He hath taken the matter into His own hands.' 'The poor committeth himself unto Him, for He is the helper of the friendless.' But now the devil seems all at once to have turned philanthropist and patriot, and to intend himself to fight the good cause, against which he has been fighting ever since Adam's time. I don't deny, my friends, that it is much cheaper to be reformed by the devil than by God; for God will only reform society on the condition of our reforming every man his own self, while the devil is quite ready to help us to mend the laws and the parliament, earth and heaven, without ever starting such an impertinent

and 'personal request,' as that a man should mend himself."

Before he finishes that same letter, he goes on to say :—

"I say honestly, whomsoever I may offend, the more I read of your convention speeches and newspaper articles, the more I am convinced that too many of you are trying to do God's work with the devil's tools. What is the use of brilliant language about peace, and universal love, when it runs in the same train with ferocity, railing, mad, one-eyed excitement, talking itself into a passion like a street woman? . . . I denounce the weapons which you have been deluded into employing to gain you your rights, and the indecency and profligacy which you are letting be mixed up with them. Will you strengthen and justify your enemies? Will you disgust and cripple your friends? Will you go out of your way to do wrong? When you can be free by fair means, will you try foul? When you might keep the name of Liberty as spotless as the heaven from which she came, will you defile her with blasphemy, beastliness, and blood? When the cause of the poor is the cause of Almighty God, will you take it out of His hands to entrust it to the devil? These are bitter questions, but as you answer them so will you prosper."

Plain, honest words, and wise withal, worthy of the man and of his profession, and deserving to be well-conned even now, for they are surely as suited to us in the present time as to those to whom they were originally addressed. The same things have been urged by Carlyle, by Gladstone, by Lord Shaftesbury, and by Edward Denison, none of whom are likely to be suspected of low, revolutionary, Chartist views. But in the course of that letter he had said, "I am not one of those who laugh at your petition of the 10th of April: I have no patience with those who do. Suppose there were but 250,000 honest names on that sheet. Suppose the Charter itself were all stuff, yet you have still a right to fair play, a patient hearing, an honourable and courteous answer, whichever way it may be. But my only quarrel with the Charter is, that it does not go far enough in reform."

Then he proceeds to write precisely where we began our first extract, from which it will at once be seen that what he meant was, that the Charter omitted to touch what he held to be the fundamental point where personal and moral reform becomes possible. Nothing could be plainer. The sentence was caught up and used as though it had been a political adventurer, and not a disinterested social reformer and religious teacher

who spoke. To make it plain how little the vulgar radical ideas of equality of wealth, share-and-share-alike, and confusion of classes, had quarter from Charles Kingsley, this needs but to be quoted :—

"I believe that a man might be, as a tailor or a costermonger, every inch of him a saint, a scholar, and a gentleman, for I have seen some few such already. I believe hundreds of thousands more would be so, if their business were put on a Christian footing, and themselves given by education, sanitary reforms, &c., the means of developing their own latent capabilities. I think the cry, 'Rise in Life,' has been excited by the very impossibility of being anything but brutes, while they struggle below. And I believe from experience that when you put workmen into human dwellings, and give them a Christian education, so far from wishing discontentedly to rise out of their class, or to level others to it, exactly the opposite takes place. They become sensible of the dignity of work, and they begin to see their labour as a true calling in God's Church, now that it is cleared from the accidents which made it look, in their eyes, only a soulless drudgery in a devil's workshop of a world."

We cannot help regarding these letters and speeches of 1848-56 as a manly effort for order at a time when so many influences threatened instability and revolution in our country. There is much in them that may even now be found useful in reference to the question of bringing working-men into churches, and making them sober and loyal. Kingsley's words must have frequently acted as a corrective to the wild and feverish tirades of trades' leaders. In not a few respects, indeed, the direction which sanitary improvement, as well as wise philanthropic and political effort is taking now, may be regarded as a confirmation of much that Charles Kingsley said in these Reform Speeches and Letters. It is because we owe him such a deep debt of gratitude for pleasure, and for many wise and cheerful words, that we have taken it upon us to try to show that his "Chartism," which was the outcome of practical sympathy, rather than a reasoned political scheme, in any respect, was not of quite such a mad and dangerous sort as has often been asserted.

H. A. PAGE.

SKETCH OF A JOURNEY ACROSS AFRICA.

By VERNEY LOVETT CAMERON, LIEUTENANT ROYAL NAVY.

PART I.—ENGLAND TO KAWÉLÉ UJIJI ON LAKE TANGANYIKA.

ON the 30th of November, 1872, I and my old friend and messmate Dillon, an assistant-surgeon in the Royal Navy, left Victoria Station by the evening mail, being then the only two members of the "Livingstone East Coast Expedition." Our object was to find Dr. Livingstone, and place ourselves unreservedly under his orders to carry out any geographical work which he might desire.

From the tenor of the last letters received from the illustrious veteran of African travel, we expected that on our meeting him we should be ordered to proceed northwards to explore the "Mwutau Nzigé" ("Albert Nyanza"), and Victoria Nyanza Lakes, but "l'homme propose, Dieu dispose."

We were ordered in the first instance to join Sir Bartle Frère at Brindisi, and to proceed with him to Zanzibar, where we were to receive our final orders. On arrival at Brindisi we found that Sir Bartle was still at Rome, and that there was no room for us on board the Admiralty yacht *Enchantress*, which had been ordered to take him to Zanzibar.

We therefore, after a delay of six days, proceeded to Alexandria by the P. and O. steamer *Malta*, where Sir Bartle arrived a day or two after us. We went with him to Cairo, where his good offices procured for us from H.H. the Khedive an official letter of recommendation to all under his employ in the Soudan. Though this letter was never used in the countries for which it was intended, it was accepted by Arabs in the interior of Africa as a proof that we were friends with one whose name is known to all educated Mahommedans. We then went on to Aden, where Dr. Badger procured for us another letter from Said Alwyn ibn Said, a saint living near there, which was the most effectual talisman of all.

Whilst at Aden, Lieutenant Murphy, R.A., volunteered to join the expedition, paying his own expenses, if the Indian Government would continue him in the pay and allowances of his rank. To this they readily assented, and he afterwards joined us at Zanzibar. We then went on to Zanzibar in the B.I.S.S. *Punjâb*, Captain Hansard, and received the kindest attentions from him and his officers.

When we arrived at Zanzibar, after a very pleasant passage, I found myself attacked by an old enemy, the "coast fever," and was obliged for a time to take advantage of the kindness of some old messmates, and lie up on board the *Briton*, whilst Dillon went on with preparations for the road by himself. Unfortunately, our heavy stores from England did not arrive as soon as we did. The *Agra*, on board which they were shipped, had been compelled to put back into Plymouth by bad weather, and we had therefore, before her arrival, to get a small supply of arms and ammunition from the flagship of H.E. Admiral Cumming.

As soon as I was able to get about again, I went ashore and joined Dillon at the English gaol, where rooms had been put at our disposal by our old and kind friend Dr. Kirk. As soon as we had engaged our escort, and got some donkeys and stores, we chartered a couple of small Arab dhows, and went over to Bagamoyo to try and get the porters necessary to transport our stores.

When we arrived, we hired rooms for ourselves in the house of Abdûlah Dina, a Mussulman trader from India, who was very profuse in offers of service and assistance, but, like the rest of his race, could not resist the temptation of cheating Englishmen when he had a fair opportunity. Our men and stores were housed in a large thatched wattle and dab erection, belonging to Jemadar Issa, which we dignified with the name of the barracks, and in an open space in front of it we had our donkey lines.

Bagamoyo, like most of the sister towns along the Zanzibar coast, is a long straggling irregular sort of street with short offsets, and lying behind the sand hills which line the shore. There may be half-a-dozen stone houses, but the greater portion of those of the semi-respectable people are merely large buildings of wattle and dab, thatched with plaited cocoa-nut leaves. A few flat-roofed mosques provide for the religious wants of the inhabitants, but they are only resorted to on great feast days.

The greatest and most important feature, however, at Bagamoyo is the French mission, an off-shoot of that at Zanzibar.

Two or three priests, half-a-dozen lay brothers, and the same number of sisters, do

all the work. The pupils are instructed in industrial trades, and all the buildings of the mission have been erected by them, under the direction of the lay brothers. They have large and admirably kept gardens, and are trying to introduce several new and valuable plants into the country.

The pupils are kept under surveillance after they have grown up, and are encouraged to marry amongst themselves, and to bring their children to be baptized and brought up at the mission, so that there is a great hope that Christianity is getting a good grip on the continent of Africa, at least in this one spot.

From the members of the mission we experienced the greatest imaginable interest, telling us that they looked upon us as missionaries as well as themselves, and they could have paid us no higher compliment. After engaging what men we could, we had to go back to Zanzibar to meet the mail from Aden, by which we expected our stores. When we arrived at Zanzibar we found that the mail had already arrived, and that Murphy and our stores had come down in her.

As soon as possible we returned to Bagamoyo, and went on with the tiresome work of paying *pagazi*, and trying to keep loads within compass. As I found the men were rarely forthcoming at our morning musters, I thought it would be best to form a camp a short distance from the town, and accordingly selected a lovely spot shaded by four or five enormous mango-trees close to Shamba Gonera, a farm owned by the widow of a Hindu merchant.

Notwithstanding this move, we were still much troubled by our men absenting themselves, and also by their being induced to desert by the lower orders of Wamirina.

I wrote to Dr. Kirk, to ask if he could pay us a visit so as to show that we were still under the influence of British power, which he at once did, and I think his coming over to see us moderated the evil to some extent. After his return to Zanzibar, we redoubled our efforts to get away, and Dillon went on with what men could be dragged together to Kikoka, the most distant outpost of H.H. Syud Burghash's Balooches. After his departure, Murphy and I were both down with fever, and Murphy was so bad that he had to be taken in and nursed by the good French *padrés*. Dillon also came back to see him. The same day Sir Bartle and his staff came to Bagamoyo in the *Daphne*. He brought with him another volunteer for our expedition, Moffat, a grandson of the famous father of South African

missions, and a nephew of Livingstone's. Dillon went back at once to Kikoka, and two days afterwards I and Moffat joined him there with some more men and donkeys. I then sent Moffat back to assist Murphy, and with Dillon set out for Rehenneko, where we were to wait for the other two and what portion of the remainder of the stores they could obtain porters to carry.

Dillon and I left Kikoka on March 28th, 1873, and although we had used every conceivable precaution to prevent the absence of our men, and had not brought out so many loads as we had men in our camp according to our daily muster, we found that we had to leave twelve or fourteen loads behind.

We made our way along between Stanley's route and the Kingani, through an open park-like country, with clumps and strips of jungle and forest-trees and some tracks of game. No villages were directly on our route, and after three marches the men declared that they must go out to look for food, and that there was a village near. I went out with them, in the hopes of seeing some of the domestic life of the natives, and saw a few miserable huts; but shortly after we left our camp it came on to rain in torrents, and we saw scarcely anything and got less. On our way back to camp we lost our way and got benighted in a swampy wood, where I had to sleep (or try to sleep) in the least wet spot I could find, with my back up against a tree and the rain beating on me the while.

Next morning I was only just able to creep into camp; but on that and on the following day our foraging parties were more successful, and the third day we were able to go on again, having obtained a modicum of cassava. During our halt here, Moffat came out to us with letters, and the day we went on returned again to Bagamoyo. Poor lad, it was the last time I saw him.

I was suffering from a violent attack of fever, brought on by my mud and water bed, but managed to hold on to my donkey from camp to camp somehow or another. The country up to Msuwah was much the same as we had already passed through, but then it began to rise more decidedly. At Msuwah, we were detained a few days to try and get food, and by having to pay tribute to the chief, who was a regular black Pecksniff. He said our men could not buy food there, and that he would get it for us; but that cloth, &c., must be paid in advance. After two or three days' waiting, and only a small proportion being forthcoming, we thought it

best to go on, and let the smiling old man pocket the plunder in peace. We then went on by Kisémo over a small table land, well watered with magnificent stretches of open grass, and much cultivated land, with the villages hidden in patches of jungle, and only betrayed by the blue smoke wreathing above the tree-tops; and at the end of our second march arrived, after an almost precipitous descent, in the valley of the Lugerengeri. Behind us was the wooded steep which we had just come down, around were villages with thatch-roofed huts, patches of tobacco, rice, sugar-cane, and other crops; in our immediate front the river, brawling over its wide shallow bed, but the banks showing terrific signs of its giant power when swollen by the tropical rains; and beyond it, again, the lovely Duthumi hills, with their wooded summits crowned with fleecy clouds.

We went on across the wide Lugerengeri, and then made a nearer acquaintance with the hills, and found that picturesque forms entailed very rough walking and hard work; and on our first march we were from 4.30 A.M. till 3 P.M. on the road. Indeed many of the stragglers were not up till long after sunset. Our camp was in a rocky pass, with pools of crystal water amongst the rocks at the bottom, and around us flowering creepers and acacias in the full wealth of their golden blossoms.

We passed on out of this lovely spot into a basin-like valley full of small conical hills, each crowned with a tiny hamlet, and crops of the richest luxuriance growing all about us. Out of this "happy valley" (except for slavery) we fought our way through thickets of tall cane grass. It was tantalizing to know that all around were lovely views, while we could see nothing five yards from us, and then through a steep and narrow pass we came again into the valley of the Lugerengeri.

Passing along through cane-brakes, and crossing wide torrent-beds, all going to feed the river, strewn with blocks of granite brought down in the freshes which, in a brief half hour, spread destruction around, and then leave a tiny trickling stream in their place, we came to Simbawéni, erstwhile the home of the renowned freebooter and kidnapper of slaves, Kisabengo, but since his death ruled by his favourite daughter, who lacks the power, but not the will, to make her name as dreaded as was ever that of her robber sire. The mud-built palace is now, however, falling to pieces; and there are great gaps in the strong palisades which

form the enceinte, some hastily repaired, and others still open.

We passed the den of this lioness without paying any tribute, and only paid the compliment (?) of closing up our men and displaying the union jack and white ensign as we defiled past the town.

We then crossed the Lugerengeri a second time, on an African bridge made of a fallen tree, and so away from the country of Simbawéni. Whilst camped on the Lugerengeri, we were crowded with people selling food, many of them dressed in kilts made of grass fibre, resembling those of the mop-headed Papuans, with filed teeth, and heads oiled and besmeared with red clay.

Our men did not like to leave the Papuan plenty of this place, and after a day's halt we had much trouble to make them shoulder their burdens and take the road again.

From among the hills we came out on to the Makata Swamp. At first our road lay along a grassy level plain, but gradually we began to get into the "Slough of Despond," the mud getting deeper and stickier, and the donkeys and men floundering more helplessly at every step. To add to our discomfort, it came on to rain heavily, whilst still some distance from camp; and we had to drive the lazy and cheer the flagging for five hours of mud and rain, during which time we only got on about three and a half miles.

Next day, however, was better, and we crossed the river before evening. Notwithstanding, after a night's heavy rain, the bridge by which we had crossed was clean out of sight, and if we had been a day later we might have been detained a week before we should have been able to cross it.

From the river Makata on to the base of the Usagara mountains was good level marching, with the exception of two swamps, each from three-quarters of a mile to a mile long, and about mid-thigh deep. We arrived at Rehenneko, where we were to wait for our companions, on the 1st of May. Our camp was formed on a conical hill, at the mouth of a gorge in the Usagara mountains, on the opposite side of which lay the village of Rehenneko.

When Dillon and I arrived, we were both laid up, he with an acute attack of dysentery, and I with an abscess on my foot, and fever and ague.

As we gradually recovered, we employed ourselves with altering and fitting donkeys' saddles, which up to this had given us a great deal of trouble; and also in taking sights for latitude and longitude. The

people at Rehenneko were pretty friendly to us, though they do not bear the best of names; but I think they thought we were too hard a nut to crack.

The month of May passed slowly away, and the Masika, or rainy season, finished; but no news arrived of our companions, whom we were most anxiously expecting. I sent back two or three sets of messengers, and could get no news, till about the 22nd I heard they had just passed Simbaweni.

About the 26th a caravan hove in sight. It must be them, for there is a white man, but only one. Where is the other?—a question, alas, to be soon answered. As the party drew near, I limped out of camp to meet them, and found Murphy looking very ill, mounted on a donkey. "Where's Moffat?" I cried. The answer was, "*Dead!*" "How? When?" "I will tell you when I get into camp. I am too ill to say much now."

Afterwards we heard the sad tale of his end. Beaten by the climate, he lay down and died just before arriving at the Makata Swamp, to add another name to the list of martyrs in the cause of African exploration.

Poor young fellow! He had sold his all, a sugar-plantation at Natal, for £600, and came to Zanzibar prepared to devote the last farthing to the cause of this expedition. He died on the threshold of the unknown country where his grandfather had laboured nobly for more than half a century, and where his gallant uncle had already (though we then did not know it) succumbed to disease, hunger, and hardship. If he had been spared, he would have been a worthy successor to those two great and noble men.

When Murphy arrived he was suffering from the remains of an attack of fever, and we therefore remained at Rehenneko two or three days in order that he might recruit his health. I fear that much of his and Moffat's illness was caused by neglecting the daily use of quinine.

The days before we started were employed by me in overhauling all our loads, and redistributing, so as to avoid as much as possible any delay on the road.

Our route from Rehenneko lay over the Usagara mountains, up and down steep, rocky hills, over great bare and slippery sheets of quartz and granite. Notwithstanding the rocky nature of these mountains, they were mostly wooded to the summits, principally by acacias, which, as Burton very aptly observes, reminds one much of a crowd of people sheltering themselves under umbrellas.

In the hollows and dips where water collects, the noble mparamusi rears its lordly head. This tree is one of the most splendid specimens of arboreal beauty in the world. A tall, clean, towering shaft, running to a hundred and fifty, or even two hundred feet, without a knot or excrescence to break its symmetry, and crowned by a spreading head of dark green foliage. The natives have a proverb about this tree, and it is supposed to be impossible to climb one. When they think anything is beyond their powers, they say, "We have climbed many trees, but this one is indeed an mparamusi, and this one we can't climb."

Passing over the first part of the mountains, we came into the gorge by which the Mukondokwa breaks through the side of the mountains. Our camp above it was on the steep hillside, and for comfort one might as well be on the side of a roof. The next day we crossed the Mukondokwa, a swift and brawling stream of turbid water about knee-deep, and eighty yards wide. We crossed at the old village of Kadetamaré. This is not entirely deserted; the chief having learnt the danger of this position when the larger part was swept away by a fresh of the river at the time of the great hurricane at Zanzibar. has now settled on an adjoining knoll.

From the river we went along through gigantic crops of mtama or Caffre corn, the stalks being often from sixteen to eighteen feet high, and camped near the village of Muinyi Usagara. We were delayed here by one of our men accidentally shooting a native when a party was sent out for food, and before we could leave had to pay a heavy fine of cloth to his relations. When this matter was settled (for which we were indebted to the good offices of a gentlemanly old Arab settled near), we started on our road again, passing up the right bank of the Mukondokwa, through a rough and tangled country, the path in places almost overhanging the river, so that a false step or slip would have sent one down fifty feet into its muddy waters. The hills here were mostly of granite, but occasionally great masses of new red sandstone showed out, forming a vivid contrast to the foliage of the trees and creepers and the more sombre tints of the weathered granite.

Quitting Burton's route, which turns sharp off over the Rubeho mountains, we made our way up to Lake Ugombo, after having twice more forded the Mukondokwa. Lake Ugombo is full of hippopotami, and numerous waterfowl speckle its surface.

From Lake Ugombo to Mpwapwa, distant two long marches, no water is to be found, so we were initiated into one of the incidents of African travel, commonly known as a *terekesa*, viz., a forced march after noon.

Just before we left Lake Ugombo we saw a mixed multitude of men, women, children, and goats travelling to the valley of the Mukondokwa. They were carrying all their household utensils with them, and on inquiry we found that their homes near Mpwapwa had been harried by the Wadirigo, a predatory highland tribe, and that they were escaping with what they had been able to save.

We left Lake Ugombo at about eleven A.M., and marched across a parched and arid country, with great blocks of granite strewn about its arid surface, the vegetation being only euphorbiæ, kolqualls, &c., and baobabs, with a few patches of coarse grass already parched up by the burning sun of the tropics.

We camped out with the sky for our roof, and a gunstock for our pillow, and were off before daylight to make our way to Mpwapwa, passing through a thorny jungle, and across open tracts with scarce a blade of grass or a weed on their burnt-up surface. About half-past two in the afternoon, we arrived at the sandy bed of the stream at Mpwapwa, and going up it soon came to pools, and then to running water, which soon, however, filters away through the sand. I sent back men with water for those who had straggled behind, but notwithstanding this precaution, a man and a donkey fell victims to this trying march.

Mpwapwa, situated on the slope of the hills and well supplied with water, was a land of plenty, but prices were high as the Wadirigo had looted many of the neighbouring villages. The Wadirigo were a fine manly looking race, who carried a huge shield of bull's-hide, a heavy spear, and a sheaf of beautifully finished assegais. They walked about among the villagers like people of a higher race, and told them coolly that they only held their cattle and villages at their pleasure.

Although these Wadirigo were physically a fine race, they wore no clothes (many even of the women being perfectly naked, except perhaps a string of beads round their necks), and built no permanent villages. They are much feared by all the tribes in their vicinity, but unless opposed they do not kill or maltreat their victims, or make slaves of them.

Mpwapwa is a very favourite halting-place,

being situated between the arid tract reaching to Lake Ugombo, and the desert of the Marenga Mkali.

After a couple of days' halt to rest our men after their trying march, we went to Chunyo, the last camp before starting to cross the Marenga Mkali.

On our road we passed a village occupied by the Wadirigo, and, as with most thieves, it was light come light go, we got some goats and a couple of small bullocks cheap from these roving caterans. To obviate the inconvenience of being without water during our march across the Marenga Mkali, I filled four india-rubber air pillows with water, which held three gallons each, and besides giving us plenty for ourselves, allowed us some to spare for the weaker men and donkeys. The Marenga Mkali is a desert plain rather more than thirty miles across, reaching from the inland base of the Usagara mountains to the eastern limits of Ugogo, and scattered about are numerous small irregular granite hills, many of a conical form.

There are many watercourses, which are flooded in the rainy season, and I am firmly of opinion that water might be obtained by digging.

On our march across it we saw many zebras and other wild animals, but were unfortunately unable to get within shot of any.

Our camp at night, under a grove of thorny acacias, was a scene for a poet instead of a sailor to describe.

No tents were pitched or huts built, but every knot of two or three men had its separate fire. Above, the velvety sky, with its golden lamps, then the canopy of smoke looking like frosted silver, next trees looking as if made of ebony and ivory, and, below, all the blazing fires with the wild figures of the pagazi and askari moving about amongst them.

After leaving our camp we marched across a broken sterile country with thorn brakes and dry nullah, or sometimes a sandy plain, till we reached the outskirts of Ugogo.

Here we arrived at extensive plains, largely cultivated, but now, after the harvest, and in the midst of the dry season, parched and arid. The country, however, supports large herds of cattle, which seem to subsist on the dry stalks of the Caffre corn.

The natives made us pay before we were allowed to let our thirsty donkeys drink, or to cut the stalks of the corn to feed them on. The only growing crop was a small and tasteless water-melon, and as one or two of the men

who picked one to quench their thirst were unfortunately detected, we had to pay a heavy fine. At this camp occurred a desertion *en masse* of a body of Wanyumwezi, hired by Murphy at Bagamoyo. He had entrusted their payment to Abdoolah Dina, and that worthy had paid them in such vile cloth that when they saw what the men who I had paid personally had got, their anger rose, and shortly after sunset they levanted.

We marched from this station to the vicinity of the *tembe* of the chief of the district, when we were fully initiated into the delays and vexations incurred by every one who has any dealings with the Wagogo. The Wagogo are a bumptious, overbearing race, but, contrary to the opinions of most travellers, I believe them to be like all bullies, arrant cowards; however, in Africa, a bullying browbeating manner often passes for courage.

Their huts are miserable places, built round a square, in which at night the cattle are penned. Sheep, goats, and fowls share the huts of their masters; and smaller inhabitants are more in number than the sands of the sea.

The Wagogo, inhabiting a country which requires hard work to make it produce the necessities of life, are slave importers, and often tempt some foolish fellows to desert their Arab masters; only too soon do the fools find that they have exchanged from lenient masters to a bondage worse than that of the Egyptians.

The chiefs, as well as the meanest of the people, have to take their turn in tending the herds of cattle which form their principal wealth, the only privileges enjoyed by the chief being that he has, as a rule, more wives, obtains a larger share of the tribute, and can indulge in drunkenness oftener than his subjects. Their arms are bows and arrows and spears, and the more eastern portion of them also carry hide shields painted in a pattern of red, white, and black. Their ears are pierced, and the lobes so enlarged that in many instances they hang down to their shoulders. In them they carry gourds, snuff-boxes, and all sorts of heterogeneous objects. Their hair is dressed in a most fantastic manner. In fact, nothing seems to be too hideous or absurd for the taste of a Mgogo. After a delay of two or three days, caused by the drunkenness of the people during the mourning for a sister of the chief, which rendered them incapable of transacting any business, we marched for the next station.

Our road lay along a fairly level country, sometimes cultivated, sometimes thorny scrub, and sometimes sterile sand, till in the evening we arrived at a lovely pond about four hundred yards by two hundred in length and width, embosomed in a grove of green trees, with short turf-like sward stretching back from its shores. A complete oasis in the bosom of parched Ugogo. We formed our camp and feasted our eyes on the first fresh verdure we had seen since Mpwapwa. We found the chief here more reasonable than the one at Moumé, but still had to pay tribute as usual. We showed some of the people our guns, pistols, watches, &c., and one old man said, that people who were able to make and use such wonderful things, ought surely never to die. From this place we went along by a chain of small ponds, all frequented by waterfowl, and then through a broken country fairly wooded, till we arrived at Kanyenyé or Great Ugogo. Kanyenyé is a level plain, extending between the feet of two ranges of hills, and is ruled over by a chief of great age and decrepitude, concerning whom there are many stories. People say that he is now getting a fourth set of teeth, and that he is over three hundred years old. I have no doubt that he is considerably over the century. His grandchildren are grey and grizzled men.

From his *tembé* we went on across the plain of Kanyenyé, which in many places is covered with a coating of bitter, nitrous salt, which is collected by the natives and made into small cones like sugar-loaves, and sold by them to their neighbours. Ending the plain we came up a sharp ascent, at the top of which was a plateau, on which was a range of rocky hills, through which we marched, and came to Usekhé, where granite boulders of the most fantastic shapes and forms were scattered about. Concerning some of these there are curious stories, which the space at my command does not permit me to relate here.

Our next station was Khoko, which we reached after passing through a thick jungle, and here we camped close to the chief's village, under one of three enormous trees, a species of fig or sycamore; our own party, and other caravans accompanying us, in all amounting to about five hundred people, finding plenty of room under the shade of one.

We had now nearly finished Ugogo, the only other place being Mdaburu, a fertile vale situated on a nullah of the same name, which, in the rainy season, is a furious

torrent, and in the bed of which large and deep pools of water are found in the driest seasons. Here, as no white men had ever passed by exactly the same route as that we followed, we were detained in order to be stared at by the people.

Leaving Mdaburu we entered on what used to be dreaded as the *Mgunda Mkali*, or "Fiery Field;" but we found villages springing up all across, most being built by the Wakimbu, who, having been expelled from their former homes, are busy colonising this whilom forest.

Just after leaving Mdaburu we crossed the Mabunguru, another large nullah, and also one of the last affluents of the Rwaha, the more important of the two streams forming the Lufiji. From here we went on rising up over rocky hills, strips of thick jungle, bare sheets of granite, nature in her most lovely form, if it were not for tracts of miles and miles being blackened by fires, lighted by preceding caravans, both to drive game and to clear a way for marching.

Halfway across this "fiery field," we came to Jiwé la Singa and its surrounding villages. Here there is now a large population, fields well cultivated, numerous villages, some out in the open, others sheltered by groves of trees, but all surrounded by the inevitable stockade.

The fields here are mostly separated from each other by deep ditches and banks, and in one or two places I saw attempts at artificial irrigation. When Haji Abdullah (Burton) passed here in 1859, Jiwé la Singa, and one or two other small hamlets, were all that existed; but now this is one of the most populous and fertile places in Eastern Africa.

From Jiwé la Singa, our track again led through the uninhabited woods: spoors of giraffe and other big game were numerous, but caravan-marching in Africa is not the way for a Shikarry to enjoy himself, the men grunt and groan under their burdens, or some more spirited than the rest strike up a monotonous chant to lighten the fatigues of the way, and all game is most effectually scared. Besides, in these uninhabited tracts water is scarce, and the day's march is in consequence long, so that on arrival in camp, though game would have been an acceptable addition to our larder, we were too tired to go out shooting, unless we had neglected more necessary work.

During our marches here water was very bad, besides being scarce, and we were often fain to be content with stuff that any decent English dog would turn up his nose at.

At the end of this bit of wilderness we arrived at Urguru, one of the outlying districts of Unyamwesi proper, and yielding to the pressing invitation of the chief of the chiefs, camped in his village.

We were objects of intense curiosity to the inhabitants, and our tents were crowded the whole day with the rank, beauty, and fashion of the place.

Though very kind in their manners towards us, they left some disagreeable mementoes behind them in the shape of a variety of entomological specimens, which, however much they might be valued by the British Museum or the Linnean Society, were decidedly objectionable as companions.

We were now nearing Unyanyembé, the largest Arab settlement in Africa; but some heavy marching had first to be gone through.

Our first march from Urguru was through wild jungle, but with here and there strips of open grass; and in the evening we camped at a place called Simbo, where water is obtained a couple of feet below the surface by digging, and there are also numerous old water-holes at which the wild animals come to drink.

Next day, just after our start, we saw some buffaloes, and though Dillon started after them, they winded the caravan before we could get within range. After this we each took one side of the road, and I saw innumerable guinea-fowl, and also shot a small antelope. Besides this, I saw a cobra, and almost got caught by some Ruga Ruga (or banditti). As I was working my way back to the caravan, I saw what I thought was a camp and went to look at it, and found it a small but very substantial palisade partly roofed over, which I afterwards heard was a den belonging to these fellows. If they had been at home when I passed, nothing could have saved me. That night we camped amongst some enormous boulders at a place called Marwa, where water was only to be obtained by digging at the foot of one.

There is a legend about a destroyed village here, and it is considered unlucky to say Maji (water), or fire a gun, or pass by with one's boots on for fear of offending the demon in charge of the spring, and thereby causing him to stop the water-supply. From here we started before daylight, and in the grey of the morning Dillon and I saw a couple of lions trotting off home, after having been out on the range all night; and in the afternoon we heard that ruga-ruga were in front of us, and had attacked a small party who were preceding us by about half-an-hour.

On going to the front we found that this was quite true. The ruga-ruga had attacked the party and carried off some ivory and a couple of women slaves.

We went on to near a largish pond, and there encamped for the night. About nine P.M. some arrows were shot into our camp, but we had no more trouble.

The next day we arrived at one of the outlying villages of Unyanyembé, where we had to remain a day until news of our arrival had been sent on, according to African etiquette, to the Arab governor there.

The next day we marched into Kwikurul, the capital of Unyanyembé, and had breakfast with Said-ibn-Salim, the Arab governor, who afterwards, in company with a number of other Arabs, showed us the house which he had placed at our disposal during our stay, and which was the same he had lent Livingstone and Stanley during their stay here.

Kwikurul is the settlement of the native chief and several Arabs; and at Kwihara, where our house stood, are other Arab settlements. Besides these there are many other Arabs settled close to, some at, Kazeh or Taborah, and some at places which have different local names; but the whole is generically called Unyanyembé, although that properly is the name of a considerable district.

The various small settlements of the Arabs are scattered about—some on the plain, and some on a hill divided from the rest by another low and rocky hill. The total number of Arab traders now at Unyanyembé may number about two hundred; but sometimes three or four, or even more, live together, so that there are not above fifty or sixty large Arab houses, and some of these were the property of men away on different journeys, or who had gone to Zanzibar for fresh stores or a holiday. All the Arabs here possess large numbers of slaves, and use them as porters and to cultivate their gardens and farms.

The poorer Wamerima and Wasuahili do not give their slaves any rations, but tell them to go and steal food where they can find it; and these hungry wretches render it unsafe for any one to move about unless well armed.

Our time at Unyanyembé was a monotonous round of fevers and illnesses. We all had fever upon fever. Dillon lost the sight of one eye from atony of the optic nerve, and I was totally blind for about a month from a violent attack of ophthalmia, chiefly induced by the glare, wind, and dust.

The famous Mirambo (who, if all accounts be true, is more sinned against than sinning) was reported to be on the move on the route to Ujiji, and our men deserted daily. Others engaged in their place followed their example, and there seemed sometimes to be no hope of our getting away to the westward at all. However, I stuck to the resolution of getting on somehow, being determined never to turn back.

Towards the end of October, Chuma and another man belonging to Livingstone's caravan arrived, bringing a letter from Jacob Wainwright, announcing the melancholy fact that the great pioneer of African exploration was dead in the country of Ubisa, and that the whole party with the corpse would arrive in a day or two. I sent back cloth for the men behind, and soon after they all arrived.

All the principal Arabs assembled at our house when the body was brought there, in order to show respect to the memory of Dr. Livingstone; and as the men carrying the corpse entered the house, we hoisted our colours half-mast high. Murphy now resigned, saying that the object of the expedition had been achieved, and that there was nothing more to be done. I supplied Livingstone's men with stores for the journey to the coast, and redoubled my exertions to get away from Unyanyembé, which was becoming hateful to me.

A couple of days before the day fixed for starting, Dillon found that he was too ill to proceed, and reluctantly yielded to my persuasions to try and return to the coast, in the faint hope of recovering his health by a speedy return to his native land.

On the 9th of November the two parties left Unyanyembé, two homeward bound, and one Westward Ho!

The parting with Dillon was a sad wrench to me; but hope is long-lived, and I trusted that we might both live to talk over this parting in England. This trust, alas! was not to be fulfilled, for a week after our parting I received the news of his sad end.

He was a scholar and a gentleman, a good officer, a pleasant messmate, and one of my dearest friends; but he is dead on the "field of honour," as surely as if he had died leading a forlorn hope, or charging an enemy's battery.

I was much delayed by desertions and thefts, and forced out of my road by the cowardice of my men, so that in the beginning of December I met Murphy again in Uganda, as he also could not follow his direct route, and had had to send back to the

Arab governor for more cloth, as much had been wasted in drunkenness by the men, and some had been stolen.

Three days after I left him I was met by a chief who was at variance with the Arabs, and who refused me a road across his country. At last, on the 1st of January, we got a fair start, having lost and wasted a large quantity of stores, and been compelled to abandon twelve loads of beads, and throw away much of my kit and private stores on account of the desertion of porters.

Leaving the cultivated grounds of Uganda, we passed first across a level plain almost waterless, but with clumps of trees here and there where the water was near the surface, and came to the South Ngombé nullah. The country here was marvellously beautiful. Small mounds crowned with trees, groves, and bosquets, and broad reaches of the Ngombé reaching for miles and miles. In the rainy season much of this level country is under water, and we saw a dilapidated bark canoe about three miles from the nullah.

Game was very plentiful here, but wild, and I was unsuccessful in my attempts to get any. I saw a large white rhinoceros, wild boar, and several sorts of antelope; but all were scared by my own people, and by hunting parties from the neighbourhood.

From the Ngombé we passed on through Ugara, which is divided into three districts under independent chiefs. Most of this country at one time had been cultivated and populous, but most of the people had been destroyed or carried off as slaves in the various wars which are constantly going on, especially in that waged between Mirambo and the Arabs.

All the country of Ugara was nearly a dead level, with the exception of a couple of small hills near the centre, until we arrived on its western boundaries, but marvellously fertile; villages which had only been abandoned a year or two being almost hidden in the luxuriant growth of underwood.

After leaving Ugara my guides missed their road, and as I was dead lame from a large abscess on my leg, I was unable to take the lead of the caravan and direct them. After wandering some days in trackless woods, and fording many streams or crossing them in Matthews's india-rubber boat, we arrived at Mân Komo's, the chief of a portion of the mountainous country of Kawendi. Here we hoped to get food, but it was not forthcoming, as Mân Komo demanded a ridiculous tribute which I refused to pay.

Leaving Mân Komo's, we went on struggling over the mountains of Kawendi, hungry and tired, and little or no food to be obtained. The people, profiting by experience, have built their huts amongst almost inaccessible crags, and carefully defended the approaches; many of them, indeed, live in regular caves, and refuse intercourse with all passers-by.

One day during this march I was carried in my chair slung to a pole, as I was utterly unable to walk or ride, and suddenly I saw my men throw down loads and guns and skeddaddle up the nearest trees. The men carrying me also bolted, and I was left perfectly helpless and unable to move, and at a loss to know what the stampede was about. I had not long to wait, however, before I saw a buffalo charging down the line. Luckily he did not notice me, although he passed within twenty yards of where I was dropped.

After Kawendi we crossed the Sindi on a bridge of floating vegetation, and then arrived in Uvinza, where we got something substantial to eat, after a fortnight's starvation.

In Uvinza we had to pay heavily to the chief for permission to cross the Malagarazi, and then to pay his mutwalé at the ferry for leave to hire canoes, besides the hire of the ferrymen themselves.

We got across the swift brown stream of the Malagarazi without any disasters, although the canoes were some of the most primitive that I ever saw. The people refused to allow the donkeys to be hauled across until a fetish man had made medicine. Bombay swore that the reason of Stanley's losing a donkey when crossing was his neglecting this precaution.

After crossing the Malagarazi we went along a short way from its northern bank, and first travelling through the salt-producing part of Uvinza, and then through an uninhabited part of the country, we came in sight of the great Lake Tanganyika—sixteen years to the day from the time when it was first discovered by Burton.

When I first saw the lake the day was dull and cloudy, and the lake looked so grey that I thought it was sky, and the distant mountains of Ugoma were clouds. By degrees it dawned on me that this was *the lake*, and nothing else, and then only did its immensity truly realise itself to my mind.

I had sent on a man in advance with letters to Ujiji, to announce our arrival and ask for boats to be sent to the Ruché River, to take us to Kawélé, the capital.

They were duly forthcoming; and on the 22nd I arrived there, being the fifth white man who had ever reached the Tanganika.

Kawélé now is almost entirely an Arab settlement; all the people who trade to the westward having houses there, and wheat, rice, onions, and other good things are cultivated in their gardens. Every morning there is a market from 7.30 to 10.30 A.M., at which fish, meat, tobacco, butter, and all sorts of native produce are sold, and at last we were in a land of plenty, and the hungers and hardships of the road were in a fair way of being forgotten. I, however, thought of

what was to be done, and having secured Livingstone's journals and maps, made preparations for a cruise round the lake, as I had heard that travelling to the westward of it was impracticable in the rainy season.

The Arab traders at Ujiji were most kind and hospitable, though at the same time they made me pay very dearly for everything I had to buy or hire from them.

My preparations for my cruise were completed on the 8th of March, when I left Kawélé with two boats, the *Betsy* and the *Pickle*, to survey the southern end of the lake. This cruise and my other wanderings will be related hereafter.

IN MEMORY OF THE LADY AUGUSTA STANLEY.

BY THE AUTHOR OF "CHRONICLES OF THE SCHÖNBERG-COTTA FAMILY."

"Ye shall indeed drink of the cup that I drink of." "They serve Him day and night."

OH, blessed life of service and of love !
Heart wide as life, deep as life's deepest woe ;
His servants serve Him day and night above,
Thou servedst day and night, we thought, below.

Hands full of blessings lavished far and wide,
Hands tender to bind up hearts wounded sore ;
Stooping quite down earth's lowest needs beside—
Master, like Thee ! we thought, and said no more.

* * * * *

Oh, nerves and heart racked to their utmost strain ;
Hands stretched in helplessness to serve no more ;
Dulled by no slumber to thy deepest pain—
Master, like Thee ! we wept, and said no more.

We o'er all sorrow would have raised thee up,
Crowned with life's choicest blossoms night and morn ;
God made thee drink of His Beloved's cup,
And crowned thee with the Master's crown of thorn.

Looking from thee to Him once wounded sore,
We learned a little more His face to see ;
Then, looking from the cross for us He bore,
To thine, we almost understood for thee !

Till now, again, we gaze on thee above,
Strong and unwearied, serving day and night ;
Oh, blessed life of service and of love !
Master, like Thee, and with Thee, in Thy light !

March 9th, 1876.

B. C.

ON SOME RARÆ AVES.

WHEN the first voyagers who visited the island of Mauritius, about the close of the sixteenth century, began to explore their new-found territory, a certain bird of large size, named the Dodo (*Didus ineptus*), was very abundant on the island. Very curious, as we shall presently see, were the accounts which various travellers of these days gave of this bird; and equally noteworthy is it to remark how, as in many similar instances, the love of exaggeration and the habit of recounting suppositions for veritable facts, tended to make such "travellers' tales" anything but plain and unvarnished.

Visitors to the British Museum will see, in one of the spacious rooms devoted to the illustration of the class of birds, an oil-painting representing a heavy, clumsy-looking bird, which is said to have attained the size of a very large swan, and to have weighed from forty to sixty pounds. Its bill is seen to be remarkably large and strong, and the tip of the upper bill is much arched and hooked, reminding one of the sharp beak of a bird of prey, but more closely resembling the bill of the dodo's nearest living ally, the tooth-billed pigeon, or *Didunculus*, of the Navigators' Islands. The nostrils opened on the sides of the bill, which latter, together with the face, was clothed with a thick naked skin. The great body is rendered all the more awkward in appearance by its being supported on very short, stout legs, which each possess four toes arranged like those of the pigeons, three in front and one behind. The wings were very small, and appear to have been quite rudimentary in their nature, and not at all adapted to serve as organs of flight—a fact which, as will presently be pointed out, had very important bearings on the subsequent fate of their possessor. The wings further bore each a tuft of loose plumes, and the tail was similarly adorned. If we may speculate as to the colours of the plumage, and place some reliance on the accounts given us by its early historians, the general body-colour appears to have been a blackish grey tinted with brown hues; the wings apparently being of a light ashy-brown colour.

Such may be regarded as a brief description of the more prominent features of this little-known bird—a *rara avis* in the most literal sense of the term. By its Portuguese or Dutch discoverers, the dodo was named

the "dodar" and "walgh-vögel;" and the scientific critics of the sixteenth century were at first inclined to regard with much suspicion the "yarns" of the early navigators regarding the curious bird they had seen in the Mauritius woods. Soon, however, the stories regarding the dodo received the most direct kind of confirmation by the production of entire specimens of the bird, but more frequently of detached parts of its frame, such as the head and feet. And meanwhile, artists had been reproducing the features of the dodo; and several paintings, good, bad, and indifferent in nature, remain to afford the modern naturalist some clue to its place in the zoological scale.

Of the entire specimens which were brought to England, one was lodged in the Ashmolean Collection at Oxford; but ignorant of the value of their specimen, the curators allowed it to go to waste, the process of decay sparing only the head and feet. And there exists a report that some worthy Dutch navigator was actually successful in securing a living specimen of the bird, and in exhibiting it in his native town—a spectacle at which we doubt not the honest burghers would open their eyes to their widest extent.

It was exceedingly unlikely that a bird so fair to see and so attractive, both in respect of its plumage and of its flesh, should long remain free from the inroads and persecution of voyagers, to whom the idea of fresh meat, after a course of less savoury fare, would prove most inciting to the chase of these birds. And accordingly, we cannot be surprised to find that, in a comparatively short space of time, the dodo-race, unable to use their short wings in flight, and otherwise helpless against the attacks of man, should have entirely disappeared from the category of existing birds.

The exact date at which the complete extermination of the dodo was effected has not been decisively determined. But we know that in 1625, at least, it was still in existence on the island. For in that year, a certain writer and traveller, Sir Thomas Herbert, visited the Mauritius, and noted amongst other things in his "Some Years' Travels in Africa, Asia, &c." (1677), the existence of the dodo. If we may judge from Sir Thomas's description of the bird, his observations, original or derived, were chiefly gastronomic in character, and had

Fig. 1.—Dodo (*Didus ineptus*).

Fig. 2.—Skeletons and footprints of gigantic birds from recent deposits of New Zealand (after Owen). The right-hand figure represents the leg-bones of *Dinornis giganteus*, the shin-bone measuring over a yard in length. The entire skeleton is as large as those of the elephant. The footprints at the top of the figure represent impressions which have received the name of *Ornithichnites* (*Brontozoum*) *gigas*, from the Connecticut (Triassic) Sandstones.

Fig. 3. Restoration and parts of skeleton of *Archaeopteryx macrura* (Oolitic) after Owen; *a*, Vertebrae of tail; *b*, *c*, and *d*, parts of skeleton; *e*, fore-arm; *f*, terminal free claws of wing.

reference rather to the qualities of its flesh, and to allied features in the economy of the bird, than to its zoological history. He thus tell us that the Dutch call the dodo "walgh-vögel" or "dod eersen." "Her body"—Herbert gallantly speaks of the bird in the feminine—"is round and fat, which occasions the slow pace, or that her corpulencie, and so great, as few of them weigh less than fifty pound: meat it is with some, but better to the eye than stomach, such as only a strong appetite can vanquish." Herbert further and somewhat lugubriously remarks of the general aspect of the dodo, that "It is of a melancholy visage, as sensible of nature's injury in framing so massie a body to be directed by complimental wings, such, indeed, as are unable to hoise her from the ground, serving only to rank her among birds. Her traine"—by which he means the tail—"three small plumes, short and improportionable, her legs suiting to her body, her pounces (claws) sharp, her appetite strong and greedy. Stones and iron," says this old worthy, "are digested; which description," he concludes, "will better be conceived in her representation,"—which latter is forthwith given.

Another account of the dodo comes from Jacob Bontius, and is given in his "*Historia Naturalis et Medica*," (1658). This latter writer troubles himself less with the commonplace aspects of the bird, than Sir Thomas Herbert, and enters more specifically, as became his tastes and culture, into its zoological description. According to Bontius, it is "for bigness, of mean size between an ostrich and a turkey." He maintains that it resembled the African ostriches, "if you consider the rump, quills, and feathers; so that it was like a pigmy among them if you regard the shortness of its legs."

Bontius applies stronger epithets than Herbert to the head and look of the dodo, when he terms it "ill-favoured." Its bill was bluish-white; its body he describes as "fat and round, and covered with soft grey feathers after the manner of an ostrich's." Its legs were coloured yellow; and the claws were strong and black. And this naturalist appears to have been acute enough to have discerned, that from its being a "slow-paced and stupid bird," it would easily become "a prey to the fowlers." Its capabilities of affording a hearty meal to hungry navigators are estimated in plain language by Bontius, when he tells us that "the flesh, especially of the breast, is fat, esculent, and so copious,

that three or four dodos will sometime suffice to fill one hundred seamen's bellies." And he gives us a clue to the cause of extermination of these birds, when he casually mentions, that, like the fowls of modern days, "if they be old, or not well boiled, they are of difficult concoction (digestion?), and are salted and stored up for provision of victual." He also alludes to the fact, mentioned by Herbert, that "stones of an ash colour, of divers figures and magnitudes," are found in their stomachs; and to dispel any erroneous ideas which might exist as to the origin of these stones, he wisely adds that these stones are "not bred there, as the common people and seamen fancy, but swallowed by the bird."

Such is the history, furnished us by its contemporaries, of a bird-form, once, apparently, of plentiful occurrence in Mauritius, but which has for two centuries been unknown to zoologists. And the interest with which the dodo is regarded as a true *rara avis*, is no doubt due to the fact of its singular structure and doubtful affinities to existing birds, as well as to the manner in which it has been exterminated, by the inroad upon its native haunts, of adventurous, unsparing humanity. Most naturalists are now agreed in referring this great bird to the pigeon-group; the discovery of the tooth-billed pigeon already alluded to, bringing to light a form, connecting, as by an appropriate link, existing pigeons with their unwieldy and ill-fated dodo-relative.

An equally interesting example of a bird which has become completely extinct within the historical period, and in all likelihood through human agency, is that of the little *Pezophaps* or Solitaire, which certainly within the last three centuries was to be found in plenty in the little island of Rodriguez, lying to the east of Mauritius. By some naturalists, the solitaire was accounted a kind of dodo, and was ranked by them as a species of that genus under the name of *Didus solitarius*. Probably the best account extant of the solitaire, is that given by a French traveller, Leguat by name, who also gives an account of the dodo, and whose national gallantry is conspicuous throughout his entire account of these birds. He says the solitaire was so named from the fact, that "it is very seldom seen in company, though there are abundance of them." The feet and beak, Leguat mentions, resemble those of a turkey, but are "a little more crooked. They have scarce any tail," he continues, "but their hinder part covered

with feathers is roundish, like the crupper of a horse; they are taller than the turkeys. Their neck is straight; . . . its eye is black and lively, and its head without comb or cap. They never fly, their wings are too little to support the weight of their bodies; they serve only to beat themselves, and to flutter when they call one another."

An important statement as regards the cause of the extermination of the solitaires is made by Leguat, when he says that "'tis very hard to catch it in the woods, but easie in open places, because we run faster than they, and sometimes we approach them without much trouble. From March to September," we are further informed, they are in good condition, being then "extremely fat," and tasting "admirably well, especially while they are young." Then follows our traveller's description of the beauty of the solitaires; and it is naturally in this part of his discourse that he allows his special proclivities in the way of gallantry to crop out. "The females," he says, "are wonderfully beautiful, some fair, some brown. I call them fair, because they are the colour of fair hair. . . . No one feather is straggling from the other all over their bodies, they being very careful to adjust themselves, and make them all even with their beaks. They have two risings on their craws (neck), and the feathers are whiter there than the rest, which livelyly represents the fine neck of a beautiful woman. They walk," he concludes, "with so much stateliness and good grace, that one cannot help admiring and loving them, by which means their fine mien often saves their lives." Surely no bird was ever apostrophized in higher terms than the solitaire, although, even as zoologists, we may be tempted to wish that the last words we have quoted from Leguat had proved truer and more effectual in the preservation of the hapless solitaires.

Thus, like the Dodo, the solitaire owes its extinction to its abortive wings, and to the visits of man to its domain; whilst a remarkable feature in the cases just noted, is the fact of two species of wingless birds on these detached and isolated island-homes.

Passing backwards from the sphere of the zoological antiquary to that of the geologist, we find the category of the latter to furnish interesting additions to the list of anomalous bird-forms. Birds have always formed interesting objects of consideration to the geologist, for the reason that they but rarely occur as fossils, this result being presumably due to the fact, that their free habits

preclude the probability of their frequent entombment in soft deposits, as a preliminary stage to the petrification and fossilisation of their remains; whilst, also, the fossil remains of such birds as have been discovered, interest the geologist from the obvious dissimilarities they present, in many cases, to the structure of their living and existing neighbours.

Some highly curious bird-remains have been found to occur in the most recent or superficial deposits of New Zealand. Chief amongst these remains are those of various species of gigantic wingless birds known to science under the generic name of *Dinornis* (Fig. 2). The imagination of modern zoologists may almost fail in its scientific attempt to reconcile these gigantic bird-forms with their living representatives. Thus the shin-bone of one species of *dinornis*, measures over a yard in length; whilst in another species the toe-bones, as Professor Owen tells us, "almost rival those of the elephant." These giants of the bird-class were further wingless—or rather, like the dodo and solitaires, they had abortive wings, which were utterly useless for flight. In all probability the case of the *Dinornes* presents, as regards the causes of their scarcity, if not of their total extermination, a similarity to that of the dodo. Unable to fly, they must have fallen an easy prey to the natives; and there exists evidence of a very reasonable kind, to show that at no very remote date the Maories hunted these birds for the sake of their feathers and flesh. Thus it is believed to be possible that these birds or their allies may still be in existence in the Middle Island of the New Zealand group; and this latter supposition is rendered the more probable when we reflect that a kind of Coot—the *Notornis*—was first made known to science through the discovery of its fossil remains, and was afterwards found to be still in existence in the Middle Island. New Zealand still possesses a representative of the old wingless birds, in the existing *Apteryx*—the Kiwi-Kiwi of the natives; a curious weird-looking bird, which in some respects forms quite an anomaly in the ornithologist's collection.

Madagascar has also furnished its quota of curious bird-fossils, in the remains of the *Epiornis*, a bird which was probably as large as the New Zealand giant. The eggs of this latter form have been met with in a fossil condition; and we may imagine that old Bontius would have delighted to have chronicled the number of hungry mariners who could have supped to

repletion off a single egg of the æpiornis. For we are told that each egg measures from thirteen to fourteen inches in its long diameter; whilst its contents are estimated to have equalled in amount those of three or more ostrich eggs, or of one hundred and forty-eight ordinary hens' eggs!

When, therefore, we find that in certain sandstones of America the three-toed footprints (Fig. 2)—measuring each some twenty-two inches in length—of some huge biped are met with, it becomes easy to account for the presence of these literal “footprints on the sands of time” by the supposition of their having been made by some huge bird-form, analogous, in respect of its size, to the diornis and its allies. These footprints measure about four times the size of those of the African ostrich.

As every one knows, no living bird has teeth; although the horny edges of the bill may sometimes be toothed or cut into tooth-like projections. But recently the fossil remains of birds have been met with in this country, and also in America, in which regular bony processes analogous to teeth were developed along the edges of the jaws.

Perhaps the most marked and singular specimen of this kind, is one obtained from a deposit of recent age known to geologists as the London Clay, and described by Professor Owen under the name of *Odontopteryx*. The fossil consists of a large portion of the skull; and, whilst the bird-characters of the remains are perfectly apparent, so far as their form and structure are concerned, they yet present a wholly unusual and remarkable character, unknown in any living bird, in the presence of a series of tooth-like processes developed on the borders of both upper and lower jaws. The processes, under microscopic investigation, however, have not yielded evidence of their claim to be regarded as true teeth, which in their structure are essentially different from bones. They are rather to be viewed as mere tooth-like projections of the jaws, and in the living bird were most probably covered, as with sheaths, by horny investments derived from the natural covering of the beak.

It becomes an interesting study to compare such a fragment as that briefly described, with existing birds, for the purpose of ascertaining its nearest affinities and relationships. Thus, although, as already remarked, no living bird can vie with this ancient neighbour in the actual possession of a tooth-like armament, we may find somewhat analogous structures to be represented in

some existing members of the class. Thus, the nearest ally of the dodo, the tooth-billed pigeon or *Didunculus*, possesses three pointed processes of horny nature in the sheath of the lower jaw, whilst the extremity of the upper bill is hooked. The falcons and other birds of prey have a “tooth,” as the horny process is termed, on each side of the upper bill; and the shrikes and their neighbours exhibit a like arrangement of the horny margin of the beak. Perhaps, also, nearer analogies to the case of the fossil from the London clay, may be found in the curious armature of the bill of our familiar ducks, geese, and their allies, in which the edges of the beak are notched, or divided, so as to form a series of transverse horny ridges; whilst in the goosanders and mergansers these ridges are larger, sharper, and altogether more tooth-like than in the ducks. The function of these ridges is undoubtedly that of sifting or straining off the mud in which these birds find their food, but in the goosanders, their obvious use is that of retaining a firm hold of the fishes which form the great bulk of their food. In none of these birds, however, have the horny processes any intimate connection with the jaw-bones, and thus in respect of the horny supports which the “teeth” of the *Odontopteryx* possessed, the latter remain unique and solitary amidst its modern allies. An American bird-fossil, (*Ichthyornis*) from the Cretaceous or Chalk system, may be said to exhibit a still more advanced type of tooth-structure than Professor Owen's specimen; this New World bird having apparently possessed numerous teeth, which resemble true teeth in that they are “implanted in distinct sockets.” Such birds in all probability were web-footed or swimming birds, and in the exercise of their natatory life, were doubtless assisted in the capture of their slippery prey by the peculiar armature of their bills.

Not the least remarkable part of the history of these birds, is that concerning their relationship with Reptiles. Every naturalist knows, that, notwithstanding the strong outward dissimilarity between birds and reptiles, these two groups of animals are very intimately related by many points in their structure and development. And it does not, therefore, surprise us to find in the ancient representatives of birds some nearer approaches to reptilian characters than are exhibited by modern members of the class. Thus the *Odontopteryx* is remarkably like certain extinct flying Reptiles, named Ptero-

dactyles, in the disposition of its teeth; and it may not be uninteresting to remark that the gigantic foot-prints (Fig. 2) already alluded to as occurring in certain American sandstones, are by some geologists referred to large bird-like Reptiles, which possibly may have possessed the power of walking upon two legs.

As a last specimen of oddities in bird-life, we may cite the singular fossil-bird known to us by the discovery of a single specimen only, and named the Archæopteryx (Fig. 3), or "Ancient Feather-wing." This fossil was discovered in certain slate deposits occurring at Solenhofen in Bavaria, which belong to the rocks known as the Upper Oolites; and its structure presents several features of most anomalous kind. Thus it had a long lizard-like tail, composed of distinct vertebrae, each bone having carried a pair of quill-feathers. No other bird, either living or extinct, possesses such a conformation of the

tail; all other birds having short tails terminated in every case by a "ploughshare-bone," into which the tail-feathers are set. Then, also, this strange bird, which must have attained the size of a crow, had two claws external to the wing—structures also unrepresented in any other bird. Certain other features in its structure are equally anomalous; and had the entire skeleton been preserved—for the remains are but fragmentary—its relationship with the Reptiles, evident as that relationship is, would have been more clearly demonstrated. It is curious in every sense to contemplate such a form as the archæopteryx. But in no respect should the entire history of these fossil birds more strongly excite our interest, than by the consideration of the scientific circumstances and details through which we are enabled thus to gain a tolerably complete idea of how bird-life was represented in very ancient epochs of our world's history.

ANDREW WILSON.

HIS DEAD.

HE laid the ferns about her feet,
And two white lilies in her hands,
With "Fare you well, my lady sweet,
I cannot speak; God understands."

Then to the empty East he fled
(Alas! there was no cross to bear);
He asked but to forget his dead,
And Memory mocked him in his prayer.

He hurried to the clamorous West,
Where nothing is remembered long.
She died afresh in work, in rest,
In speech, in silence, and in song.

The fatal North, the lingering South,
Like answer to his quest did give.
Then heard he from an angel's mouth—
"Live with thy dead, and she shall live!"

He let no meaner love intrude,
He shut him from the world away;
Oppressed by that soft solitude,
She died more deeply every day.

He cried aloud, "O angel-word!
Can it be true that thou hast lied?"
The answer smote him like a sword—
"I bade thee live, but thou hast died."

Then he took heart, and filled his days
With love of men, and laboured hard,
Made toil his prayer, and tears his praise,
And took no thought for his reward.

At last she shone into his eyes
No angel—his familiar wife.
"Can this be death?" amazed, he cries.
"Nay, love," she answered, "this is Life."

M. B. SMEDLEY.

[The Editor regrets that in the article on Bishop Wilson, which appeared in the March number, there was a statement calculated to give pain to the estimable publishers, Messrs. Seeley and Co. The writer, Sir John Kaye, had adopted the statement in question from an essay published many years ago in "Ecclesiastical Studies," by Sir James Stephen, and which does not seem to have been contradicted at the time.—ED. G. W.]

With-
in one
hour of
separa-

ting from Joel Wray, he burst into his sister Lizzie's workroom.

"Hey, Liz! put by them rags!" he cried, rushing in, as Lizzie, by the aid of her tallow-candle, was collecting her snips and patches after having laid aside her seam with the waning light.

"Have a care, bor. You be treadin' on Lyddy Coram's new gown tail, and your feet be out on the wussest puddles, it's like," protested Lizzie.

"Lyddy Coram's gown tail be hanged," said Clem, in a strange fit of insubordination. "I say, Liz, you'll soon 'a toggery enow to stitch at. I 'a heerd sich news as will make all Saxford ring. Your frien' Madam—wool, her d' be as good as married to Joel Wray."

"You be'n't meanin' on it, Clem," said Lizzie, her small, pale face becoming painfully red, and then whiter than before. "You d' be funnin' a bit, and it d' be main silly kind on funnin' for a big lad like you, a-startin' me, and a-makin' my heart jump like a toad i' hole."

"But it be right down truth and gospel, Liz. Joel Wray, he as good as owned it to me this wery night. He were that happy he couldn't sit lone, he 'ould 'a

bustet. He mun 'a music like kings in Bible, so he sen's for me. He sen's to the Brown Cow, where he sits hisself, leastways there was nobry else but Jenny Woods, and news come out in music."

Liz still refused to believe the astonishing tidings.

"Pleasance 'ould never be so far left to herself as to prefer a whippersnapper waga-bond lad like yon," she cried, springing back to her original opinion of Joel Wray, "never never."

"Tut, Liz! every mawther ain't love sick about 'Merican giants," said Clem, without meaning to be unkind in his jeer, "and at the least as is thought on him, Joel Wray d' be a wery smart young town chap, as all the gals in the place 'cept you, what grovels—and gets no thanks for it—at owd Dick's feet, 'ud give their ears for."

"Lor 'a mussy, what will Dick do if so be you speak true? You 'ould never go for to deceive me when you see I do take it so to heart," urged Lizzie, wringing her hands at the thought of Long Dick's desolation, and yet in the midst of her staunch fidelity feeling the faintest flutter of personal hope awake and stir in her heart.

"Mor, you may get him yoursen yet," said Clem, "if so be he don't take to drinkin' like a fish, and fallin' into a ditch or summat. You 'ummen d' be sich fools," he went on, thrusting his hands into his pockets with an air of pitying superiority, "to think any man-jack alive sich a precious prize."

"Say it again, like a lad," said Lizzie, soft and low, her little wan face appearing to become all eyes, "—that I may get him yet! You be the fust as has said it, and it do sound kinder lucky, it do. Say it again, Clem, and I'll be owin' you summat, whatever you sets your heart on as I can get for you."

"You be fair crazy about Long Dick," said Clem, impatiently dismissing the endless subject, "and it weren't him I came to speak about. It were Joel Wray as I were a thinkin' and a wantin' to tell you on."

"And whatten is there in Joel Wray, if you please, as is so worthy of bein' spoke on?" asked Lizzie.

"There's a heap in Joel Wray," replied Clem promptly. "Hearken till me; he 'a promised to len' me money to go to music-

school in Lunnun. Now, what do 'ee think on that?" asked Clem triumphantly.

"I just think that Joel Wray d' be one on the biggest braggers out, and he'll bring poor misguided Pleasance to sorrer, sure's fate," said Liz disdainfully. "Where be he to get money to len' you? he as is no better'n a day's-man, and a-marryin' on Pleasance on her tidy bit money, if so be he d' be marryin' on she? I won'er you can be sich a gander, Clem, as to be led by the beak by a rogue. Por! he mun be a rubber in disguise if he 'a a shillin' to len' you."

"Not a rubber, Liz. St! st! lass," he said, as if to warn breathlessly an offending dog. "What 'ould you say to a gen'lman, a lor' like, in disguise?"

"A lor' a day's-man! a lor', Joel Wray, as 'a wrought the 'arvest, and lodged with Phillis Plum, and rowed with me in t' boat on t' Broad! who do be mad now, Clem?"

"St! st! I tell 'ee, Liz; it do be a dead secret," said the boy, in his excitement sitting down on the table, both him and Lizzie so engrossed that they forgot how many boddices and sleeves he crushed by his weight. "I 'a heerd and seed summat as I never put together till this night. What do Ned up at t' Manor call Joel ahind his back, for nickname, but 'gen'lman Joel?"

"That d' be little to go on," said Lizzie.

"But why do Ned give Joel that 'ere name?" went on Clem, with the pertinacity of a slow mind which, having caught an idea, will not let it drop; "because Ned, he says Joel be 'nation nice in some things, though he d' be easy goin' enough in others; and owd Phillis, she says he be 'nation nice in some things, she says. He mun wash arter's work, face and hands and all, be it noon or night; and he d' have a brush for 's teeth as well as a brush for 's hair, in a case sich as Madam bought at Cheam, and gev you for your needles and scissors and tapes and buttons and that," explained Clem, looking round at the objects specified.

"A brush for 's teeth, think on thatten! Wool, it do sound summat," admitted Lizzie. "I 'a heerd tell that all gentlefolks d' go a brussin' away on their teeth every live day, though it d' soun' nonsense waste on time. I 'a seed Pleasance a-doin' on it, when I were bidin' the night at the farm, and her said, in excuse like, her 'ad learnt when she were young, and were at a boardin'-school a-bringin' up for a lady. It were like an ill lesson her could not leave off and feel comfortable athout. But he d' be the impidentist dand, yon Joel Wray, as ever

breathed, though he d' be a brave lad likewise, I ain't denyin' on it," she owned, in a lower tone, recollecting all at once the obligation she had lain under to Joel Wray's bravery, and softening a little under the recollection. "He may 'a brush for 's teeth, just because it d' be heady and uppish. Arter all, it d' be but a small mark that he is a lor', a black spankin' little chap like he."

"But lor's do not go by lumps, and I 'a not heerd that they were rairer than their neighbours. Look yer how he lived on at Cheam," Clem continued to deliver his testimony, not sensibly shaken by Lizzie's doubts, "and he were not livin' with owd Granny; he were allers puttin' up at Ship A-hoy, as it charge for wittles and bed were aneath his countin'. There was word goin' that summat were torked out by somebody for the better beryin' on them drowned furrin' sailors when he walked at the ber'al. Folk were astin' how did he get the rock-yets when Long Dick failed, and whatten queer customer for a for'ard day's-man and labourer were he. Were it a wayger, or what? He did not quit the town too soon, for it were gettin' too hot for he."

"And what for did'n'tee tell us all these wonderful stories when you come from Cheam afore en?" inquired Lizzie, suspiciously.

"It were none on my business," said Clem, stoutly. "I were full on a new variation on the 'armonious Blacksmith—to think that there d' be sich a tune with sich a name, as if it were made for me!—as I 'ad got paper and line and bar for, and as I 'ad bought and paid for, off my odd 'arvest earnin's. I 'ad no time to spare for idle mawther stories, until t' night when Joel Wray he sought me out, he did, and spoke on the music school, and his friend as 'ad a word to say in it."

"Wool, it 'ould be a rare tale an it were true," said Lizzie, cautiously, yet drawing a long breath as if she were at last taking it in with the dear delight of women of all ranks in a romantic mystery. "It 'ould make a great differ to Long Dick, for Pleasance she d' be gentle born and bred, a kind on stook lady; and it stands to nature, her half belongs to gentle folks, and if sich come arter her in the guise on day's-man, or cow-man, or that-ten, he d' be bound to win her—a common man, be he far besser'n t' other 'ould never 'a no chance in that case. But I take it oonkind in Pleasance," added Lizzie, after a moment's thought, "never to 'a breathed a word on her secret to me."

"Mind, Liz, it d' be a dead secret as I 'a

telled 'ee, and you are not to go for to gabble it to Pleasance nor nobry," urged Clem.

"I'll not go near Pleasance to speak to she on what she 'a not thought fit to speak to me on," said Lizzie, taking her stand on the dignity of friendship and believing in an offence committed.

"Nor to nobry," Clem reiterated, making assurance doubly sure; "you and me 'a been jolly thick together along on not sailin' in the same boat with the rest. But we'll not be thick—not no more, Liz; nor will I give you another secret if you go a tellin' tales and chatterin' on what may cost me my guv'nor's favour and a rise in life."

Lizzie extended her promise reluctantly—and not without being guilty of a mental reservation in favour of Long Dick.

CHAPTER XXV.—LONG DICK GOES LIKE A MAN.—LIZZIE FOLLOWS LIKE A SQUAW OR A DOG.

THE ordeal which Pleasance dreaded, yet which she was fain to wish, sighingly, were over, was at hand.

Long Dick had been apprised by Mrs. Balls that the die was cast—he had lost Pleasance. There was nothing remaining for him but to have it out with Pleasance—to speak his mind to her, and then—why then, the deluge! He should turn his back for ever on Saxtord and Manor farm. He did not care what became of him afterwards.

There had been a great clothes washing at the Manor house. The linen had been spread out to dry on one of the neighbouring hedges. The day had been fair, with both sun and wind, and the drying process had been successful. Pleasance was removing the clothes, fresh, stiff, and white, in a basket, when Long Dick seized his opportunity. Leaving his plough in a furrow and his friends the horses to take care of themselves, he came up in the honest afternoon light to say his say and take his leave of Pleasance.

She saw him coming, detected the black cloud on his face, and her heart fell, so that she nearly dropped her basket and its contents on the earth.

"Pleasance," he said, gloomily, "I could not speak up for mysen from the fust, and there is less need on speakin' now. I 'a nowt to ask, nowt to complain on like a babby, for if I cannot fight, I wunno make a moan. I knowed what were comin' from the fust. I 'ould 'a helped it an I could, but I couldn't, and so there's nor'n left for me but to go, as it's all over with me."

"Don't say that, Dick," implored Pleasance, "you've no great loss."

"I 'a lost my gal, though it's the fust time I 'a plucked up spirit to call her that. Sombry else 'a gone boldly in where I stood, on t' door step, in the cowl outside. But, dang it, if I 'ad to do it again it 'ould be just the same thing, so it d' seem 'appiness were not for me."

"Dear Dick! old friend," said Pleasance, "don't take on so. Only have patience, and you will find some other girl of whom you are worthy, who will be more like you, and make you far happier than ever I could have done."

"No, you 'ont make that out though you speak till doomsday," said Dick, doggedly, "and though you cosset me ever so: 'ummen 'a cossetin' ways when they means least by en," he observed a little bitterly; "but I dunno blame en, it bein' their nature as it is on colts to skit. There's nowt but to go. I 'a not opened my mouth afore, and I'll not open it now on'y to bid you a long farewell."

"But must you go, Dick?" entreated Pleasance, sorrowfully, "from your horses, and fields, and people, where you are doing so well? Indeed, I did not mean to deceive you."

"Nobry's a sayin' you deceived," said Dick, a little irritably, "an't I said I stood back and let another walk in, and I can't blame 'ee? I 'ould rather suffer it twice over than 'a you 'fled by dirt cast at you—you as I 'a held a hangel. Wool, wool, it's but me as is felled, and I'm a hox on a feller as can stand a blow or tew," and Dick laughed a sore laugh.

"We might be friends still," said Pleasance longingly, "when you and he are friends already."

"Oh! dang him and his friendship," said Dick savagely.

"Dick!" cried Pleasance, becoming on the instant severe, "I did not think that you would speak like this—to me of all people. Remember it is not his fault that you cared for me first. Remember how he saved your life."

"Give me patience," groaned Dick, "as if I were like to forget thatten! and small thanks to him for it; he 'ad a deal better knocked me on t' head at oncet, than saved my life and took my sweetheart. What do life be worth ahtout my sweetheart?"

"Oh, Dick, you think too much of a sweetheart," remonstrated Pleasance.

"Do I? Then what 'ould you say to me if I took yourn, though I saved your life into the bargain?" he retorted with a sneer.

"Dick, Dick, don't speak like that!" said Pleasance, paling a little; "but nothing you say will make me mistake or mistrust you."

"You're right there, Pleasance," said the giant, more gently, if with a heavy sigh, "an't I said—not oncet, but over and over, that I be'nt complainin' like a babby, nor blamin' nobry in petickler—not even an owd stoopid oaf with the strength of a hox and the wit of a hen, and no more pluck nor a sheep or hare—though yon chap comed here and comed atween you and me. Dunno deny it," he cried again; "you cannot deny it, Pleasance, that if sich a hoily-tongued, rovin' blade, with his head stuffed with know on the town and book know, as carried off his sarce, 'adn't been to the fore, and stepped in, and winged my bird in a jiffy, I 'ad a chance. It might 'a been poor, but still it was a chance as I 'ould 'a give all I 'ad to preserve, as I 'ould give my life to fetch back an it might be."

"I don't deny what might have been," she said, gravely, looking down; "I did—I do think kindly of you, and I value, as I have always valued, your kindness for me. But, Dick, I must say it, you could not have been to me—and it is no fault to you to own it—what he is; and although you and I had tried to do our best by each other, still there could not have been great happiness between a couple not fairly mated. We might have found that out too late; oh! Dick, don't grudge that we have found it out in time."

"I do groodge, I mun groodge you and my shadder on 'appiness to my dyin' day," said Dick, with an odd mixture of passion and tenderness; "but I 'ont pay it back on him, I 'ont, for your sake, or, for that matter, for hisn. I ain't denyin' he were above-board from the fust moment that he were a makin' up to you. Set'en up! a stook mechanic! a day's-man! He's a bit light o' the head he is, with all his know, and he d' want ballast, that is the wuss'n I knows on en. But he's been in luck, and a 'umman like you may 'old him straight. I ain't castin' dirt at he, nudder, because he's your choice. 'Leave her free,' says he; and I 'a left you free, an't I, Pleasance?"

"Yes, you have, Dick, you have behaved like a man; ah! don't spoil it all now."

"Wool, it is just not to spile it that I goes my way. I be'nt oonreasonable, Pleasance, no more'n peevish, but do'ee or do he think I can stay on here and see my lot in his lap, and mine as empy as an owd ha'nted 'ouse, as'll never more be

occypied, never? I could not bide it, Pleasance, I tell'ee plain I 'ould make a beast on myself and go to the dawgs at your door, as 'ould cost you pain to see. And some night when t' drink were in and t' sense out, I 'ould lay wiolet hands on him—as I 'ould not harm, not knowin' it this day, along on his bein' your choice, let alone his pullin' me out on t' Broad, though what were that for a favour when I wish I were lyin' with owd Punch I do, this minent? But I might knock the breath out on him, he's none so big, though he d' be cocky, and commit murder and swing for en, and break your heart, afore I could stop. No, I'll leave the coast clear for he, and Bailiff may take a fancy to he, as others that I thought wiser'n Bailiff 'a took a fancy. I'll go out ou your sight and hearin'; I'll put land and sea atween me and Joel Wray, long afore the day that he can call you 'is wife."

She saw the necessity at last, and appreciated his motives as she did so. "Then go, Dick, if it be better for us all; go for a time, and God bless you. But you can never go out of sight and hearing. We shall seek tidings of you, even if you do not send them to us. You will send word to Lizzie, who is more than a sister to you. You will not be able to help it."

He let himself be touched by her appeal. "Ay, poor Liz, to care for me so much when I could give her so little; but there is a pair on us. She will miss me, and so may Diamon' and Dobbin there," pointing to the plough-horses, "poor owd chaps, with another driver as don't know their ways, though he may be that clever and all the luck hisn—and Applethorpe and Hornie as I 'a reared from calves—and Daisy as I brought out on her dwinin'—and Jowler and Tyke—and the wery cocks and hens and pigeons, as knowed my voice, and came flockin' to me when you wasn't about, to be fed. But they are on'y dumb beasteses, and will soon take up with another keeper as 'a a more winnin' way with en, besides."

"More will miss you, Dick, who will not forget," said Pleasance in tears. "It is you who will forget that you ever felt forced to leave us, and to go away to the ends of the earth; and you will come back after awhile, and we shall be very glad to see you."

He looked wistfully at her, shook his head, and turned on his heel.

Joel would fain have begged Dick's pardon, and sought to comfort him, and to part friends. But Dick shunned Joel

to the last moment, when breaking terms, forfeiting his wages, and running the risk of being stopped and prosecuted for breach of engagement, he left within a day's time of his leave-taking of Pleasance.

Pleasance saw him go (for the road from the village to the next railway station was that which passed the Manor-house), carrying in a bundle what he meant to take with him on the tramp, having literally changed places with his fortunate rival.

He walked along without looking behind him or to right or left, not even to the Manor-house which he was passing close. He held on as if the furies were behind him. Mrs. Balls covered her head with her apron and filled the air with lamentations and pettish reproaches; but Pleasance stood silent just behind the window-curtain in order to take her last look of Long Dick.

Here heart was sore, and yet she thought within the moment of Joel Wray, and felt thankful that he was engaged at the opposite extremity of the farm, and so was spared the sorry sight.

But there was somebody who did more than look out at the fugitive from behind a curtain and bewail a hard necessity; somebody who could spare no thought from him even for herself.

On this hazy autumn morning a little crowd of familiar faces had gathered in the village street—notably at the doors of the Brown Cow and the smithy, where Dick's youth had been reared among his kindred, to watch his departure.

These spectators easily guessed the cause of Dick's sudden abandonment of his post and his friends, and by no means showed the sufferer's forbearance in refraining from blame and from murmurs. Possessed by the scene before them, they gave vent to the violent humour of a mob in loudly accusing Joel Wray and Pleasance of being interlopers—the one a smooth-faced traitor, and the other a double-dyed jilt.

From these abusive groups Lizzie Blennerhasset emerged, half running, half limping after Dick, no one hindering her, not even her father and mother. They stood with the rest to see the end. They not only treated her love-sickness as a real and desperate disease, they acted in regard to it with somewhat of the spirit in which eastern nations deal with madness, "Let the poor mawther see the last on him, it d' be her due." "Happen, he'll turn and give she another word to keep her poor heart, as 'a been set on en, sin he drew her out

on the burnin' smithy when her were a chile. Happen she'll bring him round yet, and get him to give over leavin' his good place and his frien's and goin' off like a listed sojer; all for a proud spec'acled jade as 'ouldn't know her own mind, but 'a took up with a idle stranger which she'll sup sorrow for, and no mistake." "Lor, how the sperit d' carry Liz's lame foot! she be gainin' on he like t' wind."

Like a squaw or a dog, poor Lizzie Blennerhasset followed Long Dick. Her eyes were blind with weeping; her yellow hair was pushed back from her face, pulled about her ears, and hanging down in elf-locks. In the disorder of extreme grief, her trim gown was as untidily put on as any slovenly field-worker's, and the skirt was dragging in the muddy road. She could hardly have told why she followed her cousin, or whether she had the least hope in doing so. She had already been repulsed by him more than once that morning, in a desperate attempt to break her faith with Clem, and tell their secret, which, if it had any truth in it, might lighten Dick's burden, by making it less galling to the man's vanity and pride.

Dick would not listen to her, or heed her. He treated her words as the wildest tale, put off upon him to hoodwink and disarm him. It even enraged him against Lizzie herself, so that he broke off from her in hot anger, charging her with being in a plot against him, to mock and cheat him.

This was the crowning blow that had sent Lizzie as far beside herself as he was driven desperate. This was the last straw that had broken the long-suffering camel's back. She could not let him go from her thus. She must pursue him, though he should only stay to spurn her as a man will spurn the troublesome, importunate fondness of a dog. She did not mind what people might say; she hardly heeded what he said at last. He was her sun, and she could not let it go down and leave dark night behind, without a dying struggle to keep still in its bright beams.

Lizzie overtook Dick, or rather he heard her voice crying after him, and obeying reluctantly an old obligation, even in his baneful excitement, he slackened his pace till she came up to him, just at the corner where the road was about to lose sight of the yellow gables and thatch roof of the Manor.

"Hallo! Liz," he feigned astonishment, "what be you arter? What brings you so far afield?—you as hobbles like a cow as has her best front leg tied to her head to

stop her from flingin'?" And he laughed at his comparison.

"Oh yes, Dick, I d' be too cripple to run. It mun 'a been just funny to see me. But I 'a made you laugh, lad—that were one good turn," panted Lizzie, creeping up to him, and looking through her sobs and tears with a faint smile in his face, like a squaw who snatches at a chance of laying the hair of her head beneath the feet of her insolent brave, if that will propitiate him; like a dog when it ventures to wag its tail at the shadow of a sign of grace in the master who is bent on its punishment.

"Go back this minent, Liz," shouted Dick, maddened afresh by the thought of his failure. "Do'ee mean to make me a gazin' stock as well as a laughin' stock to—thee knows who I mean, Liz—go back when I bid 'ee, or thee may tempt me to lift my hand, and strike 'ee, as are but a frail thing, even for a gal. Leave me alone, Liz."

"Dick, dear Dick," moaned Lizzie, still holding by him, "dunno leave me; strike me,—where be the odds? when I cannot live athout you. I'll die if you go. Oh! why should 'ee go for she, Dick, and not stay for me?"

That was a question far beyond Dick's philosophy. All his answer was to drag asunder Lizzie Blennerhasset's arms from clasping him, push her from him, and clearing the hedge at a bound, run across the misty fields to the station.

Lizzie sank on the road, where Pleasance ran out to lift her up. But Lizzie put out her hands, to keep Pleasance off from her, and accused her on the spot—her eyes wild and blazing like Dick's—with being his destroyer.

"You are a false, cruel woman, Pleasance Hatton. You 'a a heart as hard as the nether millstone, and you 'a a light head to match your hard heart. You mun go colloquin' with tew lads; and you 'a ruined the best on 'em, the best in the country, and cost me the on'y creature I cared for—him as drew me out on the fire; and I never wish to see your face or speak to you again."

Pleasance drew back in sharp pain, while Lizzie gathered herself up, rejecting all aid, and toiled slowly back to take to her bed, and lie for many a day with her face turned to the wall.

CHAPTER XXVI.—THE DAYS BEFORE THE MARRIAGE.

PLEASANCE had got over the trial of Long Dick's taking her proposed marriage so

much to heart; for word came that he had taken the first opportunity of sailing from Cheam, and had worked his passage out in a ship bound for America.

But why should Pleasance not get over it, when she was young and hopeful? A change of place might even bring a change of mind to Long Dick. When even Mrs. Balls had accepted the situation, and was so far reconciled to it and to Joel Wray, that though she continued shy of him, she was indemnifying herself for the overthrow of her plans by being full of the preparations for her young cousin's marriage—anyhow—to some man—if not to the right man? Mrs. Balls had grown so complacent that she had agreed—Lawyer Lockwood not forbidding the arrangement—that the young couple should find quarters with her in the ample space of the Manor-house where she was still permitted to preside, instead of her going with them to a house in the village.

Mrs. Balls knew it was only a respite, that her work was all but done, and that as Joel, however smart, could never fill Long Dick's place, so his wife would not be chosen as Mrs. Balls's successor. It was a far less "comfable" settlement than Mrs. Balls had proposed. But even a respite was grateful to the aging woman, who had begun to cease to look forward beyond the next winter or the next summer; and in the meantime she had the glory of knowing that her cousin was soon to be a bride, and of taking the liveliest interest in all the small purchases.

Speak of a bride's pride in her adornment for the great event of her life! Surely it is far exceeded by the pride of an elderly kinswoman, who has never been a bride herself, but who takes her triumph vicariously, and at her ease.

Not merely Mrs. Balls had thawed; the village of Saxford had come round again to be in high good humour with the two who remained master and mistress of the field. It was not simply that all crowds are fickle, and more or less time-serving. The Saxford population was not so much base as childish. It was that Long Dick, and the sorry spectacle which he had presented when he had withdrawn worsted before his enemies, were out of sight and sound; and in their room, filling the vacant village mind, was the goodly spectacle of Joel Wray and Madam about to celebrate that great festival of life, a wedding for love, a wedding that had not been long a-doing, that had been made up in the midst of the villagers, and before their very eyes as it

were, in the brief weeks which intervene between the harvest and the fall.

In this wedding, Pleasance—with regard to whom the natives had shown themselves apt to nourish a rankling suspicion—was appearing a very woman, as headstrong and rash in throwing away herself and her goods, on the impulse of the moment, on a pleasant-tongued stranger, as any Polly, or Car, or Sally among them could have done. And even as one touch of nature makes the whole world kin, so the people loved Madam the better because of the fellow-feeling bred of her fallibility.

One or two inveterate growlers, mostly old village inhabitants, to whom the young giant, Long Dick, and his prowess had seemed to belong, and to lend a source of boasting over Applethorpe and other neighbouring villages, would stand a little aloof and mutter about new-fangled people and new-fangled ways; but young Saxford, headed by Clem Blennerhasset, was, to a man and a woman, for the present at least, zealous adherents of Joel and Pleasance. Only Lizzie Blennerhasset lay on her bed, with her face turned to the wall, unable to eat or drink.

Pleasance, without being altogether aware of the amount of condemnation which she had previously incurred, was willing to take the compensation, and pleased to be in harmony with her world. She was too sympathetic not to crave for sympathy, however imperfect, in others; and she had an intuitive perception that Joel Wray was like her in this as in many respects, that if he would not be turned from a purpose by opposition, he would look wistfully after averted, hostile faces, and would droop a little in his gladness, because of his fellows' cold dislike.

But these were merely outside matters, the husks of the happiness, the rich essence of which lay safely stored in its kernel, in this heyday of Pleasance's life. After all, she would not have cared so very much more for the revived rudeness of the Saxford villagers, than she cared for the unlucky chance, that her marriage, in place of happening in midsummer, was to occur in chill October.

Instead of the east country looking its best, it was looking its bleakest. The dank white mists rising from its own abundance of Broads, rivers, and ditches, hung over it morning and evening. Every flower was either withered or bleached into a frosted, perishing bloom. The very reeds and rushes were utterly sere and falling crushed and broken at the slightest touch. The cattle and horses were disappearing from the pas-

tures. The wild foreign birds—tokens of the coming reign of ice and snow in northern regions—were arriving in flocks at Saxford Broad. The last remnant of the lingering autumn gales, bitter and briny on the east coast, brought with it white and grey curlews scudding and flying low before the blast, settling in innumerable white flecks and patches on the pasture and the ploughed land, and adding, in the storm-omen which they presented, to the cheerless aspect of the scene.

Pleasance would have liked, if she could have taken her choice, to be married when the year was young, when flowers were rife, when the days were long enough for her happiness, and when they closed in such widespread sunset glory as transformed and irradiated the common earth.

But it was a small loss, and Joel shared it with her, nay, improved it by teaching her still better what she knew already of the beauties which are to be found at all seasons. Not to speak of the wild windy grandeur of some of the dark days—there were the exquisite cobweb grace of dewy gossamers hung over grass and hedge-row—the delicate neutral tints of earth and sky when they are at their palest—the silvery light cast by low sunbeams on pollard willows, and on the rank grass by water-courses—and the sweetness of the robin's song when it alone breaks the stillness. Joel returning from his work under the new head man whom the bailiff had put in Long Dick's place, brought Pleasance splendid trailing wreaths of briony with their brilliant berries, late clusters of blackberries, and specimens of fungi that half redeemed their poisonous qualities by their marvellous hues of crimson, gold, straw-colour, and ashen grey.

"Rubbishing wares," Mrs. Balls called these offerings; but it was well, she allowed, since matters had taken the turn and gone the length they had, that Pleasance could please herself with "sich dirt."

And Pleasance did please herself. She named the dirt treasure, and valued it above the lilies and roses which she missed, above the pearls and diamonds that she had never known. She looked forward to sharing the next summer in closest companionship with Joel. And in the interval what long, happy winter evenings the two should spend, with Mrs. Balls dosing peacefully in the chimney-corner, and Joel never too wearied by his work to be unable to talk, and who talked like Joel? As she worked then he would read to her from her books, or from new

books which their united wages might warrant them in buying.

How could Pleasance find leisure or inclination to mourn too persistently for the rough jewel, Long Dick? How could she keep up a vexatious struggle with the unkind resentment of Lizzie Blennerhasset at this epoch of her history? She was better employed with the preparations for her marriage, notwithstanding that these were greatly simplified by having no house to take and furnish. They were kept within the compass of the village where Pleasance bought such additional supplies to her wardrobe as she judged fit, at Mrs. Grayling's, whose shop had been the first house she had entered in Saxford.

Pleasance had a dim sense as of the shadow of Anne standing beside her, watching over her with sweet human interest still. Would Anne in the spirit blame this conclusive step by which Pleasance fulfilled her descent in worldly rank, and linked her fortunes to those of a working man?

Ah, no! Anne was raised far above worldly distinctions, and knew far better now. Even before she died, she had said with her last breath that the sisters might have been happy together if they had but been content with the commonest—and just because they are the commonest—the best, gifts of God our Father to his human children—with the love of each other, with youth, health, the blue sky above their feet, and the green earth beneath their heads.

As for Mrs. Grayling, she remarked in that lady's peculiar fashion, "Be you come to buy the wedding gownd from me, Pleasance? Wool! I d' be uplifted, sure-ly, seein' I thought that along on your flyin' so 'igh in your matin', you 'ould look clean over t' top on my poor shop, that you 'ould 'a silks and welwets from Cheam, or Norwich, or Lunnon die-rect."

Mrs. Grayling's observation was not made with the least reference to Clem and Lizzie Blennerhasset's secret. Clem in his caution had not extended his confidence or sought sympathy from those better able to bestow it than poor Lizzie proved herself nowadays. Neither had Mrs. Grayling any suspicion of her own, by which her natural unaided sagacity had enabled her to get at once to the bottom of what mystery there was to penetrate. Her comment was no more than a sardonic mode of expressing her opinion of Pleasance was making about the poorest marriage in her power, and that was saying a good deal.

But Pleasance was used to the trick of speech, and did not mind it. She rather liked it indeed as being racy, if not bland, and was stirred by it to say heartily, holding up her head as she spoke, "Yes, Mrs. Grayling, I have chosen well, so well that I could have dispensed with silks and velvets, even had they been for me."

In reality, Pleasance's preparations, however they might engross her, were very simple, yet they were made not only according to her own somewhat severe taste and judgment, but with a softened reference to that harmless hankering after vanity and gentility which she fancied she had detected in Joel. She bought no finery, but she added to the white ribbons for her straw bonnet a white gown of no flimsier material than dimity, and made in the plainest manner—since she had all her own way in the making when it was done by herself, after she could no longer command the services of Lizzie Blennerhasset.

"It is like yourself," Joel said, when he was informed of the material of his bride's wedding gown, showing himself entirely satisfied with her selection. "It is like everything you wear, the right thing in the right place, the proper gown for the morning service in the little village church with the thatch roof; and I take it that is the true art of dressing. A finer gown in such circumstances would only be pretentious and vulgar. I wish I could make as fit a choice. A bridegroom's suit is of little consequence, comparatively, still one would not sure look frightful when one was wed, any more than when one was dead; and I observe working men are rather fond of making guys of themselves on state occasions," ended Joel in a slightly discontented tone.

"Don't you go and make a guy of yourself," said Pleasance, thinking fondly in her private mind that the bright expressive face and light agile figure could not well, in any habiliments, offer the attributes of a guy. "Don't look out for such a cloth coat and sprigged waistcoat as those in which poor old Long Dick" (he was rapidly becoming old to her) "used to disfigure himself. Be yourself and at home, Joel, in your working clothes. I desire nothing better, I think nothing half so good."

"So be it," he said readily, in spite of his aspirations. "I'm fond of my working clothes. You have never seen me in any other. They are becoming, ain't they?" he demanded with boyish conceit. "I could not have worn a suit of Poole's to more purpose.

Any man who can work should be at home in working clothes. Any way I'll be myself, you may be sure, every inch of me, to marry you. But you'll have some flowers to wear with your white gown, Pleasance," he said, returning to his sheep, "were it but a sprig of myrtle in your breast. I know of a myrtle-tree from which, if I were only near it, I could get you a whole wreath."

"But what should I do with a wreath?" asked Pleasance, smiling indulgently. "A wreath would not be in my way."

"Well, no, I suppose not, since you are to wear a bonnet," yielded Joel reluctantly.

"Of course I am to wear a bonnet," said Pleasance. "Did you ever hear of a woman like me married in any other head-dress?"

"I don't know what you call 'like you,'"

Page 442.

he answered. "I am sure you are good enough to be crowned and veiled."

"Don't flatter," she said, while it was the brightness of her day that it was not flattery on his lips.

"But you must have flowers, Pleasance," he urged, resuming the attack. "Who ever heard of a marriage without flowers?"

"I have," said Pleasance, "many a time.

You must be dreaming, Joel. Where are flowers to come from in winter, for working people? You had better say favours next."

"No, I give up favours, and I can't say I regret them; but we must have flowers. Look here, Pleasance, I'll walk into Cheam the day before, and fetch you some from a florist's shop."

She looked graver. "I am afraid that

would belong to extravagance, Joel; it would be a pity for you to be one more whole day off work for such a trifle as flowers." It smote her to throw cold water on his loving gallantry; it tried her to infer that she was wiser than he; but certainly there was flightiness in him. Pleasance was not without an instinctive conviction, that, however clever he might be, however gifted with worldly experience, she was older in character. In the years which were to come she must exert her influence over him to steady him, as Long Dick had said she might do, and as her sister Anne had striven to steady her in the far-off childish days.

Joel was only half brought to his senses. "I'll send somebody over to Cheam, if you don't like my going myself. You are fond of flowers, I know."

"Yes, I am fond of flowers," admitted Pleasance cheerfully; "but I like best to look at and leave them growing. I think it is rather a waste and a pity to pull and wear roses and lilies, as the Saxford girls and lads wear them, at church and on holidays, carrying them in their hands, or sticking them into their bands and button-holes, where they wither so soon."

"You speak like a gardener, Pleasance," he said, laughing. "Gardeners always grudge their flowers, because they grudge their trouble in rearing them; but you wish to spare them because you have not had too many of them. What do you think of having plenty of flowers all the year round? How should you like to have a winter garden like this?" And he began to describe to her one of the most extensive and perfect private winter gardens in England—spacious, blooming galleries and halls, in which the climate of Italy and Egypt prevailed. And as one might have the flowers in the open air in Italy and Egypt during the months of November, December, January, and February, beds of sweet violets, cyclamen, jonquils, anemones, and ranunculus then bordered the pavement. Tuscan roses wreathed the white pillars. Camellias, oleanders, azaleas, and plumbago with lemon and orange trees, and even feathery palms, afforded fragrant foliage.

"It must be like fairy land, Joel," she said with ready acknowledgment of his eloquence. "Some day you'll take me to visit the Queen's garden; or is it a national garden, like those at the Crystal Palace and Kew? But, perhaps, it is a little too much like fairy land for poor humanity. I cannot think that I should care so much for flowers if I did not have to go without them some-

times. The Queen must miss the gladness of picking the first primrose."

"There you are with your philosophy," he cried in pretended impatience, "or is it philosophy or bigoted rusticity and east countrifiedness? No, it is pure pride. I tell you that I am afraid you are very proud, Pleasance."

He had often come over the assertion—almost harping upon it—that she refused to be a lady. And she had always adhered to her opinion, sometimes merrily. Holding up her brown, hardened hands she would inquire, were those a lady's hands? She would go on to imagine how they would look if she had to sit with them lying crossed in her lap! But for that matter she was too old a working woman ever to learn to sit still and idle; she would be always starting up and seeking something to do, taking it out of the servants' hands, upsetting the proprieties, disgracing herself, and disgusting everybody.

But whether merry or grave, she always stuck to her point that she had not the slightest longing or vocation to be a lady, and that nothing would have induced her to become a lady. Then he called her proud, the proudest woman, in her way, that he had ever known or heard of.

This day, for the first time, she took the accusation so far to heart that she put herself to some pains to show that the charge was erroneous. "No, indeed, I never was proud, Joel, not even as a child. Anne always said I wanted pride. It was Anne, not I, that Miss Cayley took to task for pride. Dear little Anne! She seems so little and so young, though she was my elder sister, to look back upon. It was hard for her, and I am afraid I was small help to her, who had helped me all our short lives. Next Sunday, Joel, you must come with me to her grave, and I shall tell you all that we came through when we were two poor young girls."

Accordingly on the following Sunday afternoon, when the Saxford population were fully engaged watching host Morse taking his wife for their hebdomadal drive, Pleasance and Joel passed into the little churchyard. In accordance with what existed as a pious custom among the young people of Saxford who were keeping company in the near prospect of marriage, the couple visited together the only grave of their kindred within reach.

The churchyard was deserted for the time. Even the Sunday scholars had been let loose for the day. But though the uneven paths had been frequented by strolling

groups of old and young, with neighbours leaning to converse over the crazy tombstones, as if the men and women had no other meeting-place, Joel Wray and Pleasance Hatton, on their particular errand, would have had their privacy treated with unusual respect.

The little mound, beneath which Anne's dust mouldered, had sunk nearly to a level with the ground itself, the scanty grass on it was bleached and withered, as Pleasance stood by it with the man whom she loved and was about to marry at her side, and prepared to tell him the cruel trials which had laid Anne low in the morning of her days.

Pleasance had outgrown some of the bitterness of the old anguish. She had ceased to say that their aunt Mrs. Wyndham had killed her sister. Pleasance had even learnt to apportion, however tenderly, a certain amount of weakness and error as Anne's share. For Pleasance had, in a remarkable degree for a woman, a strong sense of justice.

But in spite of the reservation, Pleasance could not tell how Anne and she had been rejected and thrust out, and how Anne had fallen and died in the first steps of their descent, without growing white, with set face and trembling lips. "It was all because my father made an unequal marriage, Joel," she ended. "You don't wonder that I set little store on his gentle birth, and that I cannot hold with ladies and gentlemen?"

He had been looking at her wistfully.

"I cannot wonder," he said quickly, and then he added, with a bursting heart, "But, oh! how you must have suffered, my darling!"

"It is all over now," she said; "Anne is at rest. I am happy. Let us speak no more of it." And they walked home in silence.

CHAPTER XXVII.—ARCHIBALD DOUGLAS.— THE STRANGER AT THE BROWN COW.

FROM the day of their engagement till this time, Joel had not vexed or disappointed Pleasance in a single instance.

It was not that she was blind. She was one of the women whose sight love does not blind, but clears. It was not that her love of power was gratified by the degree in which he deferred to her and complied with her every wish, quick to divine it, even when she did not express it in words. Once more, Pleasance belonged to the order of women who do not love power for itself, who even crave to be governed in minor matters, and only come to the front on exceptional occasions, without

meaning it or desiring it, simply because it is their call to do it, and they cannot help doing it.

Joel's impulses were good and kind, if rash and wilful, and if his unsuccessful rival could not refrain from making the admission, what ought not his mistress to think of her bridegroom, who, on his few weeks of probation, was the most considerate and tender of bridegrooms? Pleasance, who had known no peculiar cherishing love since she had lost Anne, now cried in secret with sheer blissfulness over this fond and deep love which had come to her. She thanked God for this prince and pearl among men, always reverent, always friendly with and concerned for his fellows, earnest to promote their welfare, relieve their burdens, and comfort their sorrows, Christian-like. He had spent a whole night, after his day's work, helping a poor, rheumatic old couple, who were obliged to change their house and had not the means to hire assistance, to remove their household goods. He had been caught in the act of reading a chapter of the Bible to Sammy Thwaite, the consumptive lad. And this was the man who had sought her out, and chosen her for his. Pleasance believed she did well to rejoice and give thanks out of a full heart.

Even in the question of the disposal of the first days after their marriage, he had, as was his wont, waved his inclinations when they interfered with her sense of duty and the claims of others.

He had pled at first that as marriage came only once to a man, he and Pleasance might spare a few days from their working lives to go away together, though it were no further than to the neighbouring coast or to the next village.

But Pleasance had urged the ungenial season, and what was to her the far more potent objection, Mrs. Balls's feeble health. In spite of her childish pleasure in the finishing touches being put to Pleasance's preparations, Mrs. Balls had been compelled to take to bed during those last weeks, and was unfit to be left to paid nursing, or to the good offices of her village friends. It should be as Pleasance liked then, he said; he could not bear that for his gratification her heart should be divided, or that she should be torn from filial services which she yearned to pay while she might.

But at last there came an occasion of Joel's trying Pleasance's faith in him, and even of his causing her acute pain. It was so close upon their marriage that

Joel was bound for the house of the parish clerk, to bid him put up the banns on the following Sunday. But first he sought an interview with Pleasance, and had it in the kitchen, where Mrs. Ball's once-active foot no longer sounded, and to which Pleasance came from the side of her cousin's bed in an upper room.

Joel stood with his back to the waning light, leaning against the huge table as she entered. He drew his hands from his pockets and took off his cap, which he was not in the habit of wearing after his entrance into a house, like many men of his class, but which he had retained in his absence of mind this day. Still he did not advance to meet her, and clasp her hands, or put his arms round her to take the privileged kiss as he was used to do, and he spoke with an accent of embarrassment. "Pleasance, do you remember what I said to you once, of my not being on terms with my people? My mother and sister?"

"Yes, Joel," she said; "do you think of taking this opportunity of making it up with them?"

It struck her that the idea was like him; and she resolved that on his thus coming to ask her to back him in the effort, he should not find her the woman who would stand out on her dignity, and be slow to comply with overtures of peace.

"Oh, no," he said hastily, "it would be worse than useless to attempt it at this moment. But I have something more to tell you about my quitting home and setting out on my adventures in the way I chose to do, without leaving any trace of me behind by which I could be followed, and written to, and generally badgered. I had to change my name. I could not have managed it otherwise."

"Change your name!" repeated Pleasance, startled.

"Yes, dear. Will it surprise you to hear that I am not Joel Wray—nothing so uncouth or quaint. I picked out the two names from the sign-board of a cart in a midland county, and made bold to appropriate them to serve my purpose, for a season?" he said, trying to speak playfully in order to mask his anxiety for the effect he should produce.

"But I do not quite understand," she said, colouring up, "why you should have had to change your name when you were your own master, and could work how and where you liked, in spite of your mother and sister's unwarrantable objections. It was such—such an

awkward—" she paused and corrected herself, and said straight out, looking him piteously in the face to show how it grieved her to say it—"it was such a wrong thing to do, forgive me for saying it, when it might expose you to misconceptions and mistakes."

"Yes, I grant an alias is apt to be a discreditable dodge," he admitted readily, not in the least angry with her for her remonstrance, nay, he proceeded to stroke the hair under the shadow of her cap, as he liked to do, with what seemed a reassuring touch in this instance, "but I could see no other way, and I thought it was admissible."

She looked up into his frank, penitent eyes, and listened to his clear, confiding voice, which had lost its trouble even while he spoke, and she fully believed that he had only adopted a doubtful resource because he had taken into his head that it was necessary. Still it disturbed her, that he should do what might well draw down on him suspicion and doubt. He was very good, but he was also strangely careless and imprudent, and he did not see his enormities in their proper light. He was proceeding with considerable coolness, and certainly quite happily. The first brush of the announcement which he had required to make, was over, and it had not seriously impaired her great trust in him, or led to grave results for which he was not then equal. He went on to tell her that he could not marry her under an assumed name, that he must marry her under his own name, that she might be assured to him as he to her. And was she not curious to learn what his real name, which she was to bear—so soon too—would sound like?

"I shall never like it nearly so well as Joel Wray," said Pleasance, half sadly, half reproachfully, in the natural, but partly amused indignation of her superior discretion at his boyish folly.

"What! Not if it be my name, my real name, and not a bad name as names go! It is of Scotch origin, for my father came of a Scotch stock which had crossed the Borders. You won't hurry me, Pleasance, you won't press for the name which I have a great mind to keep in the dark a little longer, till the clerk reads it out in church, a big mouthful—Archibald Douglas."

"Archibald Douglas!" said Pleasance, faintly, with a trying sense of its strangeness. "I have heard it before—read of it in Sir Walter's novels and his 'Tales of a Grandfather.' There were great old tyrants of Scotch earls of that name."

"Ah, but I am no tyrant, and the name

has come down in the world since then," said he, laughing, "like more earls' names."

"I shall not know how to say it," said Pleasance, bemoaning her peculiar difficulty, half in earnest, half in jest. "It is like having another man—a man I have never known given me for my husband, and I could never consent to that. I shall always be saying Joel. And what will the folk about think?"

"You can call me Joel till you learn to say Archie. As for the people here, they are used to nicknames, or handles to names, like 'Long Dick,' and 'Host Morse.' They hold me a queer fish, they will judge it is one of my queer ways to have a couple or more names at my disposal, and they will care no more about it."

The villagers did very much as he had said. After the shock of hearing Pleasance Hatton's banns read out to another than Joel Wray, the explanation was a comparative relief. Perhaps they were more accustomed to aliases than Pleasance was, and did not regard them exactly in the same light. Perhaps the men and women who were occupied every day of their lives with intensely practical concerns, did not stop to consider aliases as an abstract question, and viewed one name as being as good as another. There was only a little talk, a few exclamations.

"Lor', he be'nt Joel Wray as 'a been livin' along on us and known as sich! He be one Arch'bald Dooglas, arter all! And Madam she d' be goin' to be Missus Dooglas, and none on Missus Wray! But when it d' come to thatten, she 'ont be Missus anythink, certain sure, on'y 'Madam' so long as her lives in them parts, and sets herself up to wear glasses."

The sole protest which the natives made against the irregularity of the proceeding was in their continuing obstinately to call the delinquent Joel Wray the same as before.

But Pleasance, from the moment that he told her the truth, strove with a blush rising on her cheek to substitute Archie for Joel, or if Joel slipped out to correct the lapse quickly, and supply Archie instead.

"All right, Pleasance, never mind," he would protest lightly, and declare, "I shall always like Joel from you, because it reminds me of the first time that I heard you say it."

"But it was not your real name all the time, Archie," she reminded him with unconscious severity. She sighed again over the strangeness of that Archie, and over the inclination to vagary which seemed the one spot on her sun—at the same time she consoled herself with the lustrous integrity of that sun

in which so small a flaw became conspicuous by its very singularity.

Pleasance's wedding day was anticipated, by the occurrence at Saxford of another event, in itself quite sufficient to mark a special occasion.

Few travellers took Saxford on their way. Decent working men on the tramp, as Joel Wray had been, vendors of baskets and crockery of a high enough grade to ply their traffic by means of carts drawn by horses or donkeys, agents for such small retail businesses, drovers and cattle and horse dealers come to inspect the neighbouring stock, were the chief visitors. Elections were of exceptional occurrence, and even elections in so limited an agricultural district, with the interest sure for Lawyer Lockwood's master, Sir Frederick, brought little stir to the isolated village.

The east country did not afford attractions for artists and their umbrellas. Yet glorious old English artists who did not know such umbrellas had been born in it, and had remained very faithful to it, never wearying of depicting its broad lights, its slow rivers with their heavy barges, its high bits of heath with their windmills, its old inns and cottages, its green meadows and sandy lanes. But such artists as were brought to the neighbourhood by its traditions, confined themselves now-a-days to the coast or the Broads.

Saxford lying out of the beaten track, did not even draw many professional strollers of the Punch and organ class, for these turned aside to Cheam.

The Brown Cow was mostly self-supporting, that is, it drew its principal receipts from the habitual beer-drinking of the village itself, eked out by the little inn's being the occasional summer resort of the company at bean-feasts and cricket matches.

The sight of a traveller who belonged to none of the accredited classes, who came alone, so late as on an afternoon in October, driving over in a cab from the Cheam station, and thus giving positive proof that he was a gentleman of independent habits and means, was a rare God-send to Saxford. He had directed that his portmanteau and dressing-case—in themselves elegant appurtenances fit for the vicarage at least—should be carried into a private room, and followed the direction by a hesitating request whether he could get accommodation for more than the night.

It did seem that in Saxford, as elsewhere, it never rained but it poured. Here was an incident which might have supplied the gossips, male and female, with a subject for a week's discussion; yet it must be followed close—

before it could be properly digested—by another equally exciting event, for this was the eve of Joel Wray and Madam up at the Manor's wedding day. At other times nothing would happen, not even a pig-killing, not a hero like Long Dick's going off to seek his fortunes over the hills and far away, for months on end.

Host Morse was naturally considerably impressed by the unexpected grist to his mill, and was prepared to pour forth on the guest all the host's approved qualities of boisterous joviality and jocularly. But after having pulled on his best coat—a tight fit,—brushed up the hair with both hands from his red shining face, and rushed up the narrow steep stair with a nimbleness which did credit to his years and stoutness, host Morse reappeared and descended slowly, in a state of collapse to throw over the distinguished visitor on the missus as her business, and to retire to the bar as his proper sphere, 'there to brag and swagger about "the swell as the missus were a servin' hup stairs."

Mrs. Morse, who had already faithfully flown from the society of her friend Mrs. Biennchasset, to her post in the kitchen, rose to the occasion. She put on her meekest face, with her meekest cap stuck full of modest little daisies, and entered the alarming presence. She smoothed down her apron and besought the gentleman to please say what he "'ould 'a," and it should be got for him, "if so be it could be 'ad," giving the phrase with an expression as if she anticipated the stranger would ask for a roc's egg, yet felt bound to comply with his request, though she should go to the ends of the earth, and come off with a dead loss as a hostess, to compass it.

The gentleman who had quenched host Morse stood in the long low-roofed parlour between its two batteries of gentility—an engraving of her Majesty the Queen of Great Britain and Ireland, in a gilt frame, and a flower composed of shells, under a glass shade. Though he was the most loyal of subjects and a lover of art, he gazed from the one object to the other with lack-lustre eyes. "Ah," he said, with a slight defect in his speech amounting to hesitation when he was agitated—"Ah! my good woman, get me anything you can, dinner, tea, or supper."

The look of helpless forlornness with which the gentleman contemplated the position, the air of hopeless resignation with which he submitted to circumstances, as if they were too far removed for him ever to dream of their being brought into harmony with his tastes and inclinations, were almost too much

for Mrs. Morse as they had proved for her husband.

The visitor was a tall lank man, in a travelling suit of brown Tweed. He showed the signs, unmistakable even to such unaccustomed eyes as those of host Morse and his wife, of super-refinement, with the shyness which sometimes accompanies it, and which becomes distressing in middle age. He was as scared by the Morses as they could be by him; and it was this evident trepidation, along with the equally evident distress and incapacity to cope with the surroundings, that silenced host Morse's patronising volubility, and went near to upsetting Mrs. Morse's sly modesty.

But as the gentleman stood with his chin—aristocratic by dint of its shape—in the air, his pale blue eyes blinking with uneasy horror at the shabby engraving of the Queen, and the ugly petrification of the shell flower—his aquiline nose sniffing involuntarily in an additional disquieting sense that the windows of the parlour of the Brown Cow could not have been open for a week, Mrs. Morse recovered herself.

"Please, sir, if you will say now more pertickler what you will 'a, it will perwent reflections bum bye," she suggested, with the softest deference.

He had not the most distant intention of reflecting on the people, though he knew that he was horribly uncomfortable. He shrank from giving trouble. He was totally unaware which of the meals he had mentioned would be most in season at this hour in an establishment like that of the Brown Cow, though he could have been depended upon to give an accurate account of the feeding-times of the ancient Romans and Greeks. If he fixed on, say dinner, which came natural to himself at the close of the day, it would be another penalty to him to particularise the dishes without a bill of fare—such a bill of fare as could be conceived of at the Brown Cow. And always to intensify his trouble, his eyes were fascinated by that shameful travesty of her gracious Majesty's lineaments, and that painful parody of the most inoffensive, refreshing thing in nature, even if it came from a cit's lawn or a cottager's gardener—a nosegay.

"Ah! anything, anything, my good woman, ma'am"—he did not even know how to address her, without probably hurting her feelings, and he hated to hurt anybody's feelings. "Anything you have. A rasher" (with a bright flash of recollection out of some novel he had read)—"ah—or bread and cheese."

"We be rather better perwided than that, sir," said Mrs. Morse, with gentle reproach, that cut the wretched man to the heart. "We 'a a roast on beef in the larder, likewise a pigeon-pie, and we 'a fowls in the yard, in coorse, with heggs for a custard, if required."

The only effect produced on the stranger by Mrs. Morse's proudly-humble enumeration was a conviction that somehow it was a reproach to him, which he hastened to get rid of, by saying—

"That will do. The pigeon-pie" (he was dyspeptic, and never ate pies), or the custard with, ah—a slice of bread and a glass of milk; and the same will serve for my breakfast to-morrow morning," he added, on a sudden impulse to get over his penance and have done with it at once. "I shall want nothing besides, save a bed and a bath."

"I shall see to your bed, sir, as how it is haired and warmed with my own 'and," said Mrs. Morse, like a woman who knows her duties and does them, and who forgives and recompenses with good her worst enemies; "but there ain't no baths to be 'ad here, 'cept folks goes to the Broad for en. We don't go in with tubbin' in the house, not but for chil'ren," said Mrs. Morse, casting her eyes on the ground, to avoid the contemplation of the impropriety of her generation, and so to repress her just indignation.

"Oh, very well; never mind," assented the gentleman with the utmost swiftness, seeing that there was yet a deeper slough of despond into which he had to descend. He must not only go without his bath, for the first time within his knowledge, but submit to an inference from a woman that he, the most decorous of men, was guilty of impropriety in his mode of daily ablution.

Mrs. Morse went down-stairs and allowed herself to say to Mrs. Blennerhasset, who had followed her friend to see if she could render any help, that if ever woman had been tried "with a stuck-up old fool as were goin' to do nothin' for the good of the house," she had been. But she had given him as good as she had got, and she was not going to complain—no one ever heard her complain, or make, or meddle. All that she wished was to live and let live, to keep a quiet house and do her duty by Morse, "as left things" to her, "and sat and hectored and soaked hisself in the bar;" but it was the way of the world and of men. To all which self-evident propositions and admirable sentiments Mrs. Blennerhasset agreed fervently.

After his dinner, or supper, the stranger strolled out, and picked his steps, as he

wandered aimlessly about the village, glancing nervously at the bold starers who met him at every turn, and shook what equanimity was left in him. He came always back to the inn door, looking wistfully as if he would like to speak to one or other of the men hanging about it and the smithy, but invariably retreating from the encounter when it became imminent. He seemed as miserable out of doors as in.

At last the stranger took courage and made up, as it happened, to Ned, the junior man at the Manor farm, standing the image of heavy good humour and reflected importance, to be trotted out by all his acquaintances in turn, on the doings that were to take place at the Manor-house next day.

"Ah!" said the gentleman, touching his hat first, to the bewilderment of Ned, who made no movement to return the salutation, "horses and cattle are your staple production here, I suppose?"

"I s'pose they be, zur," said Ned sheepishly, without the most distant conception what "staple production" meant, but satisfied that he could not be wrong in agreeing with a gentleman. He was occupied, wondering why the dickens he was selected to be spoken to by the stranger, when so many better men—smith Blennerhasset and others—were close at hand. Ned did not know whether to feel flattered or aggrieved by the distinction.

"And I conclude that you have a resident population—not many changes going on among you, eh?" continued the stranger, taking heart to prosecute his inquiries.

"Cheanges?" said Ned. "No, there be'nt many cheanges," he repeated like a clumsy echo.

"Not many strange work-people coming and going?" persisted the gentleman.

"No," answered Ned; "but there d' be such a oner at our farm."

"Indeed!" exclaimed the limp questioner, straightening himself up and speaking almost sharply. "What sort of fellow, eh? Excuse my curiosity."

"Oh, no offence," said Ned politely. "He were a wery spry chap, though town-bred, were Joel Wray, from the fust; and now he d' be to be married to-morrer."

The listener's interest, kindled the instant before, sank down with the mention of the name, and at the volunteered information of Joel Wray's immediate promotion to the rank of a Benedict, it died out entirely. He abandoned what appeared to him the fruitless subject of Joel Wray, and though he

made an effort to resume his quest in a general direction, it was with a return to his previous flurried dispiritedness. "You know of no other odd man—job man, come here lately, and taking a turn at work in the neighbourhood?"

"I knows on none, zur," said Ned, positive when he was convinced that his knowledge, in its slender amount, could not be mistaken, "and there could not be none, not atween Broad Ends and Cheam, atout me hearin' tell on en."

"I have been at both these places, thanks," said the gentleman with languid laconicness, turning away without vouchsafing any explanation of his questions.

He re-entered the inn, stealing stumbly up-stairs, not to attract attention, or trespass more than he could help against the customs of the natives. He shut himself into the low-roofed dining-parlour, with its coarse drugget carpet, horse-hair chairs, the distressingly defective and damaged engraving of her Majesty, and the monstrosity of a shell-flower. He was full of the painful impression that, though he were to stay months in this strange region and investigate the minutest detail, he should find in the end that he had come to the wrong place, and had been enduring all this bodily and mental purgatory for worse than nothing, since he should have been losing his time and sowing warning traces of himself and his errand wherever he tarried.
